“At seven o'clock A. M. (continues Mr Fergusson, in his “Notes”), we embarked in the North America, a splendid steam-boat, of which the Americans are justly proud, to proceed up the Hudson to Albany, a distance of 145 miles. The morning was rather cold, and a strong breeze blew down the river, wind, and tide, and stream, being all against us, notwithstanding of which, the irresistible power by which we were impelled landed us in Albany within fourteen hours. It is difficult for those who have never seen an American steam-boat, to conceive its elegance and comfort. They are handsomely fitted up, well furnished, and a capital table is kept, while the total absence of coal-smoke leaves every thing tidy and clean. The North America is a day-boat, that is, she performs her voyage between sunrise and sunset, a circumstance of which travellers ought to be aware, as they may deprive themselves of the enjoyment which the highly interesting scenery of the Hudson affords, should they chance to go unawares by an evening boat. This fine vessel is propelled by two engines of ninety horsepower each; the steersman, from an elevated platform in the fore-end, guides the vessel by ropes which communicate with the rudder; a safe and admirable contrivance, universally employed in America, enabling the person at the helm to command an uninterrupted view of the ship's course, and to escape many dangers which might otherwise occur. The North America has a magnificent public cabin, with suitable private accommodation for ladies. Her length is about 225 feet, and her breadth 60. There are a lower and upper deck for promenading, with an awning when the sun is powerful, and, in short, every luxury and comfort which the best hotel could afford, not forgetting the barber's shop, where the master informed me he had frequently the honour of taking fifty gentlemen by the nose in one forenoon. This ancient craft, so greatly degenerated in our own country, seems to be here in its very zenith. Innumerable are the party-coloured poles in every town, indicating the barber's shop, and, the general practice being favourable to their calling, they are in great request. I observed, in New York, one of the sides of the shop fitted up with pigeon holes, where stood the labelled soap-boxes of Mr A, Mr B, &c., indicating steady customers. The steam-boats and large hotels have generally a barber as part of the establishment, and I found them every where maintaining the old professional character of cleanly, civil, and obliging gossip.

The fare to Albany is only 9s. 6d., and a very moderate charge for meals. Of course, it is a favourable mode of conveyance, and the company is not always remarkably select. The steward told me he had nine hundred passengers to breakfast and dinner one day last summer, and that 500 or 600 are frequent. With such a multitude some confusion must unavoidably occur, however excellent the arrangements, and these appeared to me to be very complete. Upon this occasion I think we sat down about 200 at table; many homely enough in appearance, but nothing either rude or revolting came under my notice. I was seated at dinner between Judge S—, a very intelligent man, and of much repute as a lawyer, and a plain Massachusetts farmer. We soon got engaged in agricultural conversation, for the judge was well versed in these matters, and afforded much useful advice and information to the professional farmer and his friends. After dinner he entered into more general discussion, running over the different States, and pointing out to me what he considered their relative advantages and draw-backs. He thinks well of Ohio and some parts of Indiana for European settlers, and strongly advised me, if I thought of a purchase, to prefer a farm already, in some measure, improved, and to be upon my guard against designing persons, who are every where on the look-out for strangers. He assured me that a good understanding with Great Britain was daily gaining ground in the States, and that the idea prevailed, that if the two nations stand by each other, they may rule the world.

I had a long chat with the Massachusetts farmers, who had been at New York with a drove of fat oxen, weighing about 75 stones (14 lb. to the stone) each, and for which they had got about L.22 a-head. They were in high spirits, as every thing was bearing a high price. Their sheep are Saxon and Merino, and they had refused 2s. 8 1/2d. 75 cents per pound for their wool, while last year they considered themselves well paid with 2s. 1d. 50 cents. They raise fine crops of turnips, and rear many sheep. A ewe fetches this season 9s., while last year she brought only 4s. 6d. They pay a sheep-

doctor 27s. each 100 sheep per annum for his attendance, and this man devotes himself to sheep alone, never interfering with any other stock. He came out to them from England.

Our dinner table was supplied with a profusion of good things, well cooked, and neatly served up. The captain takes the head of the table, the ladies who have no gentlemen along with them being always under his special charge; and, however large the party, or however mixed the company, scrupulous deference is paid to the accommodation of the fair; and, I am confident, the most unpolished farmer would suffer any inconvenience rather than interfere with a lady's comfort.

The fare from New York to Albany, 145 miles, is, as before observed, two dollars, or 9s. 6d., and the charge for an excellent dinner 2s. 3d., or half a dollar, including brandy, whisky, and Hollands, placed upon the table, at the discretion of the company—a latitude which, I may here observe, was never abused, upon this or any other occasion, throughout my tour. The scenery of the Hudson, between New York and Albany, is probably not to be surpassed in romantic beauty by any river scenery in the world. About forty miles above New York, the river emerges from the high lands, and, for 100 miles above that, the eye is gratified by a succession of lofty mountains, and bold rocky headlands, clothed in wood—towns, villas, farms, &c. in perpetual succession. The river itself is a noble object, covered with innumerable sloops and steamers, sometimes making abrupt turns amongst the rocks, and again stretching out like a peaceful lake.

Albany is an ancient city in American chronology. It is the capital of the State of York, and the seat of the State government, though now greatly eclipsed by *The City*, as New York is emphatically termed. A great proportion of internal commerce centres in Albany. The Grand Erie, and the Champlain, or northern canal, both find their outlet here, and numerous very large steam-boats ply to New York. The population of Albany is about 16,000. The tide runs nearly to Troy, about six miles above. In contemplating the commercial enterprise, the busy buzz of men, the large warehouses and stores, the variety of equipages, waggons, stage-coaches, &c. which are met on every hand, as a stranger proceeds through the city, it is impossible not to revert to the pictures so graphically drawn by an amiable and venerable authoress, and to contrast its present condition with the early days of Albany. “When this city was a kind of semi-rural establishment, every door had its garden, well, and a little green behind; before every door a tree was planted, rendered interesting by being coeval with some beloved member of the family; many of their trees were of prodigious size, and extraordinary beauty, but without regularity; every one planting the kind that best pleased him, or which he thought would afford the most agreeable shade to the open portico, at his door, which was surrounded by seats, and ascended by a few steps. It was in these that each domestic group was seated in summer evenings to enjoy the balmy twilight, or the serenely clear moonlight. Each family had a cow, fed in the common pasture, at the end of the town. In the evening the herd returned altogether, of their own accord, with their tinkling bells hung at their necks, along the wide and grassy street, to their wonted sheltering trees, to be milked at their masters' doors. Nothing could be more pleasing to a simple and benevolent mind than to see thus at one view all the inhabitants of a town, which contained not one very rich, nor one very poor, very knowing or very ignorant, very rude or very polished, individual; to see all these children of nature, enjoying, in easy indolence or social intercourse,

‘The cool, the fragrant, and the dusky hour,’

clothed in the plainest habits, and with minds as undisguised and artless. These primitive beings were dispersed in porches, grouped according to similarity of years and inclinations. At one door were young matrons; at another the elders of the people; at a third, the youths and maidens, gaily chatting or singing together, while the children played round the trees, or waited by the cows, for the chief ingredient of their frugal supper, which they generally ate, sitting on the steps in the open air.” It is a sketch not unworthy of Rip Van Winkle himself. The mighty tide of time is ever rolling on, and such scenes as these must now be looked for in the newly reclaimed regions of the west, or the Canadian forest, where many an embryo city, destined to rear its edifices, and to diffuse riches and civilization around, is at this hour commencing its career with the saw-mill, the grist-mill, and the wooden wharf.

The local situation of Albany is very fine, the town being placed upon the declivity of a hill, overhanging the river on its western bank; and the panoramic view from the roof of the Capitol is beautiful and extensive, embracing the Catskill mountains, nearly 4000 feet high, clothed with wood to the very summit, the noble Hudson, spreading out below, and a fine country on every side.”—*Agricultural Journal*.

EDINBURGH: Published by WILLIAM and ROBERT CHAMBERS, Booksellers, No. 19, Waterloo Place. Sold also by JAMES CHAMBERS, 48, North Hanover Street, and by all other Booksellers in Edinburgh and every other Town in Scotland.

Subscribers in Town may have the Paper left at their houses every Saturday morning, by giving their addresses at 19, Waterloo Place. Price of a quarter of twelve weeks, 1s. 6d.; of a half year of twenty-four weeks, 3s.; and of a year, 6s. 6d. In every case payable in advance.

In LONDON, an Edition is published, with the permission of the Proprietors, by W. S. ORN, Patefoster-row, for circulation throughout England, Wales, and Ireland.

Stereotyped by ALEX. KIRKWOOD, North St Andrew Street, And printed by W. RITCHIE, & Co. Edinburgh.

SATURDAY, MAY 19, 1832.

PRICE THREE HALFPENCE. 1

FITS OF THRIFT.

NOTHING is more common in the middle ranks of life than to find housewives taking what may be called *fits of thrift*. Though sensible women in their way, excellent advisers and charming gossipers, and though by no means spenders on a great scale, they have no enduring principle of economy, but are only frugal by fits and starts. They take qualms of thriftiness now and then—sometimes from reading a string of plausible receipts for cookery on a cheap scale, or from being struck with the excellent arrangements in the household of a friend, who tells her, that, by managing in such and such a manner, salting all her own beef, and making all her own preserves, she has, one way and another, saved a good deal of money, which is really a thing of some consequence in these bad times, when so little is coming in. This chronic frugality is common to single ladies, under, as well as above one-and-twenty, and to married ladies with large families. The fits have different tendencies, although the prevailing symptoms are the same. Occasionally the furor seizes one single young lady in a family of sisters; and I have seen that it comes on most commonly in the spring. In such cases the disease perhaps takes the direction of butter and eggs. Some day about the month of April or May, and when breakfast is on the table, the young lady begins to make observations on the dearth and rancidity of the butter. I declare for my part, says she, we have been poisoned for the last six months with that stuff that we get from the woman who keeps the little shop in the area on the opposite side of the street. You know it was only out of pity to her when her husband was burnt to death at the distillery, that we said that we would take some small things from her; but you see she does not keep wholesome articles, and really, in my opinion, it is high time we were looking about for something we can trust to. With this sort of discourse the young notable opens the plan of her campaign. She says she is resolved to rise every morning at seven, and go with a basket herself to the market. The mornings, she says, are now greatly lengthened out, and, besides saving a penny a pound on the butter, and getting a better article, she is confident the walk will prove of great benefit to her health. It may always be observed that the husband, father, or elder brother of the notable, never makes any objections when such schemes of saving are propounded. They know intuitively that the whole is a delusion, which will work itself off in a week or two; that the same disease has visited the family once every year about the same period ever since they can recollect, and that it will now, as formerly, only furnish a little harmless temporary excitement in the house. Armed with a negative approval from these relations, together with a pound note, the young notable starts next Saturday morning between seven and eight o'clock, and after taking half an hour to array herself in an undress, studiously selecting for the occasion a shabbyish shawl, and a pair of shoes that she puts on only on "bad days," also a straw bonnet faded both in the material and in the ribbon, she sallies forth with her basket to the market. With what an air of knowingness she goes from cart to cart, examining, and tasting, and smelling their contents! How she tries to elicit, by cross-questioning the man in the sky-blue coat, or the blowsy girl in the dimity head-gear, sitting amidst their savoury boxes with leather hinges, every particular in the history of the butter; where and when it was made, and why it happens to be up this morning, and so forth. How she wanders amidst the egg women, holding up the eggs between her and the light, asking if they be sure they are not Orkney

eggs, and what their probable age may be? What with toiling up and down the market for three quarters of an hour, and beating down the prices in a most exemplary manner, she at last accomplishes her purchases, and brings home her cargo of native produce. When you come down to breakfast, you will be at once reminded of what has been going on, by the air of superiority and triumph assumed by Miss Notable. She thinks that by rising an hour sooner than any body else, and saving, as she thinks, the sum of two-pence, she has purchased the character of a thrifty personage, and, consequently, is entitled to look down upon the whole house. There is no end to her account of how she managed to find out the best butter in the cart, and how she higgled the man out of a halfpenny in the pound. When she places a slice of this extraordinary butter before you, she takes care to show you how fresh the colour is, and waits with impatience to hear your expected, and not to be dispensed with, praise of its taste. The butter she has bought is, in fact, her pet for the whole week. She considers it as *her* butter; and if any visiter slight it, by not paying it the necessary compliments, he is of course not indebted to her for any future invitation to the house.

A fit of thrift of this nature lasts generally three or four weeks, seldom more. I have seen it continue a fortnight in tolerable strength; it then declines, and wears off towards the fourth Saturday. The decline of this household disease is as amusing in its way as its increase. The young lady begins to find, that, so far from improving her health or strength by such morning exercise, she only "makes herself out," and is unfit to do any thing else the whole day. And then it is, after all, only to save a few halfpence. She also finds that her purchases do not always turn well out, and that she cannot coax her father, or the rest of them, to be perpetual admirers of her butter and eggs. As a get-off, she commences a eulogy on her butter, which, she says, is sold by a man in Rose Street—a person who was once a farmer, but was reduced by misfortunes to open a small shop in the town, and sell dairy produce. This man, she says, is *experienced* in butter, and imports every week as much as will serve a dozen families. She has made interest with him through the servant to be counted one of his regular customers, and he will supply the family at all times exactly at the market price, not a farthing more. This new plan helps greatly as a solace to the conscience in abandoning her morning airings with her basket and dishabille; and so she gradually subsides into the ordinary routine of domestic arrangements.

The married notable is subject to fits of thrift in a greater or less degree about the months of October and November. Some day at dinner, when there happens to be rather a poorish leg of lamb on the table, and not much else, she opens her attack by saying, in a peevishly authoritative manner, that really the family has been long enough on fresh meat; that, for her part, the lamb that they have had so often does not agree with her, and that she would rather prefer a good salt herring. "Mrs Lockhart has just been telling me that the doctor has advised them to eat twice or thrice a-week a piece of salt meat—that is to say, a piece of beef newly powdered, just the fresh taste off it, and hardly having the appearance of the saltpetre at the bone; and I do think that we cannot do better than just follow such a sensible man's advice, and get two or three pieces next Wednesday for salting—you know it will be a great saving of money." The drift of all this is, that the husband shall forthwith exhibit on the table a couple of twenty shilling notes; but as he knows that these handy pieces of paper are sometimes not

very easily got, he perhaps tries to throw an obstacle or two in the way of the salting project, and, for instance, mentions that his wife has no convenience for curing beef. You observe, says he, it requires a tub, or something of that sort, and, besides, there is a great knack in curing the meat thoroughly; and if you do not take care, you will spoil the whole. As a matter of course, these or similar observations cannot hold good in the face of a wife under a fit of thrift. All you can say is borne down, and the money is at length consigned with a groan to the steel purse of the good lady, who, next day—for she is in the fidgets till her purpose is executed—sets out in her muff and shawl (the first time for the season) on an expedition, first to lay in her beef, and then to buy a sufficient and commodious *salting can*. Well, the *can*, that darling object of a notable's ambition, is purchased. The beef is salted; and the Goodman and his family are shortly put on salt meat, whether they like such fare or otherwise. The thrifty lady all this time takes care, on every occasion, to show off her beef as well worthy of being tasted by visitors; and the short and long of it is, that the said beef is eaten up in half the time it is expected to last; fresh meat begins to show itself more frequently at your table, and the fit is put aside till another opportunity occur of playing it off.

These are very ordinary instances of fits of thrift; but there are hundreds of the same description which I could mention. Sometimes the fit takes the direction of a new gown for going out with on bad days, to save others of a better sort; at another time it is "a house gown," as "really my best black silk one is absolutely getting wasted with having to go so often into the kitchen." Occasionally it is the hiring of two maid-servants, "so that the washings need not any longer be given out;" at other times it is the buying of a crumb-cloth, to save the carpet, or the purchasing of loads of old china and crockery at auctions. I have seen all the ladies in the house manifest this phrenzy by working their own lace, or painting pictures which had to be hung in dear gilded frames. Again, I have noticed it in great vigour in a family in town resolving to have a garden, so as to grow their own vegetables. It comes on very frequently in a desire to dye old ribbons, or feathers, or "dress" shawls; in which case the lady who is affected sets out on a voyage of discovery through all the obscure courts and alleys about the town, seeking for some old woman whom they have heard of as being "the best" at these processes of renovation. It may be remarked, that the fit visits the nation, like an epidemic, towards the end of July. Almost every house in the kingdom is then thrown into an uproar by the ladies, young and old, confederating to manufacture gooseberry jam or currant jelly. Such a requisition is there then in all quarters for "brass pans," and such a deal of money is spent in this popular confectionery! At the approach, and during the continuance of the epidemic, the husbands very wisely make no remonstrance, well knowing that such would be utterly thrown away. You know, my dear, would say the thrifty spouse, we shall require at least two dozen pints this season; for nothing is more useful in a house, in case of colds; and you will remember how much good a spoonful or two did little George last February, when we thought he was going to take the fever; indeed the doctor said it had been the very saving of his life. Nothing, of course, can withstand an appeal to such authority; so the money is disbursed for the purchase of the fruit and other materials, although the Goodman never can exactly see how some pounds' worth of jelly should be laid up in store, all for the sake of needing two teaspoonfuls.

Sometimes the family is so unfortunate as to get

an oven, and a particularly economical Miss undertakes to bake what is called family bread. A great saving is expected from this source; but it soon turns out that so much of the article is given away to friends, as a kind of curiosity, or to impress them with a sense of the economy practised in the house, that a great deal more is lost than gained by the novelty. In fact, it always turns out, as in the case of the Vicar of Wakefield and his thrice notable spouse, that these chronic economists are not observed to make their husbands any richer by their contrivances, so much is lost by the expense of the experiment, compared with what is gained by the short duration of the practice.

POPULAR INFORMATION ON LITERATURE.

SECOND ARTICLE.

OUR first article under this title embraced the principal Poets now alive, but who have ceased to publish poetry: the present will run over a few of those who are still in active poetical life, or have more recently aspired to poetical honours.

Decidedly the first active poet of the age is FELICIA HEMANS, a married lady verging upon middle life, who first came into public notice about twelve or fourteen years ago. Mrs Hemans has not published any long or elaborate poem. Her efforts are chiefly confined to brief lyrical pieces, developing generally one particular train of sentiment. Her poems have almost all appeared in periodical works, chiefly the *New Monthly* and *Blackwood's Magazines*; and it is somewhat remarkable that, while a single piece invariably has a most delightful effect when read amidst the other details of such works, they never have made any impression when collected into a distinct volume. Her volumes, "*Songs of the Affections*," and "*Records of Woman*," are understood to have had a very limited circulation, partly owing, no doubt, to the difficulty of publishing a volume of poetry, but mostly to the diminished effect which the fair authoress produces when many of her productions are read at one sitting. Mrs Hemans is eminently the poet of the affections—the female affections especially; she is high priestess of the nobler emotions of woman's heart. It is in describing what woman has done and suffered on greatly trying occasions, that her harp gives forth its most thrilling tones. At the same time, whatever there is meek, whatever there is holy, whatever there is pure, whatever there is beautiful in ordinary domestic life, becomes in her hands more meek and holy, more beautiful and pure, and is committed in that state to her verses. Mrs Hemans resides, we believe, chiefly in London, and is very much respected in private life.

JAMES HOGG is another of the active poets of the age, and perhaps the most wonderful of them all. Born in the cottage of a shepherd, in one of the most rude and sequestered parts of Scotland, he received hardly any education till his twentieth year. The whole of his early life was spent in the condition of a shepherd, amidst his native mountains; and if it had not been perhaps for the legendary poetry which was occasionally recited to him by his mother, his mind might have never received the impulse of song. At the beginning of the present century, when about thirty years of age, he was discovered by Sir Walter Scott, who was then collecting the materials of his *Border Minstrelsy*, and to whom he was pointed out as a young man who knew many old ballads. In the course of a few years he was gradually led from his solitude into the bustle of the capital, where he published a few volumes of his poetical compositions, without, however, meeting with great success. At length, in the year 1813, appeared his greatest work, the *Queen's Wake*; a series of poems in the ballad style, strung into a narrative of a singularly captivating nature. This volume established Mr Hogg's reputation upon an imperishable basis. As a whole, and in its parts, it was alike felicitous, novel, and beautiful. In one of the ballads, styled "Kilmory," an entirely new string, one of wild and melancholy grace, seemed added to the Scottish lyre. In the latter part of his literary history, Mr Hogg has not been so successful; but no failures in poetry or prose will ever cloud the lustre of that meritorious effort. It is the ambition of Mr Hogg to rival the fame of Burns; but there is no earthly reason why he should ever match his strength against that illustrious man, except the mere accident of his having been also born a Scottish peasant. The poetry of Mr Hogg is as original in its own way as that of Burns; and he therefore ought to endeavour rather to avoid than to court comparison with his predecessor. There is only one feature in which we should like to see him imitate the *Ayrshire Bard*—namely, that self-respect, which, amidst every external contamination, preserved even for the poor exciseman an essential personal dignity, and was alike effectual in repelling the familiarity of the mean, and the more intolerable patronage of those who affect to be exalted.

Mr Hogg has, in later life, attempted the profession of a store-farmer in his native valleys; but, not having met with success, he now resides upon a small farm, which has been generously gifted to him for life by the great territorial lord upon whose property he was born—the Duke of Buccleuch. He has just commenced a republication of his prose tales in a series of cheap volumes; and when we reflect upon the amusing nature of these stories, disfigured though they be by numberless instances of false taste, and the most glaring improbability, we cannot entertain any doubt of their renewed popularity. In the autobiography which he has prefixed to this series, he makes a confession of his feelings almost as unreserved as that of Rousseau; and among other traits of character, mentions that he delights in nothing so much as to write about himself. This is a curious acknowledgment; but if other poets were equally unconcerned about personal respect, we might see it oftener made. The truth is, vanity and egotism are at the bot-

tom of most literary exertions, and modesty is only another word for indolence. The most of literary characters, if dissected, would be found to exhibit an intense self-appreciation, side by side with the loftiest and most extended powers of reflection; and, were it otherwise, the faculties useful to mankind would in general be lost. Mental power, indeed, appears as if it often required to be set in a rather inferior character, in order to be developed—as the pearl is only found in the shell of the diseased fish. But this is a subject which would require to be treated by itself.

The present age cannot boast of many other poetical names of distinguished merit. Miss LONDON, perhaps better known by her initials L. E. L., a young lady of the metropolis, has published four volumes of poetry, respectively entitled the *Improvisatrice*, the *Troubadour*, the *Golden Violet*, and the *Venetian Bracelet*. Besides these, she has been a large contributor to the periodicals of the day, especially the *Literary Gazette*, in which, indeed, her powers were first developed. Miss London's poetry is of an amorous and chivalric cast, replete with the tenderest sentiment and the most romantic association, but perhaps too often expressed in a melancholy or despairing tone. Next may be mentioned Mr BAYLEY, author of many modern popular songs, an imitator of Moore, without his perpetual glitter, but with a great deal of more genuine sentiment. There is a whole herd of lesser lights, whom we must leave to struggle a little farther forward before we advert to their efforts.

TRADITIONARY STORY OF ANNANDALE.

THE predatory incursions of the Scots and English borderers, on each other's territories, are known to every one in the least acquainted with either the written or traditional history of his country. These were sometimes made by armed and numerous bodies, and it was not uncommon for a band of marauders to take the advantage of a thick fog or a dark night for plundering or driving away the cattle, with which they soon escaped over the border, where they were generally secure. These incursions were so frequent and distressing to the peaceable and well-disposed inhabitants, that they complained loudly to their respective governments; in consequence of which some one of the powerful nobles residing on the borders was invested with authority to suppress these depredations, under the title of *Warden of the Marches*. His duty was to protect the frontier, and alarm the country by firing the beacons which were placed on the heights, where they could be seen at a great distance, as a warning to the people to drive away their cattle, and, collecting in a body, either to repel or pursue the invaders, as circumstances might require. The Wardens also possessed a discretionary power in such matters as came under their jurisdiction. The proper discharge of this important trust required vigilance, courage, and fidelity; but it was sometimes committed to improper hands, and consequently the duty was very improperly performed.

In the reign of James V. one of these wardens was Sir John Charteris of Amisfield, near Dumfries, a brave but haughty man, who sometimes forgot his important trust so far as to sacrifice his public duties to his private interests.

George Maxwell was a young and respectable farmer in Annandale, who had frequently been active in repressing the petty incursions to which that quarter of the country was exposed. Having thereby rendered himself particularly obnoxious to the English borderers, a strong party was formed, which succeeded in despoiling him, by plundering his house and driving away his whole live stock. At the head of a large party, he pursued and overtook "the spoil-encumbered foe;" a fierce and bloody contest ensued, in which George fell the victim of a former feud, leaving his widow, Marion, in poverty, with her son Wallace, an only child, in the tenth year of his age. By the liberality of her neighbours, the widow was replaced in a small farm; but by subsequent incursions, she was reduced to such poverty that she occupied a small cottage, with a cow, which the kindness of a neighbouring farmer permitted to pasture on his fields. This, with the industry and filial affection of her son, now in his twentieth year, enabled her to live with a degree of comfort and contented resignation.

With a manly and athletic form, Wallace Maxwell inherited the courage of his father, and the patriotic ardour of the chieftain after whom he had been named; and Wallace had been heard to declare, that although he could not expect to free his country from the incursions of the English borderers, he trusted he should yet be able to take ample vengeance for the untimely death of his father.

Although his own private wrongs and those of his country had a powerful influence on the mind of Wallace Maxwell, his heart was susceptible of a far loftier passion.

His fine manly form and graceful air had attractions for many a rural fair; and he would have found no difficulty in matching with youthful beauty, considerably above his own humble station. But his affections were fixed on Mary Morrison, a maiden as poor in worldly wealth as himself; but nature had been more than usually indulgent to her in a handsome person and fine features; and, what was of infinitely more value, her heart was imbued with virtuous principles, and her mind better cultivated than could have been expected from her station in life; to these accomplishments were superadded a native dignity, tempered with modesty, and a most winning sweetness of manner. Mary was the daughter of a man who had seen better days; but he was ruined by the incursions of the English borderers; and both he and her mother dying soon after, Mary was left a helpless orphan in the twentieth year of her age. Her beauty procured her many admirers; and her unprotected state, for she had no relations in Annandale, left her exposed to the insidious temptations of unprincipled villany; but they soon discovered that neither flattery, bribes, nor

the fairest promises, had the slightest influence on her spotless mind. There were many, however, who sincerely loved her, and made most honourable proposals; among whom was Wallace Maxwell, perhaps the poorest of her admirers, but who succeeded in gaining her esteem and affection. Mary and he were fellow servants to the farmer from whom his mother had her cottage; and on account of the troublesome state of the country, Wallace slept every night in his mother's house as her guardian and protector. Mary and he were about the same age, both in the bloom of youthful beauty; but both had discrimination to look beyond external attractions; and although they might be said to live in the light of each other's eyes, reason convinced them that the time was yet distant when it would be prudent to consummate that union which was the dearest object of their wishes.

A foray had been made by the English, in which their leader, the son of a rich borderer, had been made prisoner, and a heavy ransom paid to Sir John, the warden, for his release. This the avaricious warden considered a perquisite of his office; and it accordingly went to his private pocket. Soon after this, the party who had resolved on ruining Wallace Maxwell for his threats of vengeance, took the advantage of a thick fog during the day, succeeded by a dark night, in making an incursion on Annandale, principally for the purpose of capturing the young man. By stratagem they effected their purpose; and the widow's cow and Wallace her son were both carried off as part of the spoil. The youth's life might have been in considerable danger, had his capture not been discovered by the man who had recently paid a high ransom for his own son, and he now took instant possession of Wallace, resolving that he should be kept a close prisoner till ransomed by a sum equal to that paid to the warden.

It would be difficult, if not impossible, to say whether the grief of Widow Maxwell for her son, or that of Mary Morrison for her lover, was greatest. But early in the ensuing morning the widow repaired to Amisfield, related the circumstance to Sir John, with tears beseeching him, as the plunderers were not yet far distant, to dispatch his forces after them, and rescue her son, with the property of which she had been despoiled, for they had carried off every thing, even to her bed-clothes.

Wallace Maxwell had some time before incurred the warden's displeasure, whose mind was not generous enough either to forget or forgive. He treated Marion with an indifference approaching almost to contempt, by telling her that it would be exceedingly improper to alarm the country about such a trivial incident, to which every person in that quarter was exposed; and although she knelt to him, he refused to comply with her request, and proudly turned away.

With a heavy and an aching heart, the widow called on Mary Morrison on her way home to her desolate dwelling, relating the failure of her application, and uttering direful lamentations for the loss of her son—all of which were echoed by the no less desponding maiden.

In the anguish of her distress, Mary formed the resolution of waiting on the warden, and again urging the petition which had already been so rudely rejected. Almost frantic, she hastened to the castle, demanding to see Sir John. Her person was known to the porter, and he was also now acquainted with the cause of her present distress; she therefore found a ready admission. Always beautiful, the witness of her air, the liquid fire which beamed in her eyes, from which tears streamed over her glowing cheeks, and the perturbation which heaved her swelling bosom, rendered her an object of more than ordinary interest in the sight of the warden. She fell at his feet and attempted to tell her melancholy tale; but convulsive sobs stifled her utterance. He then took her unresisting hand, raised her up, led her to a seat, and bade her compose herself before she attempted to speak.

With a faltering tongue, and eyes which, like the lightning of heaven, seemed capable of penetrating a heart of adamant, and in all the energy and pathos of impassioned grief, she told her tale—implored the warden, if he ever regarded his mother, or if capable of feeling for the anguish of a woman, to have pity on them, and instantly exert himself to restore the most dutiful of sons, and the most faithful of lovers, to his humble petitioners, whose gratitude should cease only with their lives.

"You are probably not aware," said he, in a kindly tone, "of the difficulty of gratifying your wishes. Wallace Maxwell has rendered himself the object of vengeance to the English borderers; and, before now, he must be in captivity so secure, that any measure to rescue him by force of arms would be unavailing. But, for your sake, I will adopt the only means which can restore him—namely, to purchase his ransom by gold. But you are aware that it must be high; and I trust your gratitude will be in proportion."

"Every thing in our power shall be done to evince our gratitude," replied the delighted Mary; a more animated glow suffusing her cheek, and her eyes beaming with a brighter lustre—"Heaven reward you."

"To wait for my reward from heaven, would be to give credit to one who can make ready payment," replied the warden. "You, lovely Mary, have it in your power to make me a return, which will render me your debtor, without in any degree impoverishing yourself!"—and he paused—afraid or ashamed to speak the purpose of his heart. Such is the power which virgin beauty and innocence can exert on the most depraved inclinations.

Although alarmed, and suspecting his base design, such was the rectitude of Mary's guileless heart, that she could not believe the warden in earnest; and starting from his proffered embrace, she with crimson blushes replied—"I am sure, sir, your heart could never permit you so far to insult a hapless maiden; you have spoken to try my affection for Wallace Maxwell; let me therefore again implore you to take such measures as you may think best for obtaining his release;" and a fresh flood of tears flowed in torrents from her eyes, while

she gazed wistfully in his face, with a look so imploringly tender, that it might have moved the heart of a demon.

With many flattering blandishments, and much artful sophistry, he endeavoured to win her to his purpose; but perceiving that his attempts were unavailing, he concluded thus—"All that I have promised I am ready to perform; but I swear by heaven, that unless you grant me the favour which I have so humbly solicited, Wallace Maxwell may perish in a dungeon, or by the hand of his enemies; for he shall never be rescued by me. Think, then, in time, before you leave me; and for his sake, and your own future happiness, do not foolishly destroy it for ever."

With her eyes flashing indignant fire, and her bosom throbbing with the anguish of insulted virtue, she flung herself from his hateful embrace, and, rushing from his presence, with a sorrowful and almost bursting heart, left the castle.

Widow Maxwell had a mind not easily depressed; and although in great affliction for her son, did not despair of his release. She was ignorant of Mary's application to the warden, and had been revolving in her mind the propriety of seeking an audience of the king, and detailing her wrongs, both at the hands of the English marauders and Sir John. She was brooding on this, when Mary entered her cottage, and, in the agony of despairing love and insulted honour, related the reception she had met from the warden. The relation confirmed the widow's half-formed resolution, and steeled her heart to its purpose. After they had responded each other's sighs, and mingled tears together, the old woman proposed waiting on her friend the farmer, declaring her intentions, and, if he approved of them, soliciting his permission for Mary to accompany her.

The warden's indolent neglect of duty was a subject of general complaint; the farmer, therefore, highly approved of the widow's proposal, believing that it would not only procure her redress, but might be of advantage to the country. He urged their speedy and secret departure, requesting that whatever answer they received might not be divulged till the final result was seen; and next morning, at early dawn, the widow and Mary took their departure for Stirling. King James was easy of access to the meanest of his subjects; and the pair had little difficulty in obtaining admission to the royal presence. Widow Maxwell had in youth been a beautiful woman, and, although her early bloom had passed, might still have been termed a comely and attractive matron, although in the autumn of life. In a word, her face was still such as would have recommended her suit to the King, whose heart was at all times feelingly alive to the attraction of female beauty. But on the present occasion, although she was the petitioner, the auxiliary whom she had brought, although silent, was infinitely the most powerful pleader; for Mary might be said to resemble the half-blown rose in early summer, when its glowing leaves are wet with the dews of morning. James was so struck with their appearance, that, before they had spoken, he secretly wished that their petitions might be such as he could with justice and honour grant, for he already felt that it would be impossible to refuse them.

Although struck with awe on coming into the presence of their sovereign, the easy condescension and affability of James soon restored them to comparative tranquillity; and the widow told her "plain, unvarnished tale" with such artless simplicity and moving pathos, as would have made an impression on a less partial auditor than his Majesty. When she came to state the result of Mary's application to Sir John, she paused, blushed, and still remained silent. James instantly conjectured the cause, which was confirmed when he saw Mary's face crimsoned all over.

Suppressing his indignation, "Well, I shall be soon in Annandale," said he, "and will endeavour to do you justice. Look at this nobleman (pointing to one in the chamber); when I send him for you, come to me where he shall guide. In the mean time, he will find you safe lodgings for the night, and give you sufficient to bear your expenses home, whither I wish you to return as soon as possible, and be assured that your case shall not be forgotten."

It is generally known that James, with a love of justice, had a considerable share of eccentricity in his character, and that he frequently went over the country in various disguises—such as a pedlar, an itinerant musician, or even a wandering beggar. These disguises were sometimes assumed for the purpose of discovering the abuses practised by his servants, and not unfrequently from the love of frolic, and, like the Caliph in the Arabian Tales, in quest of amusement. On these occasions, when he chose to discover himself, it was always by the designation of the *Gudeman of Ballengeich*. He had a private passage by which he could leave the palace, unseen by any one, and he could make his retreat alone, or accompanied by a disguised attendant, according to his inclination.

On the present occasion he determined to visit the Warden of the March *in cog*; and, making the necessary arrangements, he soon arrived in Annandale. His inquiries concerning the widow and Mary corroborated the opinion he had previously formed, and learning where Mary resided, he resolved to repair thither in person, disguised as a mendicant. On approaching the farmer's he had to pass a rivulet, at which there was a girl washing linen, and a little observation convinced him it was Mary Morrison. When near, he pretended to be taken suddenly ill, and sat down on a knoll, groaning piteously. Mary came instantly to him, tenderly inquiring what ailed him, and whether she could render him any assistance. James replied it was a painful distemper, by which he was frequently attacked; but if she could procure him a draught of warm milk, that and an hour's rest would relieve him. Mary kindly said, if he could with her assistance walk to the farm, which she pointed out near by, he would be kindly cared for. She assisted him to rise, and, taking his arm, permitted him to lean upon her shoulder, as they crept slowly along. He met

much sympathy in the family, and there he heard the history of Mary and Wallace Maxwell (not without execrations on the warden for his indolence), and their affirmations that they were sure, if the King knew how he neglected his duty, he would either be dismissed or severely punished: although the former had spoken plainer than others whom James had conversed with, he found that Sir John was generally disliked, and he became impatient for the hour of retribution.

Marching back towards Dumfries, James rendezvoused for the night in a small village called Duncow, in the parish of Kirkmahoe, and next morning he set out for Amisfield, which lay in the neighbourhood, disguised as a beggar. Part of his retinue he left in Duncow, and part he ordered to lie in wait in a ravine near Amisfield till he should require their attendance. Having cast away his beggar's cloak, he appeared at the gate of the warden's castle in the dress of a plain countryman, and requested the porter to procure him an immediate audience of Sir John. But he was answered that the warden had just sat down to dinner, during which it was a standing order that he should never be disturbed, on any pretence whatever.

"And how long will he sit?" said James.

"Two hours, perhaps three; he must not be intruded on till his bell ring," replied the porter.

"I am a stranger, and cannot wait so long; take this silver groat, and go to your master, and say that I wish to see him on business of importance, and will detain him only a few minutes."

The porter delivered the message, and soon returned, saying, "Sir John says that however important your business may be, you must wait his time, or go the way you came."

"That is very hard—there are other two groats; go again, and say that I have come from the Border, where I saw the English preparing for an incursion, and have posted thither with the information; and that I think he will be neglecting his duty if he do not immediately fire the beacons and alarm the country."

This message was also carried, and the porter returned with a sorrowful look, and shaking his head.

"Well, does the warden consent to see me?" said the anxious stranger, who had gained the porter's good will by his liberality.

"I beg your pardon, friend," replied the menial, "but I must deliver Sir John's answer in his own words: he says if you choose to wait two hours he will then see whether you are a knave or a fool; but if you send another such impertinent message to him, both you and I shall have cause to repent it. However, for your civility, come with me, and I will find you something to eat, and a horn of good ale to put off the time till Sir John can be seen."

"I give you hearty thanks, my good fellow; but, as I said, I cannot wait. Here, take these three groats; go again to the warden, and say that the *Gudeman of Ballengeich* insists upon seeing him immediately."

No sooner was the porter's back turned than James winded his bugle-horn so loudly, that its echoes seemed to shake the castle walls; and the porter found his master in consternation, which his message changed into fear and trembling.

By the time the warden had reached the gate, James had thrown off his coat, and stood arrayed in the garb and insignia of royalty, while his train of nobles were galloping up in great haste. When they were collected around him, the king, for the first time, condescended to address the terrified warden, who had prostrated himself at the feet of his sovereign.

"Rise, Sir John," said he with a stern and commanding air. "You bade your porter tell me that I was either knave or fool, and you were right, for I have erred in delegating my power to a knave like you."

With a faltering tongue and a quivering lip the warden attempted to excuse himself, by stammering out that he did not know he was wanted by his majesty.

"But I sent you a message that I wished to speak with you on business of importance, and you refused to be disturbed. The meanest of my subjects has access to me at all times; I hear before I condemn; and shall do so with you, against whom I have many and heavy charges."

"Will it please your majesty to honour my humble dwelling with your presence, and afford me an opportunity of speaking in my own defence?" said the justly alarmed warden.

"No, Sir John, I will not enter beneath that roof as a judge, where I was refused admission as a petitioner. I hold my court at Hoddam Castle, where I command your immediate attendance; where I will hear your answer to the charges I have against you. In the meantime, before our departure you will give orders for the entertainment of my retinue, men and horses, at your castle, during my stay in Annandale."

The king then appointed several of the lords in attendance to accompany him to Hoddam Castle, whither he commanded the warden to follow him with all possible dispatch.

Sir John was conscious of negligence, and even something worse, in the discharge of his duty, although ignorant of the particular charges to be brought against him; but when ushered into the presence of his sovereign, he endeavoured to assume the easy confidence of innocence.

James proceeded instantly to business, by inquiring if there was not a recent incursion of a small marauding party, in which a poor widow's cow was carried off, her house plundered, and her son taken prisoner; and if she did not early next morning state this to him, requesting him to recover her property.

"Did you, Sir John, do your utmost in the case?"

"I acknowledge I did not; but the widow shall have the best cow in my possession, and her house furnished anew; I hope that will satisfy your Majesty."

"And her son, how is he to be restored?"

"When we have the good fortune to make an English prisoner, he can be exchanged."

"Mark me, Sir John! If Wallace Maxwell is not brought before me in good health, within a week from this date, you shall hang by the neck from that tree waving before the window. I have no more to say at present; be ready to wait on me in one hour when your presence is required."

The warden knew the determined resolution of the king, and instantly dispatched a confidential servant, vested with full powers, to procure the liberation of Wallace Maxwell, at whatever price, and to bring him safely back without a moment's delay. In the meantime, a retinue of men and horse, amounting to several hundred, were living at free quarters in Sir John's castle, and the visits of the king diffusing gladness and joy over the whole country.

Next morning James sent the young nobleman, whom he had pointed out to the widow at Stirling, to bring her and Mary Morrison to Hoddam Castle. He received both with easy condescension; when the widow, with much grateful humility, endeavoured to express her thanks, saying that Sir John had, last evening, sent her a cow worth double that she had lost; also blankets and other articles of higher value than all that had been carried away; but, with tears in her eyes, she said all these were as nothing without her dear son, assuring them that their request had not been neglected. James dismissed them, with the joyful hope of soon seeing Wallace, as he would send for them immediately on his arrival.

The distress of the warden increased every hour, for he was a prisoner in his own castle; and his feelings may be conjectured, when he received a message from the king commanding him to come to Hoddam Castle next day by noon, and either bring Wallace Maxwell along with him, or prepare for a speedy exit into the next world. He had just seen the sun rise, of which it seemed probable he should never see the setting, when his servant arrived with Wallace, whose liberty had been purchased at an exorbitant ransom. Without allowing the young man time to rest, Sir John hurried him off to Hoddam Castle, and sent in a message that he waited an audience of his Majesty.

To make sure of the youth's identity, the king sent instantly for his mother, and the meeting called forth all the best feelings of his heart, for maternal affection triumphed over every other emotion; and it was only after the first ebullition of it had subsided, that she bade him kneel to his sovereign, to whom he owed his liberty, and most probably his life. Wallace gracefully bent his knee, and took heaven to witness that both should be devoted to his majesty's service.

James was delighted with the manly appearance and gallant behaviour of Wallace; and after having satisfied himself of the sincerity of his attachment to Mary, he ordered him to withdraw.

He next dispatched a messenger for Mary, who, the moment she came, was ushered into the presence of Sir John; James marking the countenance of both—that of Mary flushed with resentment, while her eye flashed with indignant fire. The pale and deadly hue which overspread the warden's cheek was a tacit acknowledgment of his guilt. "Do you know that young woman, Sir John? Reply to my questions truly; and be assured that your life depends upon the sincerity of your answers," said the king, in a determined and stern voice.

"Yes, my liege, I have seen her," said Sir John, his lip quivering and his tongue faltering.

"Where?"

"At Amisfield."

"On what occasion?"

"She came to me for the release of Wallace Maxwell."

"And you refused her, except upon conditions which were an insult to her, and a disgrace to yourself. Speak; is it not so?"

"To my shame, my sovereign, I confess my guilt; but I am willing to make all the reparation in my power; and I leave it to be named by your majesty."

"You deserve to be hanged, Sir John; but when I look on that face I acknowledge your temptation; and it pleads a mitigation of punishment. You know that Mary loves and is beloved by Wallace Maxwell, whom you have already ransomed; you shall give him a farm of not less than fifty acres of good land, rent free, during his life, or that of the woman he marries; and farther, you shall stock it with cattle, and every article necessary, with a comfortable dwelling;—all this you shall perform within three months from this date. If you think these conditions hard, I give you the alternative of swinging from that tree before sunset. Take your choice."

"My sovereign, I submit to the conditions, and promise that I shall do my best to make the couple happy."

Wallace was now called in, when Mary clasped him in her arms, both falling on their knees before their sovereign. He raised them up, and said, "I have tried both your loves, and found them faithful. Your Mary is all that you believed her, and brings you a dowry which she will explain. I shall see your hands united before I leave Annandale, and preside at the feast. Let your care of the widow be a remuneration for what she has done for both, and I trust all of you will long remember the *Gudeman of Ballengeich's* visit to Annandale."

SCOTTISH MANUFACTURING DISTRICTS.

SCOTLAND possesses its manufacturing districts as well as England, and the degree of industry and ingenuity displayed in the latter country now meets with a parallel in this northern kingdom. The comparatively recent rise and rapid progress of manufactures in Scotland well merit attention. The prospe-

* The above tale is reprinted from the *Edinburgh Literary Gazette*, July 4, 1829.

city of the country in this branch of its affairs is coeval with the revival of agriculture, and may be dated within the period of a century. England had its extensive cloth and other manufactures in the reign of Henry the Seventh; Scotland had not made the same advances till the reign of George the Third; yet such have been the activity and care bestowed on its manufactures within the period of the last seventy or eighty years, that in many processes of labour it already rivals its more favoured and more precocious sister nation. It may justly be said that no country in the world—the United States of America excepted—has made such extraordinary strides in the career of prosperity, in all that concerns it, as Scotland. Under the manifest disadvantages of a worse climate than is found in the greater part of England; a mountainous uneven territory, ill adapted for roads and canals; an unfortunate local situation, rather out of the way of European commerce; a most serious want of capital; and a recent rise from barbaric usages and the affliction of civil broils—it has fallen upon judicious means, through the energy of its character, of establishing a reputation highly worthy of respect, and of placing itself as much as possible on a par with its southern neighbour. There are some countries—Ireland for instance—where the mechanism of society, and every thing relative to national institutions, trade, and commerce, are continually going wrong; whereas in Scotland no beneficial practice has ever yet been introduced, from the epoch of Malcolm Canmore downwards, which has not readily taken root and been a source of national advantage and gratulation.

The principal manufacturing district in Scotland is that of Lanark and Renfrew shires, lying on the western side of the island, and intersected by the Clyde. The manufacture of lawns, cambrics, and other articles of a similar fabric, was introduced into this district about a century ago, but was not of any moment till the decade of 1770-80. A very flourishing commerce with the American colonies having then been checked, the attention of the trades of Glasgow was directed to other objects of enterprise; and being assisted by the discovery made by Arkwright of the improved process of spinning cotton wool, they commenced the manufacture of muslins. The late Mr James Monteith of Anderston was the first person who warped a muslin web in Scotland. The progress of the cotton manufacture at Glasgow after this was very rapid; dyeing and printing linen and calico were brought fully into practice; and soon the goods of Glasgow were exported to all parts of the world. Since the use of steam power commenced in Glasgow, about 180 engines, having the power of at least 3000 horses, and in the proprietary of upwards of 150 manufacturers, have been established within two miles of the Cross of that city. The cotton manufacturers of Glasgow have also water mills and establishments in a number of places throughout the adjoining country, and the goods they produce rival those of the Lancashire manufacturers. The manufactures of Paisley, in Renfrewshire, differ from those of Glasgow. About the year 1760, the making of silk gauze was first attempted in Paisley in imitation of those of Spitalfields. The success was beyond the most sanguine expectations of those who engaged in it. The inventive spirit, and the patient application of the workmen, the cheapness of the labour at the time, and the skill and taste of the masters, gave it every advantage for being naturalized there. The consequence was, that nice and curious fabrics were devised, and such a vast variety of elegant and richly ornamented gauze was issued from the place, as to outdo every thing of the kind that had formerly appeared. Spitalfields was obliged to relinquish the manufacture, and companies came from London to carry it on in Paisley, where it prospered, and increased to an inconceivable extent. In 1784 the manufacture of silk gauze, lawn, and linen gauze, and white sewing thread, amounted to the value of L.580,000, and no fewer than about 27,000 persons were employed. Since that epoch the gauze trade has declined: but the manufacture of cotton thread, cambric, shawls of silk and cotton, shawls of silk and Merino wool, scarfs, plaids, Canton crape shawls, and handkerchiefs, has risen, and been carried on with more or less vigour. The manufactures of Glasgow and Paisley engage the labour of a dense population, scattered over the whole of the villages in the west of Scotland, and reaching even into more distant parts of the country. The outlet for those manufactures is chiefly by the Clyde and by Greenock. The increase of the population of Glasgow and Paisley within the last fifty years has been very striking. In 1780 the city of Glasgow contained only 42,332 individuals; and in 1831 it possessed a population of nearly 233,000. Paisley and its environs in 1782 contained 17,700 inhabitants; in 1831 the population was nearly 60,000.

Lanarkshire has a variety of other manufactures; machinery to a great extent is made at Glasgow, and there are iron works in the upper vale of Clyde, within the shire. In an alpine region of Lanarkshire and Dumfriesshire, amidst a wilderness of heathy mountains, lie the villages of Leadhills and Wanlockhead, both celebrated for their lead-mines. The annual produce of the Scotch lead-mines is 65,000 bars, or 4120 tons, which, at the value of lead, on an average of the last twenty years, amount to L.82,400.

Let us now proceed to other parts of Scotland. Dumbartonshire is now the seat of a number of print-

works, which have been established on the Leven, in consequence of the exceeding purity of its water,

“That sweetly warbles o'er its bed,
With white round polished pebbles spread.”

The county is likewise noted for the manufacture of glass for windows, both plate and common, an article begun to be made here in 1777. The glass-works of Dumbarton give employment to 19,000 tons of shipping, and pay from L.40,000 to 60,000 of excise duties per annum. Ayrshire, which is contiguous to Renfrewshire, has for a number of years taken the lead in woollen manufactures. The chief seat of this trade is at Kilmarnock, a rapidly improving town, possessing a population of about 18,000. In this thriving inland town about 1200 weavers and 200 printers are engaged in the manufacture of harness and worsted printed shawls, which are annually produced to the value of L.200,000. In the manufacture of Brussels, Venetian, and Scottish carpets and rugs, the quality and patterns of which are not surpassed by any in the country, there are upwards of 1000 weavers employed. The annual amount of this important branch of manufacture cannot be less than L.100,000. The town is noted for the manufacture of striped woollen night-caps and bonnets; of the latter, 224,640 are made yearly, the value of which is L.12,090. Kilmarnock is also a mart for boots and shoes; about 2400 pairs are made every week, three-fourths of which are for exportation; annual value about L.32,000. The thriving village of Stewarton, in Ayrshire, enjoys a large share of the manufacture of Highland bonnets, regimental and otherwise. A considerable portion of the population of this county is engaged in weaving for the Glasgow and Paisley manufacturers. Ayrshire has other two articles of manufacture worth mentioning—iron and snuff-boxes. The seat of their manufacture is at Muirkirk, where there are blast furnaces for pig iron, and an extensive forge for bar iron. The pig iron made here is soft, easily melted, and of the best quality. The bar iron is superior to any in Britain, and not inferior to Swedish iron. There are also some coal tar works at Muirkirk. Cumnock, a village in the heart of Ayrshire, on the Lugar water, is celebrated for the manufacture of those beautiful wooden snuff-boxes now so common, a species of trade carried on nowhere else in Scotland, except at Laurencekirk and Montrose. It is little more than twenty years since some ingenious individuals commenced the making of these curious little cabinets. There are now upwards of one hundred persons, men, women, and children, employed in the trade, all of whom get more considerable wages by their labour than most other artisans. Planetree is the wood used in the manufacture, and great ingenuity is evinced in adorning the lids with devices. The very nice manner in which the hinges are constructed, so as to be almost invisible, is deserving of the highest credit. It is calculated that a piece of rough wood, costing only twenty-five shillings, will make three thousand pounds' worth of snuff-boxes.

Stirlingshire has some manufactures peculiar to itself. These consist of carpets, coarse woollens of divers kinds, tartans and cottons, which are principally made in the town of Stirling, and the adjacent villages of St Ninians and Bannockburn. There are also establishments at different places for manufacturing paper, copperas, alum, Prussian blue, soda, and whisky. Some of the villages are celebrated for the excellence and quantity of the nails which they manufacture; and the article so produced has long had a command of the Scottish market. But the grand staple manufacture of Stirlingshire is iron goods, cast and malleable, at Carron, on the banks of the river of that name, near Falkirk. This establishment, which is celebrated all over Europe, manufactures all kinds of cast-iron goods, for use in war, agriculture, domestic economy, or any other purpose. Cannon, mortars, howitzers, and carronades, of every description, are here made in the greatest perfection. The outlet for these heavy goods is the Frith of Forth, or the canal which communicates with the Clyde. Including those employed in the works, and those engaged in the mines and pits, with the individuals employed in the coasting and carrying trade, the whole will amount to between 2000 and 3000 persons, who subsist directly by the works.

No county in Scotland surpasses Fifeshire in point of industry, general intelligence, and comfort. This peninsular county (including part of Kinross-shire) is the busy seat of the Scottish linen manufacture, which was introduced into it about sixty years since, when the London trade was opened up. In the course of the intervening period of time, the county has been overspread with spinning-mills, bleach-fields, weaving-rooms, and other essentials for carrying on a great trade. From time to time, considerable changes have occurred, according as the demand for particular articles varied; and in the present day the weaving of fine diapers and shirtings is the chief employ. Some of the most meritorious improvements in the art of bleaching and hand-weaving have been the discovery of natives of Fife. Dunfermline, in this county, enjoys the reputation of being the first town in Scotland for fine linens. The yarns used are from foreign flax, and are mostly spun and bleached on the river Leven. The Kirkland spinning-mills, near the seaport town of Leven, are the most extensive in the county. In the weaving of linens, whole towns, vil-

lages, and hamlets, are constantly employed. The cloth produced is, for the greater part, exported to London, as the Scotch themselves wear almost none of their own goods, being contented with the cheaper linens of Ireland. Blankets and plaidings are also manufactured in this shire. The operative weavers of Fife form an independent respectable class of artisans, thoroughly national in their habits and sentiments; and being, in most instances, provided with gardens and potato grounds, if not pigs and cows, near their cottages, they live in a state of peace and comfort, I venture to assert, nowhere equalled, at least not surpassed, among the working classes in any portion of the united kingdom. In no part of the country are there seen fewer idlers, fewer ill-clad people, or fewer public houses—solid testimonials of the sobriety, the industry, and the intelligence of the natives.

Forfarshire, which lies immediately north from Fife, has the chief trade in manufacturing coarse flaxen and hempen goods, principally from Baltic produce. The seat of this lucrative branch of manufactures is at Dundee, a town which, like Paisley and Glasgow, has made extraordinary advances within the last fifty years. Brown linen, sailcloths, bagging, and coarse household stuffs, are the staple branches. In the year ending Whitsunday 1830, the exports of lint and hempen goods amounted to 464,752 tons. The wealth diffused by a commerce of such magnitude may well be conceived to be great. Steam power is applied very extensively at Dundee, and all the towns and villages within many miles are kept busily engaged in weaving. Dundee is also famous for the excellence of its manufacture of kid gloves.

In that portion of Scotland lying betwixt the Borders and the Frith of Forth, manufactures are thinly scattered. Hawick in Roxburghshire began to manufacture woollen stockings in 1771, and since that period it has risen to be the chief town in this line in Scotland. There are now upwards of twenty manufacturers in the place, and these employ between five and six hundred looms. It was lately calculated that there were about 900,000 pounds weight of fine wool spun into yarn, three-fifths of which were wrought up into hose, &c., and the remainder sold to manufacturers of stockings in Leicester, Derbyshire, Glasgow, &c. Galashiels, a small thriving town in Selkirkshire, has for a number of years been making considerable advances in the manufacturing of cloths, plaidings, flannels, hosiery, &c. The town had recently ten woollen mills, or factories, which wrought about 30,000 stones of wool per annum, value L.22,000. The cloth made here is remarkably strong and durable.

The district of Mid-Lothian, of which Edinburgh forms the centre, has a great variety of manufactures. Printing papers are now made to a vast extent at a number of mills on the Esk and other streams; pottery and salt are made at the towns on the shore of the Frith of Forth; glass or crystal is made to a large amount at Leith; and among other manufactures, those of refined sugar, ale, beer, leather, and chemical preparations, have a conspicuous place. The Edinburgh ales are deservedly celebrated; its silk shawls are also well known; and it has recently put forth some of the finest carpets. Edinburgh is, however, chiefly known as a mart for literary productions. Though not employing a dense population like Lanarkshire, the county possesses those vital principles of action which enable it to put the whole machinery of improvement in motion over the kingdom. Its banking establishments supply capital to nearly the whole of Scotland, and rouse the spirit of industry in the most distant isles.

BIOGRAPHIC SKETCHES.

SIR RICHARD ARKWRIGHT

THE biography of James Watt, a man to whom mankind has been greatly indebted for the ingenious improvements he effected on the steam engine, having been brought under the notice of my readers, I now propose to give some account of Sir Richard Arkwright, an individual in some measure associated with the great inventions of Watt; his rise from a very humble origin to affluence and distinction being the result of his persevering attention to the improvement of machinery connected with the cotton manufacture.

“Arkwright (says his biographer, in the Library of Entertaining Knowledge) was born on the 23d of December 1732, at Preston, in Lancashire. His parents were very poor, and he was the youngest of a family of thirteen children; so that we may suppose the school education he received, if he ever was at school at all, was extremely limited. Indeed, but little learning would probably be deemed necessary for the profession to which he was bred—that of a barber. This business he continued to follow till he was nearly thirty years of age; and this first period of his history is of course obscure enough. About the year 1760, however, or soon after, he gave up shaving, and commenced business as an itinerant dealer in hair, collecting the commodity by travelling up and down the country, and then, after he had dressed it, selling it again to the wig-makers, with whom he very soon acquired the character of keeping a better article than any of his rivals in the same trade. He had obtained possession, too, we are told, of the secret method of dyeing hair, by which he doubtless contrived to augment his profits; and perhaps, in his accidental acquaintance with this little piece of chemistry, we may find the germ of that sensibility he soon began to manifest to the value of new and unpublished inventions in the arts, and of his passion for patent-rights and the pleasures of monopoly.

It would appear that his first effort in mechanics, as has happened in the case of many other ingenious men, was an attempt to discover the perpetual motion. It was in inquiring after a person to make him some wheels for a project of this kind, that in the latter part of the year 1767 he got acquainted with a clockmaker of the name of Kay, then residing at Warrington, with whom it is certain that he remained for a considerable time after closely connected. From this moment we may date his entrance upon a new career.

The manufacture of cotton cloths was introduced into this country only towards the end of the seventeenth century; although stuffs, improperly called Manchester cottons, had been fabricated nearly three centuries before, which, however, were made entirely of wool. It is generally thought that the first attempt at the manufacture of cotton goods in Europe did not take place till the end of the fifteenth century, when the art was introduced into Italy. Before this, the only cottons known had been imported from the East Indies.

The English cottons, for many years after the introduction of the manufacture, had only the web of cotton, the warp, or longitudinal threads of the cloth, being of linen. It was conceived to be impracticable to spin the cotton with a sufficient hard twist to make it serviceable for this latter purpose. Although occasionally exported too in small quantities, the manufactured goods were chiefly consumed at home. It was not till about the year 1760 that any considerable demand for them arose abroad.

But about this time the exportation of cottons, both to the Continent and to America, began to be carried on on a larger scale, and the manufacture of course received a corresponding impulse. The thread had hitherto been spun entirely, as it still continues to be in India, by the tedious process of the distaff and spindle, the spinner drawing out only a single thread at a time. But as the demand for the manufactured article continued to increase, a greater and greater scarcity of weft was experienced, till, at last, although there were 50,000 spindles constantly at work in Lancashire alone, each occupying an individual spinner, they were found quite insufficient to supply the quantity of thread required. The weavers generally, in those days, had the weft they used spun for them by the females of their family; and now "those weavers," says Mr Guest, in his *History of the Cotton Manufacture*, "whose families could not furnish the necessary supply of weft, had their spinning done by their neighbours, and were obliged to pay more for the spinning than the price allowed by their masters; and, even with this disadvantage, very few could procure weft enough to keep themselves constantly employed. It was no uncommon thing for a weaver to walk three or four miles in a morning, and call on five or six spinners, before he could collect weft to serve him for the remainder of the day; and when he wished to weave a piece in a shorter time than usual, a new ribbon or gown was necessary to quicken the exertions of the spinner."

It was natural, in this state of things, that attempts should be made to contrive some method of spinning more effective than that which had hitherto been in use; and, in fact, several ingenious individuals seem to have turned their attention to the subject. Long before this time, indeed, spinning by machinery had been thought of by more than one speculator. A Mr Wyatt, of Litchfield, is stated to have actually invented an apparatus for that purpose so early as the year 1733, and to have had factories built and filled with his machines, both at Birmingham and Northampton. These undertakings, however, not being successful, the machines were allowed to perish, and no model or description of them was preserved. There was also a Mr Laurence Earnshaw, of Mottram, in Cheshire, of whom "it is recorded," says Mr Baines, in his *History of Lancashire*, "that, in the year 1753, he invented a machine to spin and reel cotton at one operation, which he showed to his neighbours, and then destroyed it, through the generous apprehension that he might deprive the poor of bread"—a mistake, but a benevolent one.

It was in the year 1767, as we have mentioned, that Arkwright became acquainted with Kay. In 1768, the two friends appeared together at Preston, and immediately began to occupy themselves busily in the erection of a machine for the spinning of cotton-thread, of which they had brought a model with them. They had prevailed upon a Mr Smalley, who is described to have been a liquor merchant and painter of that place, to join them in their speculation; and the room in which the machine was fixed was the parlour of the dwelling-house attached to the free grammar-school, the use of which Smalley had obtained from his friend, the schoolmaster. At this time Arkwright was so poor that, an election contest having taken place in the town, of which he was a Burgess, it is asserted that his friends, or party, were obliged to subscribe to get him a decent suit of clothes before they could bring him into the poll-room. As soon as the election was over, he and Kay left Preston, and carrying with them their model, betook themselves to Nottingham, the apprehension of the hostility of the people of Lancashire to the attempt he was making to introduce spinning by machinery having, as Arkwright himself afterwards stated, induced him to take this step. On arriving at Nottingham, he first made arrangements with Messrs Wrights, the bankers, for obtaining the necessary supply of capital; but they, after a short time, having declined to continue their advances, he took his model to Messrs Need and Strutt, stocking-weavers of the place, the latter of whom was a particularly ingenious man, and well qualified, from his scientific acquirements, of which he had possessed himself under many disadvantages, to judge of the adaptation of the new machinery to its proposed object. An inspection of it perfectly satisfied him of its great value; and he and Mr Need immediately agreed to enter into partnership with Arkwright, who accordingly, in 1769, took out a patent for the machine as its inventor. A spinning-mill, driven by horse-power, was at the same time erect-

ed, and filled with the frames; being, unless we include those erected many years before by Mr Wyatt, the first work of the kind that had been known in this country. In 1771 Arkwright and his partners established another mill at Cromford, in the parish of Wirksworth, in Derbyshire, the machinery in which was set in motion by a water-wheel; and in 1775 he took out a second patent, including some additions which he had made to his original apparatus.

In what we have hitherto related, we have carefully confined ourselves to facts which are universally acknowledged; but there are other points of the story that have been stated in very opposite ways, and have given rise to much doubt and dispute.

The machinery for which Arkwright took out his patents consisted of various parts, his second specification enumerating no fewer than ten different contrivances; but of these the one that was by far of greatest importance, was a device for drawing out the cotton from a coarse to a finer and harder twisted thread, and so rendering it fit to be used for warp as well as weft. This was most ingeniously managed by the application of a principle which had not yet been introduced in any other mechanical operation. The cotton was in the first place drawn off from the skewers, on which it was fixed by one pair of rollers, which were made to move at a comparatively slow rate, and which formed it into threads of the first and coarser quality; but at a little distance behind the first was placed a second pair of rollers, revolving three, four, or five times as fast, which took it up when it had passed through the others, the effect of which would be to reduce the thread to a degree of fineness so many times greater than that which it originally had. The first pair of rollers might be regarded as the feeders of the second, which could receive no more than the others sent to them; and that, again, could be no more than these others themselves took up from the skewers. As the second pair of rollers, therefore, revolved, we will say, five times for every one revolution of the first pair, or, which is the same thing, required for their consumption in a given time five times the length of thread that the first did, they could obviously only obtain so much length by drawing out the common portion of cotton into thread of five times the original fineness. Nothing could be more beautiful or more effective than this contrivance, which, with an additional provision for giving the proper twist to the thread, constitutes what is called the water-frame or throstle.

Of this part of his machinery, Arkwright particularly claimed the invention as his own. He admitted, with regard to some of the other machines included in his patent, that he was rather their improver than their inventor; and the original spinning-machine for coarse thread, commonly called the spinning-jenny, he frankly attributed in its first conception to a person of the name of Hargrave, who resided at Blackburn, and who, he said, having been driven out of Lancashire in consequence of his invention, had taken refuge in Nottingham; but, unable to bear up against a conspiracy formed to ruin him, had been at last obliged to relinquish the farther prosecution of his object, and died in obscurity and distress.

There were, however, other parties who had an interest as well as Arkwright in these new machines, and who would not allow that any of them were of his invention. As to the principal of them, the water-frame, they alleged that it was in reality the invention of a poor reed-maker, of the name of Highs, or Hayes, and that Arkwright had obtained the knowledge of it from his old associate Kay, who had been employed by Highs to assist him in constructing a model of it a short time before Arkwright had sought his acquaintance. Many cotton-spinners, professing to believe this to be the true state of the case, actually used Arkwright's machinery in their factories, notwithstanding the patent by which he had attempted to protect it; and this invasion of his monopoly was carried to such an extent, that at last he found himself obliged to bring actions against no fewer than nine different parties.

It would be needless to enter here into the history of Arkwright's legal contests, which, after various success, he finally lost. Whatever conclusion may be come to on the subject of his claim to the invention of the machinery introduced by him into his spinning factories, it is incontestable that to him alone belongs the merit both of having combined its different parts with admirable ingenuity and judgment, and of having, by his unwearied and invincible perseverance, first brought it into actual use on anything like an extensive scale, and demonstrated its power and value. The several inventions which his patent embraced, whether they were his own or not, would probably but for him have perished with their authors; none of whom except himself had the determination and courage to face the multiplied fatigues and dangers that lay in the way of achieving a practical exemplification of what they had conceived in their minds, or to encounter any part of that opposition, incredulity, ridicule, of those disappointments, repulses, losses, and other discouragements, over all of which he at last so completely triumphed. When he set out on this career he was poor, friendless, and utterly unknown. We have already stated that, on his coming with Kay to Preston, he was almost in rags; and it may be added, that when he and Kay made application immediately before this to a Mr Atherton for some pecuniary assistance to enable them to prosecute their plans, Arkwright's appearance alone was enough to determine that gentleman to have nothing to do with the adventure. Can we have a more exciting example, then, of what a resolute heart may do in apparently the most hopeless circumstances?—of what ingenuity and perseverance together may overcome in the pursuit of what they are determined to attain? And this is the grand lesson which the history of Arkwright is fitted to teach us—to give ourselves wholly to one object, and never to despair of reaching it. Even after he had succeeded in

forming his partnership with Messrs Need and Strutt, his success was far from being secured. For a long time the speculation was a hazardous and unprofitable one; and no little outlay of capital was required to carry it on. He tells us himself in his case that it did not begin to pay till it had been persevered in for five years, and had swallowed up a capital of more than twelve thousand pounds. We cannot doubt that it required all Arkwright's dexterity and firmness to induce his partners to persevere with the experiment under this large expenditure and protracted disappointment. But it was the character of the man to devote his whole heart and faculties to whatever he engaged in. Even to the close of his life, the management of his different factories was his only occupation, and even amusement. Although he had been from early life afflicted with severe asthma, he took scarcely any recreation—employing all his time either in superintending the daily concerns of these establishments—which were regulated upon a plan that itself indicated in its contrivance no little ingenuity and reach of mind—or in adding such improvements to his machinery, from time to time, as his experience and observation suggested. And thus it was, that from a poor barber he raised himself to what he eventually became—not merely to rank and great affluence, but to be the founder of a new branch of national industry, destined in a wonderfully short space of time to assume the very first place among the manufactures of his country."

THE GREAT UNIVERSAL PLAGUE.

The different plagues which had visited Great Britain within the last five hundred years, were summarily adverted to in the first number of the *Journal*, particularly that in London in the year 1665. It was there stated that one of the greatest of these pestilences occurred in the reign of Edward III.; and as this was perhaps the most dreadful and most universal plague which is related in modern history, it is worth while to present a more lengthened description of its character and duration. For this purpose I take the liberty of abridging an excellent account of this great plague from a recent number of *Fraser's Magazine*.

"This dreadful pestilence, like the cholera, made its first appearance in the east. It arose in China, Tartary, India, and Egypt, about the year 1345. It is ascribed by contemporary writers to a general corruption of the atmosphere, accompanied by the appearance of millions of small serpents and other venomous insects, and in other places, quantities of huge vermin, with numerous legs, and of a hideous aspect, which filled the air with putrid exhalations. Making every allowance for the ignorance and credulity of the age, it appears evident that some natural causes had contributed to corrupt the air, and load it with pestiferous vapours. Thus it came into England in the end of the year 1369; and it rained from the previous Christmas till midsummer, almost without ceasing. Great inundations followed, and accumulations of stagnant water, by which the whole atmosphere was poisoned. It appears that in many countries there were also earthquakes and tremblings of the earth. In many of the accounts given of these convulsions of nature, we may presume there was a good deal of exaggeration. But the testimonies are too numerous and respectable to leave any doubt that, before and during the pestilence, the elements were in a state of general convulsion which seems unparalleled in history.

The plague extended its ravages from Abyssinia to the more western parts of Asia, into Egypt, India, and thence into the northern parts of Africa. It proceeded over Asia Minor, Greece, and the islands in the Archipelago, almost depopulating the regions over which it stalked. It may be literally said to have decimated the world, even though we were to take this term as implying the destruction of *nine* in place of *one*, out of ten. The plague appears to have staid five or six months in one place, and then to have gone in search of fresh victims. Its symptoms are minutely described by many writers, and appear to have been the same in every country it visited. It generally appeared in the groin, or under the armpits, where swellings were produced, which broke out into sores, attended with fever, spitting and vomiting of blood. The patient frequently died in half a day—generally within a day or two at the most. If he survived the third day, there was hope, though even then many fell into a deep sleep from which they never awoke.

From Greece the plague passed into Italy. The Venetians having lost 100,000 souls, fled from their city, and left it almost uninhabited. At Florence, 60,000 persons died in one year. France next became exposed to its ravages, and the mortality was horrible. The malady proceeded northward through France, till it reached Paris, where it cut off 50,000 people. About the same time it spread into Germany, where its ravages are estimated at the enormous amount of 12,400,000 souls.

At last this fearful scourge began to be felt in England. About the beginning of August 1348 it appeared in the seaport towns on the coasts of Dorset, Devon, and Somersetshire, whence it proceeded to Bristol. The people of Gloucestershire immediately interdicted all intercourse with Bristol, but in vain. The disease ran, or rather flew, over Gloucestershire. Thence it spread to Oxford, and about the 1st of November reached London. Finally, it spread over all England, scattering everywhere such destruction, that, out of the whole population, hardly one person in ten was left alive. Incredible as this statement may appear, it seems borne out by the details of contemporary annals. In the churchyard of Yarmouth, 7052 persons who died of the plague were buried in one year. In the city of Norwich, 67,374 persons died in six months. In the city of York, the mortality was equal. In London, the dead were thrown into pits—forty, fifty, or sixty, into one; and large fields were employed as burial places, the churchyards being insufficient for the purpose. No attempt was made to perform this last

office with the usual care and decency. Deep and broad ditches were made, in which the dead bodies were laid in rows, covered with earth, and surmounted with another layer of bodies, which were also covered. The mortality fell chiefly upon the lower classes of society, and, among them, principally on old men, women, and children. [In these respects, this plague seems to have differed from some of the plagues in the seventeenth century, which fell particularly upon the upper classes.—See Journal, No. 1.] It was remarked, that not one king or prince of any nation died of the plague, and of the English nobility and people of distinction very few were cut off. Among the higher orders of the church, the deaths were rare. It appears that no precautions could prevent the influence of the contagion. The bonds of society were loosed; parents forsook children, and children parents; some fled to the country, others locked themselves up in their houses, and many went on board vessels. But everywhere the fugitives were followed, for the destroying angel had a foot on the waters as well as on the land. "The pestilence spread into Wales and into Ireland. As to the Scots, they are said to have brought the malady upon themselves. Taking advantage of the defenceless state of England [or rather resolved to avenge the injuries they had suffered under the Edwards], they made a hostile irruption with a large force into the country. But they had not proceeded far, when the plague overtook them. They perished in thousands, and carried the disease with them into Scotland, where its ravages were soon as destructive as they were in England. Early in the year 1349, the plague began to abate; and by the month of August it had entirely disappeared. Its consequences, however, continued for some time to be severely felt. During the prevalence of the disease, the cattle, for want of men to tend them, were allowed to wander about the fields at random, and perished in such numbers as to occasion a great scarcity. Though the fields, too, were covered with a plentiful crop of corn, much of it was lost for want of hands to reap and gather it in. The last drags of this great plague were drained by that unfortunate race, the Jews. A belief spread over several countries that they had produced the pestilence by poisoning the wells and fountains; and in many places they were massacred in thousands by the infuriated populace. In several parts of Germany, where this persecution chiefly raged, the Jews were literally exterminated. Twelve thousand of them were murdered in the single city of Mentz; and multitudes of them, in the extremity of their despair, shut themselves up in their houses, and consumed themselves with fire. The extent of such atrocities, in a barbarous age, may well be imagined, when we remember the outrages which were at first produced in some parts of the Continent by the cholera panic."

ON HOME.

BY JOSIAH CONDER.

That is not home, where day by day
I wear the busy hour away;
That is not home, where lonely night
Prepares me for the toils of light—
'Tis hope, and joy, and memory, give
A home in which the heart can live—
These walls no lingering hopes endear,
No fond remembrance chains me here;
Cheerless I leave the lonely sigh—
Eliza, canst thou tell me why?
'Tis where thou art is home to me,
And home without thee cannot be.

There are who strangely love to roam,
And find in wildest haunts their home;
And some in halls of lordly state,
Who yet are homeless, desolate.
The sailor's home is on the main,
The warrior's on the tented plain,
The maiden's, in her bower of rest,
The infant's on his mother's breast—
But where thou art, is home to me,
And home without thee cannot be.

There is no home in halls of pride,
They are too high, and cold, and wide.
No home is by the wanderer found:
'Tis not in place: it hath no bound:
It is a circling atmosphere,
Investing all the heart holds dear;—
A law of strange attractive force,
That holds the feelings in their course.

It is a presence undefin'd,
O'ershadowing the conscious mind,
Where love and duty sweetly blend
To consecrate the name of friend;—
Where'er thou art, is home to me,
And home without thee cannot be.

My love, forgive the anxious sigh—
I hear the moments rushing by,
And think that life is fleeting fast,
That youth with health will soon be past.
Oh! when will time consenting give
The home in which my heart can live?
There shall the past and future meet,
And o'er our couch, in union sweet,
Extend their cherub wings, and shower
Bright influence on the present hour.
Oh! when shall Israel's mystic guide,
The pillar'd cloud, our steps decide,
Then, resting, spread its guardian shade,
To bless the home which love hath made?
Daily, my love, shall thence arise
Our hearts' united sacrifice;
And home indeed a home will be,
Thus consecrate and shared with thee.

Scottish Anecdotes.

LORD MELVILLE.

Ere the late Lord Melville had obtained the patronage of Scotland, he was by no means popular in that country. On the contrary, he was, oftener than once, in danger of his life from mobs in Edinburgh. Paying a visit to the capital on one occasion, after having been concerned in some odious public measure, he sent for a barber, in the morning, to shave him at his hotel. The tonsor, who happened to be a wag, on entering the room, saluted Mr Dundas, and welcomed him to Edinburgh. Then having decorated him with an apron, he began to lather his face; during which operation, he cast upon him sundry scowling and penetrating glances, the meaning of which the stranger could not well comprehend. At length, flourishing his razor, he said in a sharp and stern voice, "We are much obliged to you, Mr Dundas, for the part you lately took in London."—"What!" replied the secretary, "you are a politician, I find? I sent for a barber."—"Oh, yes," returned the knight of the pewter basin, "I'll shave you directly;" which he did, until one half of the beard was cleanly mowed; when, coming to his throat, he drew the back of the razor across it, saying, "Take that, ye traitor!" and off he ran, down stairs, into the street. Whether Mr Dundas felt any uneasiness at the barber's manner, we know not; but the latter expression—the action being so well suited to the word—induced him instantly to apply the apron to his throat, and to make a loud gurgling noise, which being heard by some of the people of the house, they immediately ran to his assistance. They soon discovered, by the pantomimic gestures of Mr Dundas, what had occurred, and it was not long before the room was full of members of the faculty, of all degrees—apothecaries, surgeons, and physicians! It was a considerable time before the patient could be prevailed on to remove the apron, and expose his throat; but at length, when he did so, with much caution, it was found to be in a perfectly whole state, there not being even a scar visible! Though Mr Dundas had much reason to be delighted at having escaped unhurt, he was not a little mortified at the laugh which this adventure occasioned; and his chagrin was greatly increased when he found that he had to pay for the attendance of the medical gentlemen; which having done, and having shaved the other side of his face himself—for he would trust no more barbers—he decamped from Edinburgh, and did not return for many years.

WILKES.

At the period of Wilkes's popularity, every wall bore his name, and every window his portrait. In china, in bronze, or in marble, he stood upon the chimney-pieces of half the houses of the metropolis; he swung upon the sign-post of every village, of every great road throughout the country. He used himself to tell, with much glee, of a monarchical old lady, behind whom he accidentally walked, looking up, and murmuring within his hearing, in much spleen, "He swings every where but where he ought!" Wilkes passed her, and, turning round, politely bowed.

GARRICK.

On one occasion, Garrick dined in the beef-steak room at Covent Garden, ready dressed in character for the part of Ranger, which he was to perform the same night at the other theatre. Ranger appears in the opening of the comedy; and as the curtain was not drawn up at the usual time, the audience began to manifest considerable impatience, for Garrick had not yet arrived. A call-boy was instantly dispatched for him, but he was unfortunately retarded by a line of carriages that blocked up the whole of Russell Street, which it was necessary for him to cross. This protracted still farther the commencement of the piece; and the house evinced considerable dissatisfaction, with cries of "Manager, manager!" When Garrick at length reached the green-room, he found Dr Ford, one of the patentees, pacing backwards and forwards in great agitation. The moment the doctor saw him, he addressed him in a strong tone of rebuke. "I think, David, considering the stake you and I have in this theatre, you might pay more attention to its business."—"True, my good friend," returned Garrick, "I should have been in good time; but I was thinking of my *steak* in the other." The appearance of their favourite soon pacified the audience, and Garrick went through the character with more vivacity than ever.

POLITICAL BON MOT.

Some one jealously observed to the Marquis Wellesley, that in his arrangements of the Ministry, "His brother the Duke had thrown him overboard."—"Yes," said the Marquis, "but I trust I have strength enough left to swim to the other side."

THE PRETENDER'S HEALTH.

There was not much wit, but there was some good humour in the reply George II. made to a lady, who, at the first masquerade his Majesty was at in England, invited him to drink a glass of wine at one of the *beaufêtes*: With this he readily complied, and the lady filling a bumper, said, "Here, mask the Pretender's health;" then filling another glass, presented it to the king, who, receiving it with a smile, replied, "I drink with all my heart to the health of all unfortunate princes."

MESS-ROOM GOSSIP.

The late Duke of York once remarked to Colonel W. at the mess of the 11th regiment, that the colonel was uncommonly bald, and, although a younger man than his royal highness, he stood more in need of a wig. The colonel, who had been of very long standing in the service, and whose promotion had been by no means rapid, informed his royal highness, that his baldness could be very easily accounted for. "In what manner?" asked his royal highness, rather eagerly. To which Colonel W. replied, "By junior officers stepping over my head." The Duke was so pleased with the reply that the gallant colonel obtained promotion in a few days afterwards.

THE FAMILY OF ELIBANK.

Every body is familiar with the mode of life practised some two or three hundred years ago on the Scottish borders. When a housewife ran out of butcher-meat, she either presented a pair of spurs under cover at dinner, as a hint that her sons and husband should ride out to obtain a supply, or, if inclined to be a little more provident, informed them, in the afternoon, that the "hough was in the pot," thereby insinuating that her beef-barrel was reduced to its last and worst fragment. It is told that Scott of Harden, the ancestor of a very respectable family which still flourishes on the border, was one day coming home with a large drove of cattle, which he had lifted, as the phrase went, in some of the dales of Cumberland, when he happened to espy a large haystack in a farm-yard by the way-side, which appeared to him as if it could have foddered his prey for half the winter. Vexed to think that this could not also be lifted, the chieftain looked at it very earnestly, and said, with bitter and emphatic expression, "By my saul, if ye had four feet, ye should gang too." A member of this family was what might have then been called *unfortunate* in one of his enterprises. Having invaded the territories of Sir Gideon Murray of Elibank, ancestor of the noble family of that name and title, he was inveigled by the latter into an ambuscade, and taken, as it were, in the very fact. Murray, being an officer of state, thought himself bound to make an example of the offender, and he accordingly gave orders to the unfortunate Harden to prepare for immediate execution. Elated with his victory, he went home and communicated his intention to his lady. "Are you mad?" said her ladyship; "would you hang the young laird of Harden, you that has sae many unmarried daughters? Na, na, it'll be a handle mair wisely to mak the young laird marry ane o' them." The eloquence of the lady prevailed; and, as young Harden was in perilous circumstances, and was expected gladly to accept of any alternative to avoid an ignominious death, it was resolved that he should wed "Muckle-Mou'd Meg," the third daughter of the family, who was distinguished by what, in modern phraseology, is termed an "open countenance;" that is, in less metaphorical language, her mouth extended from ear to ear. The alternative was accordingly proposed to the culprit, but, to the astonishment of all concerned, it was at once rejected. "Weel, weel, young man," says the laird of Elibank, "ye's get 'till the morn's mornin' to think about it," and so saying, he left the young laird in his dungeon to his own agreeable reflections. In the morning, Harden, after a sleepless night, looked out from the window, or rather hole of his cell, and saw the gallows erected in the yard, and all the apparatus of death prepared. His heart failed him, and he began to think that life, even though spent in the society of "Muckle-Mou'd Meg," was not a thing to be rashly thrown away. He declared his willingness, therefore, to accept of the maiden's hand. There were no marriage laws in those days—no proclamation of banns—no session-clerk's fees. The priest was sent for, and the indissoluble knot was tied. Nor did Harden ever repent of his bargain; for Meg, notwithstanding the deformity from which she took her name, was in fact one of the best creatures in existence, possessed of a great fund of excellent sense, and withal a handsome *personable* woman. She turned out an admirable wife, managed the household of Harden with the utmost propriety; and a union which had taken place under such extraordinary circumstances, and with such very unpromising auspices, was in the highest degree cordial and constant.—*Chambers's Scottish Jests and Anecdotes.*

LIVING ABROAD.

I will endeavour to enable any one to judge how far it may be worth his while to come to reside in France from motives of economy. The French are sometimes puzzled to make out why the English come abroad; perhaps the English, if they were asked, would be equally puzzled themselves. The price of almost every article, the produce of agricultural or manufacturing industry, has been increased one-third, some say two-fifths, in France, since the beginning of the revolution; the taxes have been trebled. The result of between three and four years' experience is, that about one-sixth is saved by living, not in Paris, but in a provincial town in France, or, that a franc (10d.) will go as far as a shilling. Set against the saving the expense of the journey, and the saving will not be great to those who do not retrench in their mode of life. House-rent is higher in France than in England; fuel much dearer; some manufactured articles, as woollen cloth for coats, and linen and cotton for shirts, are equally dear; tea is cheaper, as the Americans supply it, or England with a remission of duty. But there are no assessed taxes, no poor-rates; provisions I found to be cheaper by about one-third, and instead of small beer, my children now drink wine.—*Four Years in France.*

Column of Serious Reading.

IMPROVEMENT OF MANKIND BY CHRISTIANITY.

IN the eleventh number of the Journal, I took the liberty of offering to my juvenile readers a concise comparative view of the philosophies of the ancients, and the religion of Christ; in which, in the spirit of impartiality, I showed the marked superiority of the latter, simply as regarded its moral efficacy. Since writing that paper, I have fallen in with an exceedingly pleasing and edifying production, in a small compass, entitled, "*Reasons for the Hope that is in us*," by Robert Ainslie—a gentleman whose name is associated with reminiscences of the literary circles of the Scottish metropolis towards the end of last century, and the author of a similar previous work, designated "*A Father's Gift to his Children*." It is the characteristic of this author to exhibit Christianity under its most alluring, and what I would humbly imagine to be, its most correct form. While he instructs by the extent and familiarity of his details, as well as by the clear simplicity of his style, he invites our sympathy by depicting religion in such an attractive garb that he cannot fail in fixing the attention of the wavering, and securing the respect even of the avowed sceptic. It is not my present purpose to offer an analysis of the evidences of natural and revealed religion here so plainly laid down, or enlarge on the various other topics introduced; as I trust that families will lose no time in procuring the volume for a patient perusal, seeing that it is particularly adapted to the young: it is more my design to follow up my former comparative view, by presenting an extract from one of the most interesting chapters, illustrative of the *Improvement effected on mankind through the permanent establishment of Christianity*.

"In taking a view of the morality and feelings of ancient and modern times (says the author), a material difference between them generally presents itself, and we perceive a great superiority of the latter over the former. Instead of the barbarity of the old world, we now find wars carried on with less ferocity; humanity towards the vanquished when the conflict has ceased; domestic slavery abolished or mitigated; suicide abated; the desperate evil of human sacrifices over; protection given to the helpless; institutions abounding for the sick and destitute; revenge forbidden and discountenanced; and philanthropy considered as the greatest virtue. True religion has of all things the most steady and lasting influence on the human mind; and we will find no difficulty in discovering in it the causes of such changes in sentiment and conduct. This we shall do on contrasting the beneficent system introduced by the Saviour, with those which prevailed under the heathen superstitions, and their grossness, their cruelties, and their fostering the worst of human passions.

As the world came to be Christianised, the humane and benevolent doctrines of the Scriptures became, in sundry different countries, the foundation of, or engrafted with, their municipal laws. Thus many parts of those of Theodosius and Justinian were taken from the Gospels. Those of the Visigoths, Burgundians, Franks, and other rude races of men, were amended by the fine spirit which portions of the word of God had infused into them. Alfred the Great transcribed into his civil institutions the ten commandments, and several chapters of the Book of Exodus; and many of the laws of Charlemagne and Louis were taken from the books of Moses. It was impossible that nations should not receive general culture and civilisation from such excellent sources. That they did so, I shall now proceed to show.

The horrors of war have been extremely mitigated through the prevalence of Christianity, and the injunctions of the pious and the good. Thus Constantine, the first of the Christian Roman Emperors, expressly enjoined his soldiers that mercy should be made by them to follow victory; and finding, in some instances, his orders little attended to, he himself ransomed his own prisoners even from his own troops. When Attila, the barbarous King of the Huns, who was styled the "*Scourge of God*," had laid waste Italy, and resolved to march straightway to Rome, where the greatest devastation would have ensued, he was turned aside from his fatal purpose by the admonition of a pious Archbishop; and even the terrible Alaric, the Goth, when he had stormed the Imperial City, respected the churches, and saved those who fled there for refuge; exhorting his soldiers, in the midst of their conquest, to spare unresisting citizens who had so sheltered themselves. The middle ages of Europe were extremely improved by *chivalry*, where gallant knights fought for the Cross of Christ, and the safety of the destitute. Although the romance of that noble institution is now long over, yet modern times still feel its benign influence, and are bettered by the humane and gentle manners and sentiments which were imperceptibly introduced by it; and these have shown themselves in many an interesting instance. Now, no such things are to be found in the histories of the ancients; but probably the finest instance of all, of the striking difference between them and the moderns, and of the merciful feeling in the heart of the brave, is found in the prayer of Nelson, composed by him immediately before his entering into the battle of Trafalgar; and which ought to be engraven in letters of gold, for the sake of all future ge-

nerations. It was in the following terms:—"May the great God, whom I worship, grant to my country, and for the benefit of Europe in general, a great and glorious victory; may no misconduct in any one tarnish it; and may humanity after victory be the predominant feature in the British fleet." Such in modern times have been the sentiments and the conduct of the gallant and the good towards their fallen foes. And let this be compared with the ferocity of the ancient heathens. The victorious legions of Rome, when they were directed by Scipio, at the sack of Carthage, to put to death all without distinction, were told by him "that such was the custom of Rome." Julius Cæsar, besides all his slaughter in the field, and in subduing of nations, stormed a thousand cities with the usual ferocity, and reduced a million of people to abject slavery. But where, in an especial manner, is the source of such wonderful difference? It is found in the admonition of the Son of God, "*Love your enemies, and be merciful, as your Father in Heaven is merciful*."

Infanticide, or the slaughter of young children, to replace too numerous a population, was not only sanctioned by the customs of the ancient world, but was recommended by its sages, and even enacted by its legislators. Thus Plato and Aristotle both enjoined the practice, and Lycurgus made it a part of the law of Sparta. In the Roman world, during the reign of Caligula, it was common; and so general must it have been among the nations connected with it, that Tacitus, in treating of the Germans, mentions it as a remarkable circumstance that the custom was not found with them. The same dreadful expedient to restrain what is considered an inconvenient increase of mankind, has been adopted also, to a great extent, in more modern times, where Christianity has not prevailed. Such systematic murder of helpless children has given way gradually before the increasing light of the Gospel.

Human sacrifices were extremely prevalent in the ancient world. Of old it was a rule with every Grecian state before their armies were marched against an enemy, to immolate human victims; and it is well known that the Athenians had a custom of sacrificing a man every year, after loading him with dreadful curses, that the wrath of the gods might fall upon his head, and be turned away from the rest of the citizens. Such sacrifices prevailed also at an early period among the Romans. In the time of Porphyry, a man was every year sacrificed at the shrine of Jupiter Latiaris. All barbarous nations have followed this practice. The annual sacrifices of the Mexicans required some thousands of human victims; and in Peru two hundred children were devoted to the health of the Inca, and sacrificed. But these, and all other immolations, ceased in the light of the Gospel, and before that One Great Sacrifice offered for the sins of all mankind.

Suicide was not only extremely prevalent in the old world, but was countenanced by the philosophy of the times. Gladiator fighting was also very common in the old world. Very little attention was likewise paid to strangers, but the use and promulgation of these blessed words, "*I was a stranger and ye took me in*," gave rise in after ages to many pious institutions for their protection and relief. In the same manner the state of all descriptions of prisoners was deplorable of old. Whipping and putting to death of debtors were permitted by the early laws of Rome. The first being who seems to have felt for the fate of those in prison was Christ, and the words which he uttered "*I was in prison and ye visited me*," laid the foundation of merciful laws in every Christian country for diminishing the captive's misery, and cheering the gloom of his melancholy dwelling.

The protection of widows and orphans, and the healing of the sick and wounded, also attracted the attention of the early Christians, and produced in the more modern world what the ancients altogether wanted, viz. charitable institutions of all kinds for these humane purposes. Christianity has reformed the general conduct of men. But not only has it reformed their morals—it has been the means of also enlightening and instructing them. Suffice it to notice, that when the world was overrun with barbarism on the fall of the Roman empire, learning found a safe asylum in the Christian sanctuaries, from which it afterwards came forth to bless mankind; that connected with it have arisen noble institutions for the instruction of the rich and the middle ranks of Europe, while the constant perusal of the Scriptures, which now takes place in the most of its countries, and the hearing of their exposition, lay open to all a truer theology, a purer morality, and more just views of human nature, than what the greatest of the ancients ever knew. This necessarily brief enumeration of the essential benefits occurring to mankind from the beneficent influence of Christianity, may be wound up in the appropriate language of a recent American writer. "*The Christian religion*," says he, "*has been a rich blessing to every country which has embraced it; and its salutary effects have borne proportion to the care which has been taken to inculcate its general principles, and the cordiality with which its doctrines have been embraced. If we cast our eyes over the map of the world and inquire what nations are truly civilised? where does learning flourish? where are the principles of morality and the dictates of humanity best understood? where are the poor and afflicted most effectually relieved? where do men enjoy the greatest security of life, property, and liberty? where is the female sex treated with due respect, and exalted to its proper place in society? where is the education of youth most assiduously pursued? where are the brightest examples of benevolence? and where do men enjoy most rational happiness? I say, if we were called upon to designate those countries in which these advantages are most highly enjoyed, every one of them would be found in Christianity; and the superiority enjoyed by some over the others would be found to bear an exact proportion to the practical influence of pure Christianity.*"

SPANISH AND PORTUGUESE ARMIES.

THE following succinct account of the amount of the Spanish and Portuguese regular armed forces, is given by Dr Browne in his valuable article *ARMY*, in the new edition of the *Encyclopædia Britannica*:—

"The Spanish army, which, under Charles V., Pescara, the Duke of Alba, and the Constable of Bourbon, had proved itself so formidable—extending the theatre of its exploits from the Pyrenees to the Po and the Adige on the one hand, and to the Elbe, the Meuse, and the Waal on the other—degenerated rapidly under the disastrous reigns of the last princes of the House of Austria. When Philip, V. ascended the throne at the beginning of the last century, it scarcely amounted to 15,000 men. By that prince and his successors, however, it was gradually increased, until, in the year 1792, its establishment amounted to 116,000 infantry, 12,200 cavalry, with upwards of 10,000 artillery, and its effective force to about 120,000 men of all arms. At present its effective amounts to 90,000 men, and its disposable force to 75,000 combatants. It is composed of the general active staff, of the staff of the fortresses, of the household troops and royal guard, of the infantry and cavalry of the line, with artillery, engineers, and veterans. Its staff consists of 6 captain-generals, 77 lieutenant-generals, 122 major-generals, 350 brigadier-generals, with inferior officers in proportion. There are 15 captives, viz. 12 territorial and 3 colonial. In Spain, and its possessions contiguous to the Peninsula, there are 150 fortresses, posts, forts, citadels, or open towns where troops are in garrison. The household troops consist of six squadrons of the body guard and a company of halberdiers; of these, four squadrons are Spanish, and two foreign, called Saxons, in honour of the queen. The royal guard is organized like that of France, and consists of two divisions of infantry, one division of cavalry, and three companies of artillery, one of which is horse-artillery. The first division consists of four regiments of grenadiers, each composed of two battalions, divided into eight companies of 120 men each; and the second of two regiments of the elite of the provincial militia, divided into three battalions of four companies each. The cavalry forms a division of two brigades; and the artillery consists of three companies of 100 men each; serving a battery of six pieces mounted. The infantry of the line consists, first, of 10 regiments of three battalions each; secondly, of the Swiss regiment Wimpfen, one battalion only; thirdly, of a regiment, fixed at Ceuta, composed of four companies of 100 men each, the refuse of the army. Seven regiments, of two battalions each, of the same number and composition as those of the line, form the light infantry. The militia consists of 42 regiments of one battalion each, which is divided into eight companies. The cavalry consists of 13 regiments, of which 5 are of the line, and 8 light horse, each of four squadrons, composed like those of the royal guard; together with two companies of cuirassiers at Ceuta, one formed of native Spaniards, and the other of Moors. The royal corps of artillery is divided into the theoretical and practical. The troops of this arm consist, first, of 6 battalions of foot artillery, in garrison at Barcelona, Carthagena, Seville, Corunna, and Valladolid; secondly, of 4 companies of horse-artillery, in garrison at Carthagena and Seville; thirdly, of 5 companies of artificers; fourthly, of 6 battalions of the train; fifthly, of 3 brigades and 15 companies fixed in garrison, but exclusive of the personnel in America. This arm has a splendid museum at Madrid, besides a theoretical and practical school, directed by a brigadier-general or colonel, in the principal town or place of each province. The engineers are a corps of officers not regimented or brigaded, consisting of an engineer-general, 10 directors sub-inspectors, 17 colonels, 20 lieutenant-colonels, 34 captains, and 56 lieutenants; together with a regiment of sappers, consisting of 2 battalions of 3 companies each, viz. 5 of sappers, 1 of miners, 1 of pontoneers, and 1 of workmen. The establishments of this arm are, a topographical depot-general, or collection of maps, plans, and military memoirs; a museum, containing representations in relief of the fortresses, and different models of fortifications; and an academy for the instruction of young officers intending to enter this branch of the service, after they have passed through the primary school of Segovia. All these establishments are situated in the capital.

The Spanish army is recruited by voluntary enrolment, and, in case of insufficiency, by ballot or conscription. The term of service is eight years for the first enrolment or ballot, and two or four for the second, when the soldier becomes entitled to an increase of pay. Before the war of independence no one could attain the rank of officer without having been a cadet; and each cadet was bound to prove his nobility. But since the return of Ferdinand these proofs have been dispensed with, and serjeants now obtain a third of the sub-lieutenancies; the other two-thirds being reserved for the *élèves* of the military school of Segovia, who have passed the customary examinations at the end of their course of study. The dress and equipment of the Spanish army are in the worst state; the pay of the troops is exceedingly irregular; and their discipline is, in consequence, as bad as it is possible to imagine, or rather, there is scarcely such a thing known.

After the general peace of 1814, when all the powers of Europe had reduced their military establishments, Portugal alone did not follow their example, but fixed the peace establishment of its permanent army at 49,268 infantry and 5290 cavalry; which, with the militia, made a force of 59,325 men, or about 22 soldiers for every 100 inhabitants. Such a state of things, however, was much too violent to be durable. Accordingly one of the first cares of the constitutional government of 1821 was to reform a military system so disproportionate to the population and the financial resources of the king.

dom. The armed force since that period has therefore consisted exclusively of the permanent army and the militia. The permanent army is composed of a general staff, an engineer corps, 24 infantry regiments of the line of 1 battalion each, 6 regiments of *chasseurs à pied*, and 12 regiments of *chasseurs à cheval* of 3 squadrons each, 4 regiments of artillery, a battalion of engineer artificers, a company of soldiers of the train, a police guard, and 30 companies of veterans. The general staff consists of an indeterminate number of lieutenant-generals, 16 major-generals, 24 brigadier-generals, 6 superior officers, 6 subalterns, 12 aids-de-camp, 12 secretaries, 10 employés, and a veterinary surgeon-in-chief; in all 100. The engineer corps (*corpo de engenheiros*) is composed of 4 colonels, 4 lieutenant-colonels, 8 majors, 12 captains, 12 lieutenants of the first class, 12 of the second; in all 64. Each regiment of infantry of the line and of light troops consists of 44 officers and 780 non-commissioned officers and soldiers. The effective strength of a regiment of artillery is 551 men, including 33 officers. The corps of the train of artillery (*artilheiros conductores*), reduced to a single company by the organization of 1821, is composed of 12 officers, 80 soldiers, and 70 mules (*bestas muaras*.) The battalion of engineer artificers consists of 201 men, including 12 officers. Each of the 30 companies of veterans is from 70 to 80 strong, including 2 officers. The police guard of Lisbon consists of a battalion of infantry of 8 companies and 980 men, including officers; together with a battalion of *gens d'armes à cheval* 230 strong, divided into 4 companies. The effective force of the permanent army on the peace establishment is therefore 29,645 foot, and 4411 horse. But the events of which Portugal has since 1821 been the theatre, and the circumstance of six battalions having been sent to Brazil, render it probable that, at the period of the insurrection of the Marquis de Chaves, the regular army did not exceed 24,000, or at most 25,000 men. The militia form 48 regiments of infantry, of the same strength and composition as those of the line; together with six separate corps, of which three are infantry, two cavalry, and one artillery: amounting in all to 38,542 men, and, with the army of the line, making the total of land forces, 68,187 men of all kinds and arms."

VALUE OF PROPERTY IN THE BRITISH EMPIRE.

THE Editor has already alluded to the vast accumulation of capital, or savings of labour, which annually takes place in Great Britain under any circumstances—whether of national prosperity or adversity—and which will, in all probability, ever act as a safeguard against great or irremediable misfortunes. The late Mr Colquhoun, in his work on the wealth of the British empire, estimated the amount of property which was thus annually created within the United Kingdom, its colonies, and dependencies, as follows. The period more particularly alluded to is 1812, since which time the amount of property in the empire has greatly increased.

GREAT BRITAIN AND IRELAND.

Agriculture,	L.216,817,624
Mines and minerals,	9,000,000
Manufactures,	114,230,000
Inland trade,	31,500,000
Foreign commerce and shipping,	46,373,748
Coasting trade,	2,000,000
Fisheries (exclusive of the colonial fisheries of Newfoundland),	2,100,000
Banks, viz. chartered banks, and private banking establishments,	3,500,000
Foreign income,	5,000,000
Dependencies in Europe,	1,818,000
	L.433,339,372

British possessions in North America,	L.13,215,474
British West India colonies,	28,712,466
	41,917,940
British settlements in Africa,	800,300
British colonies and dependencies in Asia,	6,194,230
Territorial possessions under the management of the East India Company,	211,966,494
	218,160,724
Total,	L.693,228,336

The same eminent statistic calculated the amount of property in the British empire, or the value of the United Kingdom and all its colonies and dependencies in Europe, America, Africa, and Asia, including the territorial possessions under the management of the East India Company, in 1812, as follows:—

EUROPE.—Great Britain and Ireland, including the navy	L.2,736,640,000
Dependencies	22,161,330
AMERICA.—British possessions in North America	46,575,360
British West India colonies	100,014,364
Conquered West India colonies	75,220,000
AFRICA.—British settlements	550,500
Conquered idem	4,220,100
ASIA.—British colonies and dependencies	11,280,000
Conquered idem idem	27,441,090
Territorial possessions under the management of the East India Company	1,072,427,751
Total property in the British Empire	L.4,096,530,895

(The above summary is extracted from *Bell's Population and Scientific Geography*.)

TEA DRINKING.

THERE is a certain class of people who take every opportunity of sneering at their neighbours for indulging in the "folly" of drinking tea, which they tell you is poisonous, and for the use of which the Chinese, as they say, make a point of laughing at us. I have generally remarked, that those who in this manner condemn the use of tea are themselves addicted to the drinking of intoxicating liquids of some kind or other, and that, in most instances, they are not a bit more healthful or more innocent than the unhappy tea drinkers whom they affect to pity. In the way that tea is usually made with a large mixture of sugar and cream, both which ingredients are highly nutritious, it is fully more salutary, and a great deal more refreshing, than any other light liquid that could be poured into the stomach. With all due deference to Cobbett, milk, even entirely divested of its creamy particles, is *heavy*, and though it may be used with advantage as a meal, when work is done in the open air, it can never suit the appetites of the great mass of the people, who are confined by sedentary employments. Milk is the food of men in a rude state, or in childhood; but tea or well-made coffee is their beverage in a state of civilisation. It would seem that the civilised human being must use a large quantity of liquid food. Perhaps solid meat is more nutritious; but there are cases in which a small degree of nutriment is quite sufficient. A lady or a gentleman of sedentary habits does not require to feed like a ploughman, or a fancy man training for a pedestrian excursion. They can subsist in a healthful state with a small quantity of solid food, but they do not do well unless with a large quantity of liquids, and these of a light quality. Good beer has been recommended as a substitute for tea; but beer is at the best a cold, ungenial drink, except to robust people who have much exercise. Beer may certainly be made almost as light as water itself, but in that case it is filled with gaseous matter or confined air, and it cannot be drunk with comfort as a simple refreshment.

It will always be remembered that there are different kinds of tea, and that some are more salutary than others. Green tea ought by all means to be avoided by persons of weak nerves. Black tea is the preferable for general use, and, if properly made, will prove antispasmodic, and relieve pains or cramps in the bowels. In some instances tea does not suit the particular state of the stomach, and it should then be abandoned, the taste naturally pointing out when it should be taken. But no species of prepared fluid seems so suitable to the palates and the stomachs of the people of this country. No kind of drink is so refreshing after a journey or fatigue as tea. It restores the drooping spirits, and invigorates the frame for renewed exertion. No other kind of liquid with which we are acquainted has the same remarkable influence morally and physically. Fermented or distilled liquors, taken under the same circumstances, either induce intoxication or sleep. It is preposterous to say that tea is poisonous. As there is an astringency in its properties, I believe it would be most injurious were we to live upon nothing else, or drink it as a tincture. But who does either? As it happens to be prepared and used, it answers merely as a refreshing and pleasing drink, either to the solid bread and butter taken along with it, or after a recent dinner of substantial viands. How idle it is to say that this harmless beverage is ruining the constitutions of the people of this country! The very reverse can be demonstrated. The inhabitants of Great Britain use nearly twenty-seven millions of pounds weight of tea annually, which is about the rate of 1 lb. 9 oz. on an average for every individual. From thirty to forty years ago they used a great deal less than the half of this quantity, yet the average length of human life has been greatly extended since that period. The English and Scotch now use more tea than all the rest of Europe put together, and yet they are the healthiest nation on the face of the earth. The North Americans are also great tea drinkers, and human life among them is of nearly an equal value. Who would for a moment compare the thin wretched wines of France and Germany, or the sour kroust of Russia, to the "comfortable" tea of Great Britain, and who would lose time in calculating the different effects of these liquids on the constitution?

Tea has other excellent properties. At this present moment it is putting down the pernicious practice of dram-drinking, and evidently limiting the extent of after-dinner potations. It seems to be impossible that a regular drinker of tea can be a lover of ardent spirits; and it is generally observed that as a man (or

woman either) slides into the vice of tippling, he simultaneously withdraws from the tea-table; so true it is that the brutalized feelings of the drunkard are incompatible with the refined sentiments produced by

"The cup which cheers, but not inebriates."

It is hence to be wished that tea, or some other equally simple prepared fluid, should be still more brought into use. Do not let it be urged as an objection that tea is expensive, for even under its excessive dearth, compared with its original cost, it is the cheapest beverage in use. With respect to price, it should not be placed against water or milk. It comes in place of some other indulgence—intoxicating liquors for instance—respecting the price of which we never heard any complaints from the lower walks of life. Tea is thus not entirely a superfluity. The clamours as to its fostering habits of evil and light speaking are so antiquated as hardly to deserve notice. Formerly, when tea was exclusively a luxury among women, the tea-table was perhaps the scene where scandal was chiefly discussed. But while I suspect that the same amount of scandal would have been discussed if there had been no tea-tables whatever, I must observe that teas no partaken of under greatly different circumstances. From being the favourite indulgence only of women, it is now an ordinary domestic meal, and there is no more disposition to draw forth the failings of our neighbours over tea than over roast beef or punch, at seven o'clock any more than at five. In the upper classes of society, what with late dinners, routs, and frivolities of every description, tea-drinking may be put aside as a vulgarism; but as being, in point of fact, a powerful agent in humanising the harsh feelings of our nature, and cultivating the domestic affections, I trust it will long hold a place in the dietetics of the respectable middle and lower classes of Great Britain.

THE COSSACK AND THE PANTHER.

Mogul Tartary (says Holman, the blind though enterprising traveller) is cold and rugged in the extreme, and often dangerous to the traveller, in consequence of the great number of wild animals that inhabit it. A singular rencontre took place some time since in the neighbourhood of the Chinese frontier between a Cossack and a panther, an animal which is exceedingly rare in this country. A young Cossack, inspecting one day a track in the woods, and observing the footprints of an animal which were strange to him, returned to communicate the circumstance to his father, who mounted his horse, with an axe in his hand, and, followed by his dog, went in search of him. He was soon discovered between some rocks, whence he retreated to another lair, but pursued by the Cossack. As the latter approached, the animal made a spring upon the horse, placing one foot on his fore part, and the other on his hind part, with his mouth between, widely open upon his pursuer, who, from the dreadful urgency of the case, thrust his left hand and arm down his throat, and, with his axe, at length destroyed him. The intrepid fellow's arm was, however, so much lacerated, that he has entirely lost the use of it. The animal, which proved to be a panther, was subsequently sent to St Petersburg, where it is now preserved in the museum; and his Imperial Majesty directed that the Cossack should be provided for, as a reward for his bravery, and a recompence for the injury sustained in this extraordinary combat.

It was announced in the Prospectus of the Journal, and subsequently notified, that no communications in verse or prose were wanted; and to save trouble to all parties, as well as a considerable expense, such a peculiarity in the conducting of this paper is again respectfully made known.—In reference to a communication on the subject, it has to be mentioned, that the articles on the British Colonies, &c. were written partly from accurate information furnished by the printed circulars of the Canada Company, from Parliamentary papers, and from the very valuable digest by J. R. Macculloch, entitled "*A Dictionary of Commerce and Commercial Navigation*,"—a work which cannot be sufficiently appreciated by the mercantile classes of Britain for the extent of its statements, and which the Editor of the Journal, who proposes speedily to offer an analysis of its details, has been in many instances considerably indebted to.

EDINBURGH: Published by WILLIAM and ROBERT CHAMBERS, Booksellers, No. 19, Waterloo Place. Sold also by JAMES CHAMBERS, 48, North Hanover Street, and by all other Booksellers in Edinburgh and every other Town in Scotland.

Subscribers in Town may have the Paper left at their houses every Saturday morning, by giving their addresses at 19, Waterloo Place. Price of a quarter of twelve weeks, 1s. 6d.; of a half year of twenty-four weeks, 3s.; and of a year, 6s. 6d. In every case payable in advance.

In LONDON, an Edition is published, with the permission of the Proprietors, by W. S. ORR, Paternoster-row, for circulation throughout England, Wales, and Ireland.

Stereotyped by ALEX. KIRKWOOD, North St Andrew Street, And printed by W. RITCHIE, & Co. Edinburgh.

CHAMBERS' EDINBURGH JOURNAL

CONDUCTED BY WILLIAM CHAMBERS, AUTHOR OF THE "BOOK OF SCOTLAND," "GAZETTEER OF SCOTLAND," &c.

No. 17.

SATURDAY, MAY 26, 1832.

PRICE THREE HALFPENCE.

FLITTING DAY.

OUR readers will perhaps recollect something of a former article in the Journal, in which we treated of the subject of removals—that is to say, the practice so general in Scotland (though otherwise in England) of shifting almost every year from one house to another, in a constant expectation of finding the *TO KALON*, as the Greeks call it, or, as we shall rather style it, the *QUITE THE THING* of house accommodation, which, however, is discovered at one year's end to be exactly as remote as it was a twelve-month before, and still, like general happiness, is "on before"—far looming over the horizon, like a vessel bound for some distant part of the globe, and not to be caught or overtaken, let us speed after it as we may. We have heard various individuals acknowledge that there were some good *home truths* in that article, though we rather believe the housewives in general were surprised at our blindness to the beauties of a good back-green. Let that be as it may, there was one thing in which that article was totally deficient—to wit, an account of the particular horrors of *removing day* itself, or, as we in Scotland call it, *flitting day*—a day styled in the calendar Whitsunday, and dedicated to we don't know what sacred use, but which, without regard to its sacred use, whatever that may be, we think men might wish that, above all others, it were fairly blotted out of the calendar—expunged from the very year itself—utterly annihilated and forgotten, because of the unhappy secular use to which it has been put from time immemorial. The 25th of May, or Whitsunday, old style, is indeed a day of peculiar agony amongst us. It is a day consecrated to the disruption of all local ties, to the rending of every kind of pleasant association, to the discomfiture of all the household gods. The very week in which it occurs is black with its atmosphere of pain.

It may be surprising to persons unacquainted with Scotland, that the people should be so fond of removing, since the day on which that event takes place is apt to be so very disagreeable. They might as well wonder that people should ever marry, when they know so very well that the charge of a family is apt to be burdensome. Candlemas day, on which people take their houses, is a day of heedless joy, a day of fond and delirious anticipation; and Whitsunday is to it what execution-day is to the particular time when an unfortunate man was tempted to enrich himself at some other body's expense. On Wednesday I killed my wife, on Saturday I was hanged, as the child's rhyme goes: no one can doubt that Wednesday was in this case a very pleasant day, whatever might be the state of the honest man's feelings at the end of the week. So it is with Candlemas and Whitsunday. On the former of these days we are actuated by a spirit of spite and dissatisfaction with our present abode; it is every thing that is disagreeable, and we must at all hazards get quit of it. Accordingly, the taking of another, and, as we think, better habitation, naturally appears as the opening of a haven of relief, and, of course, we have a great deal of either positive or negative pleasure in the day. Nor is this satisfaction confined to the day on which the new house is leased: it extends up to the very commencement of that week of suffering which involves Whitsunday—up to the first material disarrangement of furniture preparatory to removal. During the time which elapses between the leasing of the new habitation and our removal to it, we abandon all care for our present abode. Any thing that goes wrong about it must just remain so. If a lock were required for

the door, we would scarcely put ourselves to the trouble of getting it, but remain content with some provisional system of security, such as putting a table behind it. A large piece of plaster might fall down from the ceiling, or half of the floor of the dining-room sink into the kitchen—a whole gable or side wall, almost, might fall away, but we would never think of troubling ourselves with any attempt at repairs. It is a horrid house at any rate, and, for all the time we are to be in it, it does not matter. We'll soon be getting into our nice new house, and I'll warrant you no plaster will fall down from the ceiling *there*, nor either floor or gable give way. Every thing will be right when we get to — Street. The house, under this system of feeling, begins to wear a desolate look. Every thing is permitted, according to the old Scottish phrase, just to hang as it grows. The whole bonds of household discipline are relaxed. The servants, who are to be changed too, perhaps, as well as the house, begin to do things *any way*, and yet the mistress hardly chides them. The fact is, she has given up all idea of comfort in the condemned house, and lives entirely on the hope of seeing every thing trig in her new abode. She would make no great complaint, as we verily believe, if the servants obliged her by their carelessness to spend all the remaining part of the lease up to her knees in water. Every thing will be right when we get to — Street, so we'll just put up with it. Every now and then one of the children comes in, like the messengers in Macbeth, to tell her of the progress of mischief. One has to mention, that a boy throwing stones has just broken two panes in the drawing-room window, the lower chess having been up at the time. No matter; all will be right when we get to — Street. Another "cream-faced loon" rushes in to say, that the girls in the kitchen have just broken down the grate, and snapped the poker in two. No matter; all will be right when we get to — Street. Nay, it is not too much to suppose that, although she were told of the house having just begun to sink into the earth, she would take it all with the most philosophic coolness, and console herself for every present mishap by a reference to the joys which are to be experienced in that home of promise. The prospect of a removal, it will be observed, is thus enough even to revolutionise human nature. People abandon their most cherished objects of care, and disregard that of which they are in general most solicitous, under the influence of this prospect. Like the pilgrim of Bunyan (not to speak it profanely), they thrust their fingers in their ears, in order to shut out all lateral subjects of thought, and rush on—on—on towards the new house.

At last the throes of actual removal begin to be felt, and, for the time, all happy anticipation is deadened within us. You have long ago ascertained, by a ceremonious call upon the present tenants of your new mansion, that they cannot remove an hour before Whitsunday at noon, which gives you the comfortable assurance that your flitting will be, like a sharp fever, soon over. The lady who is coming to *your* house, soon after makes a ceremonious call upon *you*, and ascertains, of course, that you can only remove at that hour also. If matters should happen otherwise—if you are either going to a house altogether new, or to one which can be vacated a short while before the term-day, then what a convenience it is! we shall have the painters in, and get it all put to rights before we fit a single stick; and after it is all right, we shall move quite at our leisure. By this plan we shall not only avoid the risk of breaking things, which is always the case in a hurried flitting, but we

shall get porters and carters a great deal cheaper, for these fellows, you know, charge three wages on the actual term day, when every body is flitting. But if it should happen, as above mentioned, that you are limited to a few hours, so that your furniture, as it goes out, will meet the furniture of another person coming in, and, as it goes in, will meet, in tug of war, that of another person coming out, then the blessed anticipation of your future comforts in "that nice house" reconciles you to every thing, and you make yourself think that, after all, it is better, when one is flitting, to have it all over in the shortest possible space of time.

Sometimes, even when you have a vantage space, you are strangely jockeyed out of it before you are aware. Say the house is to be painted before you go into it. Being quite at your ease, you are satisfied that the painters are engaged about two months before the term. You know very well that these men are the greatest of all rascals; that, indeed, they have no other principle within them but just to put people to as much trouble as possible. But two months! that must surely be sufficient. Well, the painters come all this time before the term, and, like the ancient Spanish navigators, take possession of a newly discovered country, mark the job for their own, by planting a nasty pail in one room, and setting up a brush on end against the wall in another. You look in about a week after, and see the pail and the brush *in statu quo*: the fellows have as yet done nothing but taken *seisin*.* You think this is not just quite right, and, calling in a cool easy way at the master's as you go home, express your wish that the job should be immediately proceeded with, being anxious to get into the house as long before the term as possible. The painter is all politeness, and promises to *put men upon the house* next morning, so that it will be got ready for your reception in *no time*—by which he appears to mean a space of time so brief as not to be worth defining, but which you eventually find to have signified that the job would be finished *not at all in time*. As you come home to your dinner next afternoon, you take a turn that way to see how "the men" are getting on. The house is as empty and desolate as ever; but, from a change in the relative situations of the pail and the brush, you see that they *have been* there. On inspecting things more minutely, you find that one bed-room has been washed down, and is now, to use a kitchen phrase, *swimming*. Well, this is a beginning, you think. The men have been doing what they could to-day, and to-morrow they would be a good way advanced. On this supposition, you take no more thought about the house for three or four days more, when, dropping in as before, you have the satisfaction of seeing that there is *another pail*, and that the ceiling of the dining-room has been whitewashed. Still, dilatory as the rascals evidently are, you hardly think there is a sufficient *casus fœderis*, or breach of treaty, to entitle you to go and blow up the polite man at headquarters. You suffer for another day, and, then dropping in again, you find a little Flibbertigibbet of a boy exerting himself with his tiny arms to whitewash the ceiling of the parlour. Well, my boy, where are "the men?" This is your question; but for answer you only learn that there have never been any men in the matter—nobody has ever been here but Flibbertigibbet himself. You feel, at this intelligence, almost as much bewildered and obfuscated as George the Second was when he asked an Irish serjeant at a review, after the seven years' war, where was the — regiment? and was answered, "Please your Majesty, I see the — regiment," the Hibernian being in reality

* A ceremony in the law of Scotland by which a man becomes invested with a piece of land or house property.

the only man that had survived the last campaign. Is this *the men*, you say to yourself, that Mr ——— promised to put upon the house? You go of course instantly, and Mr ——— being, by his own good fortune, from home, you leave a note for him, expressed in such terms as you are sure must bring him to his senses, if any thing will. Dropping in next day to see the effect, your ire is soothed at finding three men at work besides Flibbertigibbet, and every thing seems going on so well that you trouble them no more for a week. But it is needless to pursue this painful theme any farther. Suffice it to say, that, having once got these artists into the house, you feel by and bye as if they were never again to be got out; you fear that, contrary to the catastrophe of the well known jest, there will be no letting go the painter. Their pails, and buckets, and brushes, and all their slopery, are just as rife in the house a week before the term as they were a month earlier; and still to every remonstrance Mr ——— replies, that all he can do is to *put on more men next Monday morning*. It is all you can do, perhaps, to get the odious varlets trundled out, "pots and all," on the very day before you are compelled to remove; so that, instead of having ample scope and verge enough, as you expected, you find that you will be just as much hurried and flurried as if you had been going to a house not previously vacated.

Well, whatever be the foregoing circumstances, flitting day at last arrives in all its horrors. The lady of the household has for several days been storing all kinds of small things by into drawers and boxes, that they might the more safely be transported, so that the family finds itself already deprived of the half of those things which are necessary to comfort, and the whole of what minister to luxury. Your shaving-box is amissing two mornings before flitting day, and has to be fished up, like a "drowned honour," from the bottom of some abyss of well-regarded trifles. When you come home to dinner on flitting-day-even, it is any money for a bootjack. You take your meals that evening without tablecloths; and unless you can bring down your proud stomach to a brown kitchen bowl, any thing like a comforting drink is out of the question. The crepuscular anguish of the day is already felt. You go to your bed that night off an uncarpeted floor, and in the midst of all kinds of tubs covered up with packsheet, and looking-glasses swaddled up in linen. If you get a nightcap, you may consider yourself lucky above all mortal men. You go to bed; but sleep there is none, for you have to rise next morning long before the usual hour, and the anticipatory sense of what you have to go through that day fills every nook and cranny of your mind. You awake to a rush of children and servants on the stairs; and though you exert every nerve of your memory to recollect the new geography of things in the room, it is ten to one but you stumble over some tub or chest in the dark, where you thought no tub should be; and, upon the whole, the feeling with which you thrust your poor cold distressed shanks into your vestments is not much short of that which must possess a man about to walk to the scaffold. A breakfast composed of every thing but the proper materials, and taken out of every thing but the proper vessels, collects such a group of shabby slatternly figures as you did not before think yourself husband, or father, or master to. The meal is gulped in agonies of haste, for the carts were to be at the door at seven exactly, and it is now within a few minutes of the hour. Well, the carts come; one by one are your household gods displaced and packed up on those vehicles. Grates are placed on the breadth of their backs at the bottom, by way of ballast. Then mattresses go over them, to make an agreeable flooring for other things. Tables are tumbled a-top, with their legs reared high in the air, like cart-horses enjoying themselves in their Sunday pastures; and to the ropes with which the heaps are bound down, are attached fry-pans, children's toys, and other light articles, all by way of garnishing. Though far above such things in general, you are obliged on this occasion to see after very mean details, lest your property should suffer some dreadful damage. The more delicate articles are necessarily entrusted to porters or other serviceable individuals, who carry them separately to your new house. "The boys," glad to escape the school for a day, are employed, to their great satisfaction, in transporting single things "which don't break;" and the servants see after certain baskets of crystal and crockery "which do." To see all things properly disposed of—each to the individual best fitted for it—is your business, and no easy one it is. At length, after every thing is fairly packed off, the lady and yourself walk away together, the cat following in a pillow-slip under the charge of your second eldest daughter.

Before three in the afternoon, the whole of your furniture, broken and whole, has been thrust, higgly-piggly, into your new house, where you find all things in the most chaotic state of confusion. Kitchen things repose in the dining-room; drawing-room chairs are deposited in the kitchen; and a huge chest of drawers stands in the vestibule, with a shoulder thrust so far out into the *fair way* as to render it almost impossible to pass. The kitchen grate is only to be built in after six o'clock in the evening, when the masons are released from their day's work; so there is no possibility of cooking any thing. A *provisional* arrangement is therefore made on this point. You, and your wife, and your children, and all your assistants, bivouack in some shabby parlour, and regale yourselves (*absit elegancia*)

with rolls and porter. Henry, your eldest son, who has wrought like a Turk all day, leads the feast with his coat off, and the scene can only be compared to a rough-and-tumbling in the back woods of America. No ceremony as to knives. Rolls, and even large loaves, are torn through the middle, and large mouthfuls dug out from the mass by the thumb or fore-finger. The liquor goes round in some ordinary vessel, never before appropriated to such a purpose, and all feeling of discomfort being stolen away by the novelty and strong natural feeling of the occasion, the jest and laugh abound. Even in the midst of all the disarray, great hopes and expectations are expressed regarding the new mansion. Such capital high ceilings! Such a broad elegant lobby! So different from that dismal hole we have left! Or, if the ceilings are low and the lobby narrow, while in the former house they were the reverse, the contrast is drawn in reference to some other point, where superiority is indisputable, while the demerits of the new abode are cast discreetly into shade, only to be brought out and complained of at the approach of next Candlemas. You either have left a good view from the windows, or you are entering upon one. Suppose your former house, being in the centre of the town, had hardly any view, then your wife thus comments upon it:—"Such a dark confined place! Nothing to be seen from the windows but the opposite houses, or else the chimney-stalks and *old wives*. Now, here we are quite in the country. The drawing-room commands Fife and North Berwick Law, and even from the bed-rooms we catch a great lump of the Dalmahoy hills. If we just step to the end of the house, we are into the fields; and then we'll be so very quiet here, compared with what we were. Not a carriage or a cart passing from morning till night. We'll get some rest at last; and truth to tell, my health is in great need of it. How truly delightful thus to get fairly out of that black, smoky, noisy town, to a place where we can enjoy all the pleasures of the country, and yet be within reach of every convenience of the city! And just consider how much benefit the walk must be to your own health. We formerly lived so near your place of business, that you got no exercise at all, seeing that I never could prevail upon you to take a walk on purpose. But here you *must* walk, and the good it must do you will be visible in a week's time," &c. &c. &c. If the case has been totally the reverse, you are addressed as follows:—"How delightful to get fairly away from that cold, out-of-the-world, dull place, and once more feel ourselves snug in the town! We've no prospects here from the windows; but, 'deed, when folk have prospects, I never see that they make much use of them. For my part, I never looked out of the drawing-room windows once in the month; for what are the Fife hills or North Berwick Law after one has once seen them? [What philosophy we have here!] And then, what good did we get from the garden? It was just a fash to keep right; and I'm sure, when we had paid the gardener, we did not make a penny off the vegetables. Now, here, although there be little prospect from any of the windows, we're at least a great deal better protected from the wind. If we have not a garden of our own, have we not the green market almost at the door? And such a weary distance you had to walk every day! No more of that now. Here, when you want a walk, you can take one; and when you don't like, you can let it alone. Walks are very well, perhaps, in good summer weather; but I've no idea of seeing you plash through a long dirty road twice every day through the whole winter. Whenever we want either a walk or a prospect, we'll get it in the Queen Street gardens; for you know Mrs ——— has told me that we may have her key whenever we like. In our old ill-contrived house we had no place to put any thing off our hand; not so much as a cupboard in the whole house; but now, you see, we have as many presses as rooms, and a capital cellar for coals and lumber. And how near we are here to all the best shops! If it were for nothing but the convenience of getting tea-bread at a minute's warning from Mr Littlejohn, the baker's, whenever any person calls upon us in the evening, it would have been worth while to remove to this house. The lass likewise tells me that there is a very obliging woman, quite at hand, who keeps a mangle for the use of the neighbourhood, which will be a great convenience to the family; and that she will take in hand to supply us with milk or cream at any hour of the day," &c. &c. Thus, it will be observed, neither the spirit of discontent nor the spirit of hope is ever without material for feeding its particular necessities.

You have now got fairly into your new house, bag and baggage. It is after the manner, however, of a certain pound of comfits which a carrier once brought from a city confectioner to a country customer. The paper bag having proved insufficient in the journey, the contents had dispersed themselves throughout all the other packages in the cart. Every parcel, and bag, and box, had to be shaken clear of the lurking carry, till the whole of the bulky articles having been discharged and laid off, the little white particles were found at the bottom mingled with straws, fragments of rope, and paper, and all other kinds of trash. The whole having been swept out, however, the honest old carrier brought them to the owner in a large platter, saying, with the air of a man who has relieved his conscience of some uncommon weight, "Here they are, mistress; ye ha' them a' for me." Just like the comfits are all your goods and chattels—your ox, and your ass, and your children, and your every thing else—the whole are there; but in such a state! Perhaps, to add to your distresses, you have to delay putting the principal rooms to rights till the painters have to be with you. This, of course, adjourns the termination of your agonies *sine die*. Perhaps, about three months after, when you have battled the rascals out of one room into another, much after the manner of the siege of St Sebastian, you get at last into the enviable attitude, "as you were," resolving of course never again to remove as long as you live, but still as ready before next 2d of February to take that step as ever.

POPULAR INFORMATION ON SCIENCE. FIRST ARTICLE.—INTRODUCTORY.

IN the present number of the Journal, a new, and, it is hoped, a most agreeable feature of the work, is developed. Encouraged by the favourable manner in which the papers entitled "Popular Information on Literature" have been received, the Editor now offers the first of a series of articles on scientific subjects, which will be treated in the same humble and unpretending style, and be thereby adapted to the capacities and the tastes of even the most unlearned of his readers. In this age of intellectual excitement, innumerable means have been devised for the purpose of diffusing the blessings of education throughout all classes of society; and schools of art have been judiciously instituted, and popular lectures delivered, with the view of communicating, in the most easy and familiar manner, those principles of science which explain the different phenomena of nature, and the process of art by which we can supply the wants and the luxuries of life. But so advantageous an opportunity as this widely disseminated paper offers, of opening the treasures of scientific knowledge to the people at large, never before occurred. Henceforward, therefore, the Journal will at intervals bring home to every fireside in the kingdom a portion of that species of information which has hitherto been confined to schools and lecture rooms, or published in an expensive and too elaborate form for general use. A perfect simplicity of diction will be a guiding rule in the composition of these articles. Scientific knowledge has unfortunately often been neglected from an idea that it can only be obtained by those who already possess considerable information. But this is an error; for nature is simple in all her operations, and these may be rendered as intelligible to the mind of the humble and unlettered peasant, as to that of the erudite and high-born philosopher. It is true that formerly, partly from ignorance, or the imperfection of language, and partly from an ungenerous desire to fetter the progress of the human mind, the simplest truths were studiously veiled in obscurity; but the fanciful signs and figures—the crude and complicated phraseology—the harsh and unmeaning technical terms which were then in vogue, have been exploded, and the path to the temple of science is now open, easy of access, and even strewn with flowers.

Science admits of two general divisions; the first comprehends investigations into the nature and operations of our own minds; the second into the various properties and conditions of matter, or the objects which we observe in the external world. It is by examining these that we become acquainted with the laws of nature, without some knowledge of which we must continually pass over unnoticed numerous objects and events that would otherwise excite the greatest possible interest and admiration. Nor is this all; for when any event does occur of so uncommon and striking a kind as must arouse our attention, and so disturb this repose of ignorance, being unable to explain it on fixed principles, we must have recourse to the suggestions of fancy, which invariably lead to the most absurd and extravagant superstitions. Comets, meteors, thunder and lightning, northern lights, rainbows, every phenomenon of nature, has in its turn excited those superstitious feelings which appear natural to man in a state of ignorance. Comets at a very early period were regarded as prodigies, which appeared in the heavens to forebode the most dismal calamities, such as wars and pestilence, the dethronement and death of kings, and the destruction of empires. Thus, in the history of Rome we observe how much undue importance was attached to the comet that appeared before the Augustan war, and to that which attended the battle of Pharsalia; nor has the Jewish historian Josephus been sparing of them at the destruction of Jerusalem. At this period it was imagined that they were merely flaming meteors. But the progress of discovery has enabled astronomers to examine their nature more accurately, to point out the orbits they describe, and to predict with certainty the periods of their return. Hence they have prognosticated the re-appearance of a comet of six years and a half duration in the November of the present year; and already the voice of superstition has been raised in Germany, where some have ignorantly predicted that it will destroy our earth. But no such event is likely to happen, as it will in its nearest position remain at a distance of sixteen millions of leagues from it, according to the calculation of the most distinguished astronomers in France. Meteors, which so much more frequently occur, have also excited the apprehension of the vulgar, who have fancied them to bear along the spirits of the departed, and to be the certain precursors of death. The account, says Mr M'Pherson, given to this day by the ignorant, is very poetical. The ghost comes mounted on a meteor, and surrounds twice or thrice the place destined for the person to die in, and then goes along the road through which the burial is to pass, shrieking at intervals; at last the meteor and the ghost disappear above the burial-place. Thunder and lightning have also been regarded as occurrences out of the ordinary course of nature. The Jews were accustomed to open their doors and windows during a thunder-storm, as they expected amidst this commotion of the elements the appearance of the Messiah. In Athens, when a person was struck dead by lightning, the spot

on which the accident occurred was railed in, and an altar raised for sacrifice to the Gods. The Catholics in Suabia, and other districts of Germany, toll the bells of the churches during the continuance of a thunder-storm. The apprehensions of the ignorant, which gave rise to such customs, have, from the advancement of science, been dispelled, and we now have learned, by a very simple contrivance, to rob the cloud of its lightning, and to protect our houses and public buildings from its otherwise disastrous effects. Northern lights have in like manner given rise to many absurd conjectures and predictions. If of a pale appearance, they were supposed to be the precursors of famine; if of a brilliant crimson colour, to be ominous of pestilence and war. Even the rainbow, which "compasseth the heaven about with a glorious circle," has given rise to numerous fanciful notions. Altars were raised to it by the Athenians; and even in the earlier ages of Christianity, to the colours it exhibits was assigned a mysterious interpretation. The red and green colours were considered to be significant of the destruction of the world by water and fire; and in others were recognised typical allusions to the mysteries of baptism and the holy Eucharist. These, and other superstitions we might enumerate, shew that without some knowledge of the elementary principles of science, we not only fail to observe and appreciate, but are apt to place an absurd and mischievous interpretation on the most interesting and beautiful phenomena of nature.

By the aid of scientific principles, derived from the observation of a few facts of the most simple kind, and which are capable of immediate demonstration, we are enabled to explain the properties and effects of light—the sources, operations, and various applications of heat—the composition of air and water, and the various kinds of earths, minerals, metals, and other substances, which enter into the structure of the globe we inhabit. Besides which, there are numerous phenomena of very frequent occurrence which claim peculiar attention—the varied and often lovely colours that are seen reflected along the sky—the formation and varieties of clouds—the condensation and fall of snow, hail, rain, and dew—the motions of the air, sea and land breezes, trade winds, whirlwinds, the hurricane, the tornado, and the simoon—the various appearances which prognosticate change of weather—the transparency, the glowing tints and depths of the ocean, with the motion of its waves, its tides, its currents, and its whirlpools—the lakes, rivers, and springs which so beautifully diversify the face of nature—the terrible convulsions which, under the form of earthquakes, lay the proudest cities in the dust, and overwhelm with fear the heart of man—these, and innumerable other wonders of creation, are calculated to arouse even in the most languid mind a spirit of inquiry, which, once excited, will go along upon its path rejoicing, fully conscious that at every step it is gathering power and enlarging the boundaries of human happiness. Natural historians, moralists, poets—all mankind, are accustomed to speak of the exceeding beauties of nature; but these cannot be felt nor sufficiently appreciated without being properly understood; and this therefore is one of the strongest inducements for us to cultivate such knowledge, for whatever may be the sphere of life in which we have been destined to move—whatever may be the occupations or the duties we may have to perform, or the cares and anxieties that may oppress us—there are times when we escape from these into the free open air, to wander perhaps through the fields or along the sea shore, or through the suburbs or streets of a city; and the mind so informed then carries with it a talisman by which it can always summon up the most interesting subjects for its contemplation. But besides the above inquiries, which relate principally to what is called inorganic matter, when we have examined the irregularities of the earth's surface, its plains and its vallies—its hills and mountains—its level shores and stupendous rocks, it will remain for us to consider the numerous tribes of organic beings which in these different regions find their appropriate habitations. We shall find that the vegetable creation alone opens up to us a world which first bewilders us with the multitude of its beauties and wonders, and then charms us into meditation. All plants, from the humble moss clinging to its barren rock, to the majestic oak of the forest—from the neglected weed on which we tread, to the lovely flower it is our pride to cultivate, are under the influence of the same immutable laws—they all require light, heat, air, and moisture; they all possess a living principle, and require a certain quantity and kind of nutriment, which is elaborated into sap, and converted into different kinds of matter for the leaves, flowers, and fruit; they have all the faculty of reproduction, whereby the same species is continued, and they all grow, attain maturity, and then die; and their decayed remains, even as human dust, then contribute to the formation of the soil of the earth, which is always by such means in the course of renewal. The seeds and fruits of some of these plants, by processes of art, are converted into food, instances of which we have in the numerous kinds of grain now cultivated in Britain; others into materials which supply us with the means of clothing, examples of which we recognise in the hemp, flax, and cotton plants; others yield important medicinal substances, by which we are enabled to mitigate and often subdue the sufferings and

progress of disease; besides which, we need scarcely add that timber of different kinds is applied to so many common purposes of life, that it forms a most important article of commerce.

Thus the vegetable kingdom not only adorns the world with verdant loveliness, but all its productions, its grasses, herbs, shrubs, and trees, are adapted to supply the numerous conveniences of man. But not man alone thence derives support and enjoyment; the plants that grow beside rivers, the shrubs that adorn the sides of rocks, the trees that are grouped together, and form extensive forests—all afford nutriment and protection to myriads of living beings. Here tribes of insects that have as yet escaped the notice of the naturalist, and birds whose notes of melody no human art can rival, fly at liberty; there, too, secure from the usurpation and dominion of man, animals, in their wild and undomesticated state, find shelter. As the principle of life which exists in plants does not lead to the obvious manifestation of any sentient or thinking principle, they have been placed at the lower part of the scale of organized beings, ascending from which the numerous living beings that inhabit the air, the waters, and the earth, and which exhibit a regular chain of gradation from the most simple to the most complicated structures, engage our attention and interest. These we likewise find governed by certain general laws—they all require light, heat, air, and food—they all have the power of multiplying their individual and distinct races—they all grow and enjoy the power of locomotion—they have all senses which warn them of the approach of danger, and enable them to select the substances which are most proper for their nutriment—they have all their appropriate regions of distribution, some being the inhabitants of hot, others of cold climates, some being destined to live on the heights of mountains, others in the bosoms of vallies—they have all habits which are connected with certain peculiarities visible in the structure of their several physical frames—they all endure only a temporary existence, some of them living only for a few minutes, others for many hundred years. Finally, the remains of their disorganising bodies, like the plants of which we have spoken, contribute to the formation of the soil on which we tread. The naturalist, finding himself perplexed by the multitude of these animated beings, has arranged them according to their respective forms and habits into certain general divisions, and these again he has subdivided into particular classes, genera, species, and varieties. At the head of these, pre-eminently distinguished by the faculty of speech, and the powers of his mind, we find man, whose knowledge, when tempered with humanity, teaches him humility, forbearance, and gentleness to all living things. In his uncivilized state man is perhaps a more abject and helpless being than any other that moves on the face of creation; nor is it until the light of reason dawns that he can perceive how to minister to his numerous necessities and comforts. Naked, unarmed, exposed to all the inclemencies of the weather, he seeks only to redress his immediate physical wants. His hunger he satisfies by eating the fruits of the trees, or the roots of herbs—his thirst he slakes at the river's side, and his only habitation is the depth of otherwise unfrequented woods. In this state he has no language to articulate his ideas; but we turn from a picture humiliating to human vanity, to contemplate man in his more civilized state, enjoying all the luxuries which have been conferred upon him by the progress of the arts and sciences. It is said that Rome itself originally consisted only of a few mud cottages irregularly scattered, and Vitruvius informs us that even in his time the Temple of Romulus was preserved, thatched with straw. Such was the origin of that proud city, which afterwards became the mistress of the world, and this is only a type of the great changes, improvements, and contributions to happiness that have been, and will be effected, by the progress of the human mind.

Great Britain itself, which has held so pre-eminent and commanding an attitude among other nations, has in like manner arisen from a humble origin; and to what may her glory and prosperity be principally attributed? To the advanced state of the arts and sciences; it is this which led to her conquests both by land and by sea; it is this which at the present moment forms the broad basis of her commerce. The application of the principles of science to her different manufactures has brought many of them to a state of most wonderful perfection; nay, it is impossible to examine them without experiencing the highest gratification. When, therefore, it is considered that the knowledge of a few principles of chemistry will enable us to understand the most interesting processes of art, surely it is a desirable attainment, more especially as it requires no very great sacrifice of time nor intense application to study. By the union of potash and a certain kind of sand, and the application of heat, glass is formed, which supplies us with the means of enjoying light in our habitations, at the same time that it excludes the inclemency of the weather. The old English historian, Bede, informs us that in the seventh century it was not known how to make window-glass in England; and we read in Henry's History of Great Britain that before this period the windows of houses, and even of cathedral churches, admitted light through fine linen cloths, or lattices of wood. The greatest im-

provements have taken place in the mode of manufacturing glass, which now forms an important part of British trade. The arts of bleaching, dyeing, and tanning, are likewise chemical operations, which may be understood without difficulty. The process of bleaching is one of great antiquity; for we learn from Theophrastus, who lived 300 years before Christ, that lime was then employed in bleaching. Here again the bleacher has been considerably indebted to the progress of science, without knowing the elementary principles of which, it is not possible to understand the action that takes place in this process. In dyeing, not a colour can be imparted unless an affinity or attraction exists between the cloth and the dye; and if this is not present, the dyer is obliged to have recourse to some other agent, which he then employs as a bond of union between them. If we digest some indigo in a little common vitriol, and dilute it largely with water, and then insert into the solution a piece of silk, linen, or cotton, we shall find, on taking it out immediately, that the indigo combines with the cloth, and gives it a blue colour. But if, instead of indigo, we make an infusion of cochineal, logwood, or madder, and immerse the cloth in the coloured liquid, we shall find that there is so slight an attraction exerted between the colouring matter and the fibres of the cloth, that it only receives a stain, which may be removed by washing. In this case the third substance is requisite to combine the colouring matter with the cloth, and render the dye permanent: this is what is termed the mordant or basis, which generally consists of a certain preparation of iron or tin. Here, therefore, we perceive that the process of dyeing depends on a chemical action, which admits of a very simple explanation. The act of tanning can likewise only be understood by having recourse to the science of chemistry, which has taught us that, in the barks of trees, more especially of the oak kind, a substance is obtained called tannin, which may be made, by a very simple process, to combine with skins, so as to form leather. Besides these, the mode of extracting metals from their different ores, in order that they may be converted subsequently into various utensils, and the important art of agriculture, require a knowledge of chemical principles. Even the most simple culinary processes, daily going forward in our kitchens, proceed likewise on principles of chemistry, which we ought to understand. Accordingly, that distinguished philosopher, Count Rumford, did not disdain to exercise the powers of his scientific mind in devising means to improve the art of cooking. He endeavoured to ascertain how the greatest quantity of nutriment could be obtained from food at the least possible expense; and so well did he succeed, that in one of his establishments at Munich, three women were sufficient to prepare a dinner for a thousand persons, and they burned only ninepence worth of fuel. He went so far in his improvements as even to economise all the heat of the smoke; and hence it was said that he would soon be found cooking his dinner with the smoke from his neighbour's fire. We might here adduce numerous other examples to illustrate the universal application of the principles of science, but sufficient has been said to show how much there is to amuse and interest the mind as it advances along the path of useful knowledge. In conclusion, we may observe that the information which thus qualifies us to appreciate the beauties of nature, and which enables us to understand the different processes of art, should exert the happiest and most beneficial effects on human character; for such meditations are calculated to elevate the thoughts, refine the feelings, enrich the imagination, and render us happier as we proceed on our pilgrimage through the world.

ITINERATING LIBRARIES.

I HAVE much pleasure in bringing under the notice of the people of Great Britain generally, an institution calculated to be of the greatest service in the diffusion of knowledge, but which is as yet little known beyond the limits of a particular district in Scotland. About forty years ago, or shortly after the impulse given to the public mind by the revolution in France, an urgent demand began to be manifested over most parts of Scotland for the perusal of instructive publications, less limited in their range in literature than had prevailed throughout the preceding age. Reading associations sprung into existence, frequently under the fostering care of the landed gentry and clergy; and it will be recollected by my readers, that our national poet, Burns, whose active genius appreciated this scheme of widening the scope of human intelligence, was instrumental in forming one of those book societies in a country part of Dumfriesshire. Since that epoch, libraries in the proprietary of a body of subscribers, chiefly in the middle and lower ranks of life, have, with much advantage, been set on foot in every town and populous village in the kingdom. Scotland has therefore for at least a quarter of a century been in the enjoyment of a very beneficial system of mental cultivation by local libraries, and this alone has formed a most interesting feature in its intellectual statistics.

But no human institution is perfect. The country libraries labour under a natural defect, for which no ingenuity can offer a remedy, unless by a total alteration in the character of the institution. It has been found that in almost every instance the desire for knowledge, through such means, has been quenched in the limited amount of the volumes; or, in other words, that the subscribers have read the library out, and that more speedily than new books can be added for their gratification. Thus, stationary country libraries cease to ex-

cite much interest after a few years, and the objects of so valuable an institution are, in a certain sense, as completely frustrated as if the library were altogether removed. A remedy has, however, been found, most effectual in its design and tendency. Arrangements have in some places been made to establish libraries in a series, moveable from place to place, so that as soon as the inhabitants of a village have read one library, it moves off, and another supplies its place. These are called *ITINERATING LIBRARIES*, and I now purpose to say a few words regarding them. To whom the merit is due of inventing this almost magical mode of circulating books, I have never heard; but whoever he was, his name deserves to take its place alongside of the inventors of paper and printing. With an obscurity hanging over the origin of the practice, it can be stated with precision, that it was first made known in East Lothian, and very greatly improved by the indefatigable and philanthropic exertions of Mr Samuel Brown, merchant in Haddington, son of the late Dr John Brown of that place. According to Mr Brown's mode, there is a head station (which seems absolutely necessary), where the books lie for some time, after which they are sorted and put in operation, always coming back to the head station at the end of every two years before they pass on to another district. This appears to be necessary, for the purpose of repairing the damaged volumes, and infusing new books into the stock. The system pursued by Mr Brown, I give by an extract from a communication with him on the subject. "The plan of itinerating libraries (says he) was introduced in 1817, and it has been attended with a degree of success unexampled in the history of reading associations. It commenced with five divisions (or libraries) of fifty volumes each; and there are now, in 1830, upwards of 2000 volumes belonging to the institution. The new books are kept for a few years at the head library at Haddington for the use of subscribers, and afterwards they are arranged into divisions of fifty volumes, and stationed in the towns and villages of the country for two years, when they are removed and exchanged. The regular removal and supply of new divisions has excited and kept up such a disposition to read, that in several stations there is frequently not a volume left in the library box. To persons acquainted with the issues from the usual settled libraries of 2000 volumes, or even of a much smaller number, and of thirteen years' standing, the following statement will appear almost incredible:—The issues of books at Haddington to the subscribers have been nearly eight and a half times per annum for every volume kept in them. The gratuitous issues at Haddington have been seven and a half times every volume; at Gifford, Salton, Aberlady, North Berwick, Belhaven, and Spott, they have been seven times every volume; and the issues of the whole establishment, so far as reported, have been on an average five times for every volume, or 10,000 issues of 2000 volumes." It may be explained, that the divisions of books are all kept in boxes, or presses, and deposited with careful individuals. In all cases these librarians have acted gratuitously. The books are purchased chiefly from the accumulation of voluntary subscriptions, or small annual charges. I believe it is now proposed to issue the books the first year that a division is in the place, at the rate of a penny a volume; but as a subscription, however small, might essentially impede the success of the scheme, and as it is of immense consequence to bring the books within the reach of the whole population, particularly of the young, they will continue to be issued gratuitously the second year. It is mentioned in a memoir relative to these itinerating libraries, that a single library of fifty volumes, with book-case, catalogue, labels, advertisements, and issuing books, may be procured at from L.10 to L.12. A series of fifty divisions for one of the Scottish counties might perhaps be formed for L.500. Hitherto these East Lothian libraries have been in some measure made up by donations of books; and I am confident that when gentlemen who have large libraries, containing many books they do not often require, are aware of the prodigious benefit which may result to the country by assisting the institution in this manner, they will hasten to present the head establishments which may be formed with liberal donations. A single volume lying unnoticed in a corner of their book-shelf may be thus made to diffuse its concentrated knowledge over the peasantry of a whole country. Mr Brown has published a number of reports relative to the libraries under his charge, from which it appears he possesses very sanguine notions as to the extension of his scheme over the whole United Kingdom, nay, even over the West India and American colonies, if not the whole world. Now, it is quite evident that the progress of these beneficial establishments can only follow in the tread of the schoolmaster, and be successful where a certain degree of mental cultivation has been already effected. He speaks of a great head institution in London, something like the Central Bible Societies, as being necessary in the development of his plan. I would admonish him and all others to drop so crude and preposterous a project. Great head institutions are in general great jobs, for they are conducted by men who serve merely for pecuniary emolument, and care little for the *morale* of their establishments. Let the plan of the East Lothian itinerating libraries be copied from county to county; let local excitement only be put in force; let a few spirited and liberal minded men, belonging to different classes of the community, but club their intelligence to set the libraries agoing in their vicinities, and there can be no question that the whole country will, in a brief space of time, be covered with the desired establishments. In the success which has attended Brown's itinerating libraries in Haddingtonshire, another useful lesson is read to mankind. We find that in this, as in almost every other great good bestowed on the species, the benefit has been conferred by a *single individual*, and not by a society, the drivelling formalities of which, in rare instances, prevent everything like an efficiency of action, and retard far more than they quicken the genius of human improvement.

THE PECHS.

EVERY child in Scotland has heard of the Pechs, a race of small red-haired men, who are said to have lived long ago, and built all the huge castles and bridges in the country.

The Picts, whom antiquaries suppose to have been the same as what are called the Pechs, are understood to have been the people who lived in the country north of the Forth, about a thousand years ago. They had a king of their own for many ages; but at length a race of Irish adventurers, who came in upon Scotland by the west, got the better of their monarch, or else succeeded to his crown by marriage, so that there was never any more heard of them as a separate nation. This event is said to have taken place in the year 843.

Tacitus, a Roman historian of the second century, describes these Picts as a tall and fair race; but tradition now speaks differently of the Picts. Both in the border counties, and in those which the Picts once occupied, they are represented by the common people, and in all nursery stories, as a squat and robust race of men, with red hair, and arms of such length, that they could tie the latches of their shoes without stooping. The Scottish peasant ascribes all old public works of which he does not know the origin to the Pechs, and their plan of working, according to his creed, was to stand in a row between the quarry and the building, handing forward stones to one another. When a person has either red hair, long arms, or a very sturdy body, it is common to say to him tauntingly, "Ye maun be come of the Pechs." Yet there is also a very prevalent understanding that they are now entirely extirpated, at least as a nation; and there are some popular tales which even speak of the death of the last individual of the race.

The inhabitants of Lammermoor, a lonely mountain region between East Lothian and Berwickshire, have a tradition that the last battle fought by the Pechs against the Scots, by whom they were oppressed, took place near a hill called Manslaughter Law. So dreadfully were they cut up, that only two persons of the Pictish nation survived the fight, a father and a son. These were brought before the Scottish king, and promised life on condition that they would disclose the secret, peculiar to their nation, of the art of distilling ale from heather. But this was a secret upon which the Pechs prided themselves very much, so that, it is said by Boece in his history, they never would divulge it except to their own kindred. Both had refused to purchase their lives on this condition, and they were about to be put to a painful and torturing death, when the father seemed to relent, and proposed to yield up the secret, provided that the Scots would first kill his son. The victors, though horrified at the unnatural selfishness of the old man, complied with his request, and then asked its reward. "Now," said the ancient Pech, "you may kill me too, for you shall never know my secret. Your threats might have influenced my son, but they are lost on me." The king of Scots could not help admiring this firmness of principle, even in so small a matter as small ale, and he condemned the veteran savage to life. It is further related by the tradition of Teviotdale, that his existence, as a punishment from heaven for his crime, was prolonged far beyond the ordinary term of mortal life. When some ages had passed, and the last of the Pechs was blind and bed-ridden, he overheard some young men vaunting of their feats of strength. He desired to feel the wrist of one of them, in order to compare the strength of modern men with those of the early times, which were now only talked of as a fable. They reached him a bar of iron instead of a wrist, that they might enjoy the expressions of indignation which they thought he would be sure to utter. But he seized the huge bar, and, snapping it through like a reed, only remarked very coolly, "It's a bit gey gristle," but naething to the shackle-banes o' my young days." The feelings of the young men may be imagined. Into such forms as these do historical facts become transmuted after a long series of ages; and such is the popular remembrance of a nation which once occupied the greater part of this country, but the very existence of which is now a matter of historical certainty.

THE LADY OF WOODHOUSELEE.

ON the left bank of the North Esk, betwixt Roslin and Auchindinn, stand the few remaining ruins of the old house of Woodhouselee, which seems to have been a castellated mansion of a commanding appearance. The scenery around, which is exceedingly beautiful, has furnished a theme for many a romantic ballad, and the locality is connected with a tragic circumstance of more than ordinary interest, which occurred in the year 1569, during the troubles of the reign of Queen Mary. Crawford, in his memoirs of the affairs of Scotland, relates the event in the following words:—"With regard to Hamilton of Bothwellhaugh, he was one of those who, among bold and loyal men of that clan, fought for the Queen at Langside, was then taken prisoner and sentenced to be hanged, but afterwards made his escape, and was forfeited. His wife, who was heiress of Woodhouselee, not thinking her husband's crimes would affect her estate, willingly abandoned that of Bothwellhaugh, in Clydesdale, which was his ancient patrimony, and took possession of her own property; but the Earl

of Moray being informed of the matter by Sir James Ballandine (a mighty favourite of his, to whom he had gifted Woodhouselee), sent some officers to take possession of the house, who not only turned the gentlewoman out of doors, but stripped her naked, and left her in that condition in the open field, in a cold dark night, where, before day, she became furiously mad, and insensible of the injury they had done her." From this moment, Bothwellhaugh, her husband, resolved on putting Moray, the Regent, to death, which he accomplished, as is well known, at Linlithgow, by firing upon him from a balcony, on the 23d of January, 1569. From the place of assassination Bothwellhaugh rode straight to Hamilton, where he was received in triumph; for the ashes of the house in Clydesdale, which had been burned by Moray's army, were yet smoking. After a short abode at Hamilton, this fierce and determined man left Scotland, and served in France, under the patronage of the family of Guise, to whom he was doubtless recommended by having revenged the cause of their niece, Queen Mary, upon her ungrateful brother. The carbine with which he shot the Regent is preserved at Hamilton Palace. It is a brass piece of a middling length, very small in the bore, and, what is rather extraordinary, appears to have been rifled or indented in the barrel. It had a match lock, for which a modern firelock has been injudiciously substituted. To return to Woodhouselee, the scene of the above melancholy event: The country people around were long possessed of the idea that the ruins of the mansion were tenanted by the restless spirit of the Lady of Bothwellhaugh, and which spectre is said to have been so tenacious of her rights, that a part of the stones of the ancient edifice having been employed in building or repairing the present Woodhouselee, she has deemed it a part of her privilege to haunt that house also; and even of very late years has excited considerable disturbance and terror among the domestics. This is a more remarkable vindication of the *rights of ghosts*, as the present Woodhouselee, the seat of the respectable family of the Fraser Tytlers, is situated on a slope of the Pentland Hills, distant at least four miles from her proper abode. In Pinkerton's Collection of Scottish Songs he gives one from tradition, entitled the Laird of Woodhouselee, the substance of which is, that at a great feast, where there were present full twenty "golden dames," every one with her knight, each lady being called on to give to the minstrels the name of her favourite, in order that they might celebrate his prowess and accomplishments in verse, the Lady of Woodhouselee commanded them to sing Salton's praise. Her Lord, taking offence at such an order, expressed his anger in a manner which alarmed her; whereupon she consulted her nurse, who advised her to poison him, and prepared the poison, which the lady administered in a glass of wine. News coming to the father of his son's death, and the supposed cause, he immediately repaired to the King, and, throwing himself at his feet, besought just vengeance on the murderess. The King, incensed at the lady's crime, ordered her to be burnt at the stake; and the ballad closes with her lamentation, and admonition to take warning from her fall.

THE RESOLVE.

In imitation of an old English Poem.

BY SIR WALTER SCOTT.

My wayward fate I needs must 'plain,
Though bootless be the theme;
I loved, and was beloved again,
Yet all was but a dream:
For, as her love was quickly got,
So it was quickly gone;
No more I'll bask at flame so hot,
But coldly dwell alone.
Not maid more bright than maid was e'er
My fancy shall beguile
By flattering word, or feigned tear,
By gesture, look, or smile;
No more I'll call the shaft fair shot,
Till it has fairly flown,
Nor scorch me at a flame so hot—
I'll rather freeze alone.
Each ambush'd Cupid I'll defy,
In cheek, or chin, or brow,
And deem the glance of woman's eye
As weak as woman's vow;
I'll lightly hold the lady's heart,
That is but lightly won;
I'll steel my breast to beauty's dart,
And learn to live alone.
The haunting torch soon blazes out,
The diamond's ray abides;
The flame its glory hurls about,
The gem its lustre hides.
Such gem I fondly deemed was mine,
And glow'd a diamond stone;
But, since each eye may see it shine,
I'll darkling dwell alone.
Nor waking dream shall tinge my thought
With dyes so bright and vain;
No silken net, so slightly wrought,
Shall tangle me again;
No more I'll pay so dear for wit,
I'll live upon mine own;
Nor shall wild passion trouble it—
I'll rather dwell alone.
And thus I'll hush my heart to rest—
Thy loving labour's lost;
Thou shalt no more be wildly blest,
To be so strangely crost.
The widowed turtles mateless die,
The phoenix is but one;
They seek no loves—no more will I—
I'll rather dwell alone.

ON THE PRESERVATION OF HEALTH. CLEANLINESS—BATHING.

This is the purest exercise of health,
The kind refresher of the summer heats.

THOMSON.

THE enjoyment of sound health of body, next to that of sound health of mind, is one of the greatest of terrestrial blessings, and a few plain observations on the best mode of attaining this state of physical comfort may be perused with advantage. The science of preserving health is generally comprehended under the term *Dietetics*, which has a reference to cleanliness, the preparation and consumption of food, air, exercise, rest, the passions, sleep, and other matters connected with the functions of the body. Among the lower animals, who are governed by an unerring instinct, there is no need for the correction of abuses in the healthful preservation of the body; but man, who is the creature of circumstances, and who has been left to be governed by his reason so as to suit his taste and convenience, stands constantly in need of advice on the general heads just referred to. Our artificial mode of living, the prodigious variety of our employments in and out of doors, our different modes of dwelling and dressing, the endless variety of substances used as food and drink, the great diversity of national customs and manners, the difference and changeableness of climate, and our vicious indulgences, have all a powerful influence on our physical welfare. By our present mode of living we are certainly stronger in frame and of greater longevity than savages (though there is a prejudice to the contrary), but we pay the penalty of this superiority in our liability to numberless complaints originating in the artificial habits of social life.

I do not imagine that persons who live in ordinary intercourse with society can pretend to exist like anchorites, or follow every rule laid down for the preservation of their health; but I do believe that, with a little firmness and no great sacrifice of feeling, a very excellent state of health may be obtained, even with our present artificial practices. All who have studied the condition of the human body lay down *personal cleanliness* as the first thing to be attained in the pursuit of health, and without this all other means will prove abortive. The outer skin of the human body is composed of the most minute scales, between which are interstices, or openings, called pores, from whence constantly exude the liquid matter which we denominate perspiration, but which is, in fact, the refuse of the internal blood. The quantity of perspiration daily exuded, under ordinary circumstances, is from one to two pounds weight, and it is essential to our existence that this should be projected outwards. As the clothes worn next the body act as sponges for the receipt of perspirable matter, they should invariably be preserved in the most cleanly condition; for if they be soiled or impure, they will not receive the liquid effusion, which is consequently lodged on the skin, and returned to the internal parts by the absorbents, greatly to the injury of the health. It is impossible to lay too much stress on this most important fact in dietetics. The clothes, whether of woollen or linen, worn next the skin, should be frequently changed—the oftener the better; but even this precaution, excellent as it is, will not preserve uniform sound health, unless the skin be from time to time thoroughly purified with water. The inhabitants of this country, and indeed of most countries, are culpably negligent in not generally attending to this point in cleanliness. Almost all the great law-givers and founders of religion, from the remotest antiquity, seem to have been aware of the influence of personal cleanliness upon the moral character of man, and have strongly inculcated it. In many cases it has been interwoven with the most solemn rites of public and private worship; and is so still, in a particular manner, in Mahomedan countries.

Let all clothes, linen, beds, blankets, and other articles coming in contact with the body, be kept in the most cleanly condition—that is, free of the perspired matter. Let the body, and particularly the joints, be frequently washed with pure water, especially in summer. The face, neck, and hands, ought to be daily washed, both morning and evening. In washing the face, the cold water should be always laved behind the ears and on the back part of the neck, by which practice toothach will in a great measure be prevented. The mouth should be well rinsed every morning with water, and the teeth simultaneously rubbed with the finger, which is considered to be better than a brush. It has been found that frequent shaving of the beard is conducive to free perspiration, and, consequently, to health. I would particularly recommend that the feet be very frequently washed. If bathed every morning in cold water, the complaint of *cold feet*, now so prevalent, would seldom be heard.

Bathing of every description is the basis of cleanliness, and may be pronounced one of the most beneficial restorers of health and vigour. To persons enjoying a perfect state of bodily vigour, the frequent use of the bath is less necessary than to the infirm, as the healthy possess a greater power to resist infirmities by means of their unimpaired perspiration, the elasticity of their minute vessels, and the due consistence of their circulating fluids. The case is very different with the infirm, the delicate, and the aged. In these the slowness of circulation, the viscosity or clamminess of the fluids, the constant efforts of nature to propel the impurities towards the skin, combine to render the frequent bathing or washing of their bodies an essential requisite to their physical existence. Although most persons acknowledge the propriety of frequent bodily ablution, there are not many who are fond of putting their belief in practice; they will tell you that they have no time, no convenience, for bathing. But these are frivolous excuses. It is their indolence which afflicts them; and rather than clean themselves, they will run the chance of having their health impaired, and live in a state of perpetual bodily discomfort. Every one has the use of

water, and could easily spare a few minutes for so highly beneficial a process as washing themselves. On the other hand, those who indulge in the judicious practice of bathing enjoy a more active state of body and more durable state of robust health than those who do not. Bathing may be performed with hot or cold water, according as feelings dictate, or circumstances permit. The lukewarm or tepid bath, from 85 to 95 degrees of heat, is always safe; and the temperature may be raised to 102 degrees without danger to healthy persons. So far is the hot bath from relaxing the tone of the solids, that it may justly be considered as one of the most powerful restoratives with which we are acquainted. Instead of heating the body it has a cooling effect, and diminishes the quickness of the pulse. Hence, tepid baths are of eminent service, where the body has been overheated, from whatever cause, whether after fatigue from travelling, severe bodily exercise, or after violent exertion and perturbation of mind. By their softening and moistening power, they greatly contribute to the formation and growth of the body of young persons.

Bathing in rivers, as well as in the sea, is effectual for every purpose of cleaning the body; it washes away impurities from the surface, opens the cutaneous vessels for a due perspiration, and increases the circulation of the blood. For these reasons it cannot be too much recommended, not only to the infirm and debilitated, under certain restrictions, but likewise to the healthy. The apprehension of bad consequences from the coldness of the water is in reality ill-founded; for, besides that it produces a strengthening effect by its 'astringent' property, the cold sensation is not of itself hurtful. In a recent publication, entitled "The Economy of the Human Body," the author makes the following judicious observations on cold bathing:—"The best time for bathing is about noon, or two or three hours after breakfast. Cold bathing should never be practised when the body is loaded with food. For invalids, the morning is improper, as being chiller, and the body not having been invigorated by a slight meal. This is another popular error which ought to be corrected. Invalids and the delicate should plunge twice or thrice into the water, then come out, and have the body immediately rubbed dry with cloths. Practice will gradually enable a person to remain longer in the water; and the robust may enjoy the luxury for a considerable time with the most perfect impunity; but whenever chilliness, drowsiness, and inactivity, are felt after coming out, these are sure indications that either cold bathing does not agree with the constitution, or that too long time has been spent in the water. Sea water is most efficacious as a cold bath, for there is a stimulating quality in the salt which gives a grateful glow to the skin. There is a popular belief that it is necessary to plunge head foremost into the water, else a determination of blood to the head takes place, and headaches, &c. follow. Nothing can be more erroneous. A sudden plunge is often productive of mischief, but it is not necessary to wet the whole head in bathing, especially if there be too much hair, which, afterwards, taking a long time to dry, is often inconvenient. Whenever after a short immersion in the cold bath the individual feels chill, his skin pale, and the lips and nails of a purplish hue, it is a proof that cold bathing does not agree with him." With these useful observations I may here close this first branch of the subject of Dietetics.

A GLANCE AT ENGLISH HUSBANDRY.

WHEN a Scotchman travels for the first time through England, he sees much to engage his attention in the landscape not peculiar to his own end of the island. Independent of the general levelness of the land, and the other more prominent features of the country, he marks the difference in the disposition of the fields and the ordinary arrangements of the rural *manège*. Two things he particularly notices—the singular smallness of the enclosed fields, which seem no bigger than a common-sized kitchen garden, and the great quantity of them laid in grass. In some counties these peculiarities are not observable; but taking the country in the mass, they are essentially its most striking characteristics. Accustomed in Scotland to see fields of a large extent under an active process of husbandry for grain crops, he cannot well make out the cause for occupying so considerable a portion of the English soil with thick thorn hedges, and he is perhaps informed that much of the land is preserved under grass, so as to be free of a certain description of tithes. In all the arts of trade and commerce, England entered on its illustrious career several centuries before its northern neighbour; in the arts of agriculture it also obtained the advantage of priority; but it is indisputable that in this branch of industry it has been perceptibly outstripped, and may award the merit to Scotland. The revival of agriculture in Scotland—I say its revival, for it retrograded in consequence of the wars of the succession—though only of a date within the period of the last century, has been followed up with a most unprecedented energy and a signal success. Within the compass of ninety or a hundred years almost every instrument of husbandry of an ancient construction has disappeared, and been succeeded by implements formed on an efficient scientific principle. Thrashing machines, some moved by steam, are universal. A Scotchman acquainted with these distinctions in the husbandry of North Britain, is amused in beholding in the south instruments of field labour, waggons for conveying grain to market included, evidently as ancient and clumsy in construction as they were in the days of the Saxon Heptarchy. In Northumberland, some parts of Yorkshire, Norfolk, and other places, this is certainly not the case; but over the greater part of England and Wales it would appear that the public mind has not yet been roused to the value of the improvements I mention.

Yet how glorious is the appearance of this noble country in the verdant and luxurious months of summer, with its endless flourishing fences, its fields dotted with trees, its beautiful lawns and orchards, and its hearty ho-

nest peasantry, with their trim cottages and gardens. Let us take a glance at this highly favoured region. Entering by the "Eastern Marches," we find Northumberland, distinguished as an agricultural district, and in this respect bearing a resemblance to the Merse, on this side of the Tweed. The size of the farms is said to vary from L.50 to L.500 in rent. In Cumberland, grazing has long been the principal object of the farmers; extensive enclosures, however, have been recently made, and considerable quantities of flour and oatmeal are now exported. The dairies are small, but the butter is of excellent quality. There is much hilly, bleak land in Westmoreland and Cumberland, suitable only for sheep pasture. The Durham farms are in general small in extent, but excellent and powerful horses are bred here, and the cattle, by suitable feeding, are brought to a large size. In the East Riding of Yorkshire, particularly upon the wolds, agriculture is conducted upon a large scale, and has arrived at a high pitch of perfection. Half a century ago barley and oats were the principal kinds of grain produced here, and oat-bread was chiefly used by the inhabitants; now the valleys and the slopes of the hills wave with wheat. The western levels, also, have received great improvements. Within less than thirty years vast commons in its southern part have been enclosed and cultivated; and a dreary and swampy waste is now covered with well-built farmsteads. The horses of Yorkshire have long been justly celebrated; they are bred principally in the East and North Ridings.

Proceeding into Lancashire, we find it generally more backward in its agriculture, and famous only for its potatoes. In Cheshire we find agriculture well understood, but the land chiefly devoted to the feeding of cattle for dairy produce. The cheeses of Cheshire, including those made in Shropshire, are the best in Britain. Agriculture is the essential and almost the whole pursuit of the inhabitants of Herefordshire; they also devote great attention to their orchards, which we find in every situation. Cyder and perry are produced to a great amount. Hops are cultivated on the borders of Worcester, and at the centre of Nottinghamshire. Staffordshire is not remarkable for its agriculture. Grazing, or breeding and feeding stock, is the great object of the Leicestershire farmer. More than half the land is constantly in pasture. Cheese is made to a great extent. Leicestershire is also eminent for its breed of beautiful black horses. In Northamptonshire dairies are numerous and extensive. Cattle are fed in great numbers. Agriculture is in a low state. The country here grows wood for dyers. The rich vales of Gloucestershire are chiefly devoted to the produce of the dairy and the rearing of cattle. The Gloucester and double Gloucester cheese are the produce of different districts. In a part of this county called the Forest, there is much oak and forest trees, and one place has furnished 1000 tons of ship timber annually for a course of years. The husbandry of Oxfordshire is not of an approved character. In Buckinghamshire, vast numbers of oxen are fed, and butter is made in great quantities. The chief produce of Bedfordshire are corn and butter.

In the eastern district of England lies Lincolnshire, remarkable for its flat land or fens, formerly inundated by the sea, which, being now protected by great embankments, form one of the richest tracks in the kingdom. The drainage of them has been chiefly accomplished within the last 40 or 50 years, and is still going on. Upwards of 150,000 acres have in this manner been reclaimed, yielding annually L.150,000, exclusive of all expenses. The fertility of the improved lands is in many places extraordinary, owing, it is supposed, to their great impregnation with sea salt. They are all adapted to ordinary crops, but are chiefly devoted to grazing. In the summer season they are covered with innumerable flocks and herds, which, from the luxuriance of the pastures, grow to an amazing weight. In winter, much of the land being overflowed, nothing is to be seen but a wide expanse of water, varied with a number of sea-fowl. Many of the fens are devoted to the breeding and rearing of geese, which here form a highly valuable stock. Their quills and feathers are sent in immense quantities to the London and other markets. The northern part of Cambridgeshire forms the Isle of Ely, which is almost a complete marsh. In these low lands, the towns and villages, built upon elevated spots, appear like islands. The soil is extremely fertile, and produces luxuriant crops of wheat and oats. The aspect of Norfolk, though in some places diversified by little swells, is generally uninteresting. The soil is not naturally fertile, but has been greatly improved by cultivation. Agriculture is here conducted upon the most improved system. Suffolk is in general level, and the climate is reckoned the driest in the kingdom; the cows of this county are excellent milkers. Hertfordshire is reckoned the first corn county in England. Essex is level, but in general sufficiently elevated to be dry and arable. In Kent, hops are grown to a great extent, and also various other horticultural plants and roots. Almost the sole business of the Middlesex agriculturists is to provide articles of necessity for the metropolis, in the vicinity of which the land is mostly rented by cow-keepers, gardeners, and nurserymen. Surrey is behind in its agriculture. Sussex is one of the most beautiful counties in England, being richly clothed with wood, covered with orchards, and disposed in fertile fields.

In the southern district of England, we find Hampshire, distinguished for its agriculture. Wiltshire, especially in its south division, is almost entirely devoted to sheep pasture. Dorsetshire is also pastoral. Proceeding into the west of England, the traveller will be pleased with the appearance of Somersetshire, which possesses every gradation of surface. The plains are remarkable for their luxuriant herbage. Possessing a climate mild and genial, this county stands high in reputation for its agricultural produce. Devonshire is partly open and uncultivated, and partly fine vales, laid out in orchards, or cultivated in a style of improvement. The Devonshire cyder rivals that of Herefordshire. In conclusion, the agriculture of Cornwall is rude, the

mines attracting the chief attention of the inhabitants. I have thus rapidly sketched the local characteristics of English husbandry, which, even under the most improved modes, is in a general sense inferior to that seen in the best agricultural districts of Scotland, where the new scientific instruments of labour, the ingenuity and educated habits of the peasantry, the scheme of leasing land on an enlarged principle, the rotation of cropping, and many other advantageous circumstances, have combined to bring farming in the north to the very height of perfection.*

SCENES IN PALESTINE.

On the following day (says Carne, in his letters from the East) we ascended the side of Carmel, next to the sea, into which it almost descends; and on this part of its summit tradition says that Elijah the prophet stood when he prayed for rain, and beheld the cloud rise out of the sea. The next day we ascended the mountain in another part, and traversed the whole of its summit, which occupied several hours. It is the finest and most beautiful mountain in Palestine, of great length, and in many parts covered with trees and flowers. On reaching at last the opposite summit, and coming out of a wood, we saw the celebrated Esdraelon beneath, with the river Kishon flowing through it; Mounts Hermon and Tabor were in front; and on the left the prospect was bounded by the hills of Samaria. On the following day we arrived at Nazareth, which we could not perceive till we were at the top of the hill directly over it, as it stands at the foot and side of a kind of amphitheatre. Its situation is very romantic; the population amounts to about twelve hundred, who are mostly Christians. The Spanish Catholic convent, in which all travellers are accommodated, is a large and excellent mansion. The church of the convent is rich, and contains a fine organ. Below the floor, and entered by a flight of steps, is the cave or grotto where the angel Gabriel is said to have appeared to Mary; a granite column was rent in twain by the appearance of the angel; the lower part is quite gone, but the upper part, which passes through the roof, is suspended in the air. "There is a handsome altar in this grotto. We next visited a small apartment which is shown as the workshop of Joseph; this stands at a short distance from the church; part of it only remains, and is certainly kept very neat. Not far from this is the school where our Lord received his education, and which looks much like other schools. But as curious a relic as any, is a large piece of rock, rather soft, about four feet high, and four or five yards long, its form not quite circular;—on this our Lord is said to have often dined with his disciples.

About a mile and a half down the valley is shown a high and perpendicular rock, as the very spot where our Lord, according to St Luke, was taken by the people to be thrown over the precipice. About midway down, in the face of the rock, is the spot where his descent was arrested, and the mark of his hands, and part of his form, are shown, where he entered into the rock and disappeared. Such are the tales of the fathers of the convent. But of far higher interest than traditions and relics is the scenery around Nazareth; it is of the kind in which we would imagine the Saviour of mankind delighted to wander and to withdraw himself when meditating on his great mission; deep and secluded dells, covered with a wild verdure, silent and solemn paths where overhanging rocks shut out all intrusion. No one can walk round Nazareth without feeling thoughts like these enter his mind, while gazing often on many a sweet spot, traced perhaps by the Redeemer's footsteps, and embalmed by his prayers.

The next day we rode to Mount Tabor, about six miles distant; it stands alone on the plain, and is a very small and beautiful mountain, rising gradually on every side; about the fourth part of the ascent towards the summit is covered with a luxuriance of wood. The top of Mount Tabor is flat and not of large extent; the view from thence is most magnificent. At the foot is shown the village, amidst a few trees, that was the birth-place of Deborah the prophetess. Hermon stands in the plain about six miles off, and at its foot is the village of Nain. We next proceeded towards Cana by a narrow and rocky path over the mountains. This village is pleasantly situated on a small eminence in a valley, and contains two or three hundred inhabitants; the ruins of the house are still shown where the miracle of turning the water into wine was performed. The same kind of stone waterpots are certainly in use in the village; we saw several of the women bearing them on their heads as they returned from the well.

Proceeding on our journey, we wound along the coast, passing by the site of Cæsarea, and arrived at Joppa or Jaffa. The appearance of Jaffa is singular, being situated on so steep a declivity that the houses almost climb over each other up the face of the hill. A dark and naked room is shown as having been the residence of Simon Peter, the tanner. We were now only twelve hours' journey from Jerusalem, and rode to Ramtha early on the following day: this place is finely situated on an extensive plain, and has some woods and olive trees around it. By moonlight next

morning we were on the way to the sacred city: for about three hours it led over the plain, and then ascending the hills, became excessively disagreeable, in some parts so narrow that one horse only could proceed at a time, and that not always with safety. At the end of nine hours, however, as we proceeded over the summit of a rugged hill, we beheld Jerusalem. Its aspect certainly was not magnificent or inspiring, but sad and dreary. On reaching the gate of Bethlehem, we were speedily admitted, and, after some research, procured a lodging in the house of a native, not far from the walls, and near the tower of David. The morning after my arrival was a very lovely one, and, though it was in February, perfectly warm. I passed out of the gate of Bethlehem, and, traversing part of the ravine beneath, ascended the Mount of Judgment, on the south side of the city. How interesting was her aspect, beheld over the deep and rocky valley of Hinnom! her gloomy walls encompassing Mount Zion on every side; and as yet there was no sound to disturb the silence of the scene. The beautiful Mount of Olives was on the right, and at its feet the Valley of Jehoshaphat, amidst whose great rocks and trees stood the tomb of Zacharias, the last of the prophets that was slain; the only stream visible flowed from the fountain of Siloam, on the side of Zion opposite. It is true the city beloved of God has disappeared, and with all its hallowed spots once contained within its walls; and keen must be the faith that can now embrace their identity. Yet the face of nature still endures—the rocks, the mountains, lakes, and valleys, are unchanged, save that loneliness and wildness are now where once were luxury and every joy; and though their glory is departed, a high and mournful beauty still rests on many of these silent and romantic scenes. Amidst them a stranger will ever delight to wander, for there his imagination can seldom be at fault. The walls of Jerusalem can with ease be walked round on the outside in 45 minutes, as the extent is scarcely three miles. On the east of the city runs the Valley of Jehoshaphat, on the south and west that of Hinnom, and into these descend the steep sides of Mount Zion, on whose surface the city stands. To the north extends the plain of Jeremiah, the only level space around; it is covered partly with olive trees. It does not appear probable for the ancient city to have covered a larger space than the present, except by stretching to the north, along the plain of Jeremiah; because the modern walls are built nearly on the brink of the declivities of Zion and the adjoining hill. But the height of the hill is very small, for Jerusalem is on every side, except towards the north, overlooked by hills higher than the one whereon it stands. The circumstance that most perplexes every traveller is, to account for Mount Calvary's having been formerly without the city. It is at present not a small way within; and in order to shut it out, the ancient walls must have made the most extraordinary curve imaginable. Its elevation was probably always inconsiderable, so that there is little to stagger one's faith in the lowliness of its present appearance.

AMERICAN LUMBERERS.

The timber trade, which, in a commercial as well as a political point of view, is of more importance in employing our ships and seamen, and the occasioning a great addition to the demand for British manufactures, than it is generally considered to be, employs a vast number of people in the British colonies, whose manner of living, owing to the nature of the business they follow, is entirely different from that of the other inhabitants of North America. Several of these people form what is termed a "lumbering party," composed of persons who are all either hired by a master lumberer, who pays them wages, and finds them in provisions, or of individuals, who enter into an understanding with others, to have a joint interest in the proceeds of their labour. The necessary supplies of provisions, clothing, &c., are generally obtained from the merchants on credit, in consideration of receiving the timber which the lumberers are to bring down the rivers the following summer. The stock deemed requisite for a "lumbering party" consists of axes, a cross-cut saw, cooking utensils, a cask of rum, tobacco and pipes, a sufficient quantity of biscuit, pork, beef, and fish, pease and pearl barley for soup, with a cask of molasses to sweeten a decoction usually made of shrubs, or of the tops of the hemlock-tree, and taken as tea. Two or three yokes of oxen, with sufficient hay to feed them, are also required to haul the timber out of the woods. When thus prepared, these people proceed up the rivers, with the provisions, &c., to the place fixed on for their winter establishment, which is selected as near a stream of water as possible. They commence by clearing away a few of the surrounding trees, and building a shanty, or camp, of round logs, the walls of which are seldom more than four or five feet high, the roof covered with birch bark, or boards. A pit is dug under the camp to preserve any thing liable to injury from the frost. The fire is either in the middle, or at one end; the smoke goes out through the roof; hay, straw, or fir branches, are spread across, or along the whole length of this habitation, on which they all lie down together at night to sleep, with their feet next the fire. When the fire gets low, he who first awakes or feels cold springs up, and throws on five or six billets, and in this way they manage to have a large fire all night. One person is hired as cook, whose duty is to have breakfast ready before day-light, at which time all the party rise, when each takes his "morning," or the indispensable dram of raw spirits, immediately before breakfast. This meal con-

sists of bread, or occasionally potatoes, with boiled beef, pork, or fish, and tea sweetened with molasses; dinner is usually the same, with pease soup in place of tea; and the supper resembles breakfast. These men are enormous eaters, and they also drink great quantities of rum, which they scarcely ever dilute. Immediately after breakfast, they divide into three gangs, one of which cuts down the trees, another hews them, and the third is employed with the oxen in hauling the timber either to one general road leading to the banks of the nearest stream, or at once to the stream itself; fallen trees, and other impediments in the way of the oxen, are cut away with the axe. The whole winter is thus spent in unremitting labour. The snow covers the ground from two to three feet from the setting in of winter until April, and, in the middle of fir forests, often till the middle of May. When the snow begins to dissolve in April, the rivers swell, or, according to the lumberer's phrase, the "freshets come down!" At this time, all the timber cut during winter is thrown into the water, and floated down until the river becomes sufficiently wide to make the whole into one or more rafts. The construction of the vast masses of timber floated down the St Lawrence, and other great rivers of America, is nearly on all occasions similar, but bound proportionally stronger together as the rafts increase in size. The raftsmen commence by floating twenty or more pieces of timber alongside each other, with the ends to form the fore-part of the raft brought in a line, and then bound close together by logs placed across these, and by binding one log to another with poles fastened down by withes plunged firmly into holes bored in the logs for the purpose. The size of the raft is increased in this manner by adding pieces of timber, one after another, with their unequal lengths crossing the joints, until the whole lot of timber to be rafted is joined together in one flat mass on the river. The water at this period is exceedingly cold, yet, for weeks together, the lumberers are in it from morning till night, and it is seldom less than a month and a half, from the time that floating the timber down the stream commences, until the rafts are delivered to the merchants. No course of life can undermine the constitution more than that of lumberer and raftsmen. The winter, snow, and frost, although severe, are nothing to endure in comparison to the extreme coldness of the snow-water of the freshets, in which the lumberer is, day after day, wet up to the middle, and often immersed from head to foot. The very vitals are thus chilled and sapped; the intense heat of the summer sun, a transition which almost immediately follows, must further weaken and reduce the whole frame, and premature old age is the inevitable fate of a lumberer. But notwithstanding all the toils of such a pursuit, those who once adopt the life of a lumberer prefer it to any other. They are in a great measure as independent, in their own way, as the Indians. After selling and delivering up their rafts, they pass some weeks in idle indulgence, drinking, smoking, and dashing off in a long coat, flashy waistcoat and trousers, Wellington or Hessian boots, a handkerchief of many colours round the neck, a watch with a long tinsel chain and numberless brass seals, and an umbrella. Before winter, they return again to the woods, and resume the laborious pursuits of the preceding year. The great number of the lumberers and raftsmen in Canada and New Brunswick are from the United States. Many young men of steady habits in our colonies are in the habit of joining the lumbering parties for two or three years, for the express purpose of making money; and, after saving their earnings, purchase or receive grants of lands, on which they live very comfortably, cultivating the soil, and occasionally cutting down the timber trees on their lands for market.—*McGregor's British America.*

MY SISTER KATE: A MORAL TALE.

There is a low road (but it is not much frequented, for it is terribly round about) that passes at the foot of the range of hills that skirt the long and beautiful gut or Firth of the Clyde, in the west of Scotland: and as you go along this road, either up or down, the sea or firth is almost at your very side, the hills rising above you; and you are just opposite to the great black and blue mountains on the other side of the gut, that sweep in heavy masses, or jut out in bold capes, at the mouth of the deep lochs that run up the Firth into the picturesque highlands of Argyleshire.

You may think of the scene what you please, because steam-boating has, of late years, profaned it somewhat into commonness, and defiled its pure air with filthy puffs of coal smoke; and because the Comet and all her unfortunate passengers were sunk to the bottom of this very part of the Firth; and because, a little time previous, a whole boatful of poor highland reaper girls were also run down in the night-time, while they were asleep, and drowned near the Clough lighthouse hard by; but if you were to walk this road by the seaside any summer afternoon, going towards the bathing village of Gourcock, you would say, as you looked across to the highlands, and up the Clyde, towards the rock of Dumbarton castle, that there are few scenes more truly magnificent and interesting.

There is a little village exactly opposite to you, looking across the Firth, which is called Dunoon, and contains the burying place of the great House of Argyle; and which, surrounded by a patch of green cultivated land, sloping pleasantly from the sea, and cowering snugly by itself, with its picturesque cemetery, under the great blue hills frowning behind, looks, from across the Firth, absolutely like a tasteful little haunt of the capricious spirit of romance.

Well, between this road, on the lowland side of the Firth, and the water's edge, and before it winds off round by the romantic seat of Sir Michael Shaw Stewart, farther up, there stand, or stood, two or three

* For the facts in the above paper, my authority is "*Bell's Geography, Popular and Scientific*,"—a work I cannot sufficiently commend for the accuracy and comprehensiveness of its details.

small fishing cottages, which, from the hills nearly over them, looked just like white shells, of a large size, dropped fancifully down upon the green common between the hills and the road. In these cottages, it was observed, the fishermen had numerous families, who, while young, assisted them in their healthful employment; and that the girls, of which there was a number, were so wild in their contented seclusion, that if any passenger on the road stopped to observe them, as they sat in groups on the green mending their father's nets, they would take alarm, and rise and run off like fawns, and hide among the rocks by the sea, or trip back into the cottages. Now it happened, once on a time, that a great event took place to one of the cottager's daughters, which, for a long period, deranged and almost destroyed the happy equality in which they had hitherto lived; and becoming the theme of discourse and inquiry concerning things beyond the sphere of the fisher people and all their neighbours, as far as Gourrock, introduced among them no small degree of ambition and discontent.

There was one of the fishermen, a remarkably decent well disposed highlandman, from the opposite shore of Argyllshire, named Martin M'Leod, and he had two daughters, the youngest of which, as was no uncommon case, turned out to be remarkably and even delicately beautiful.

But nobody ever saw or thought anything about the beauty of Catharine M'Leod, except it might be some of the growing young men in the neighbouring cottages, several of whom began, at times, to look at her with a sort of wonder, and seemed to feel a degree of awe in her company; while her family took an involuntary pride in her beyond all the others; and her eldest sister somehow imitated her in every thing, and continually quoted her talk, and trumpeted about among the neighbours what was said and done by "my sister Kate."

Things continued in this way as Kate grew to womanhood; and she was the liveliest little body about the place, and used to sing so divertingly at the house-end, as she busied herself about her father's fishing gear, and ran up and down "among the brekans on the brae," behind the cottages, or took her wanderings off all the way to the Clough lighthouse at the point. I say things continued in this way until a gentleman, who, it turned out, was all the way from London, came to lodge in Greenock, or Gourrock, or Innerkip, or somewhere not very far distant; and, being a gentleman, and, of course, at liberty to do every sort of out of the way thing that he pleased, he got a manner of coming down and wandering about among the cottages, and asking questions concerning whatever he chose of the fishermen; and then it was not long until he got his eyes upon Kate.

"The gentleman," as her sister used to tell afterwards, "was perfectly ill, and smitten at once about our Kate. He was not able," she said, "to take the least rest, but was down constantly about us for weeks; and then he got to talking to and walking with Kate, she linking her arm in his beneath the hill, just as it had been Sir Michael Stewart and my lady; and then such presents as he used to bring for her, bought in the grand shop of Baillie Macnicol, at Greenock; gowns, and shawls, and veils, and fine chip hats, never speaking of ribbons, an' lace edging, an' mob caps—perfect beautiful."

The whole of the other fishermen's daughters became mad with envy of poor Kate, and admiration of her new dress, which some said was mostly bought by her father after all, who wanted to have his daughter made a lady of; and now nothing was heard in the hamlet but murmurings and discontented complaints; every girl looking at herself in the little cracked glass that her father used to shave by, to see if she were pretty, and wishing and longing, not only for a lover of her own, but even for a gentleman. So, as matters grew serious, and the gentleman was fairly in love, old Martin M'Leod, who looked sharply after Kate, behaved to have sundry conversations with the gentleman about her; and masters being appointed to teach her right things, which the fisher folks never heard of, but which were to turn her into a lady, Kate and the gentleman, after a time, were actually married in Greenock new church, and set off for London.

During all this time, there were various opinions among the fisher people, how that Kate never was particularly in love with the gentleman; and some even said that she was in love with somebody else (for pretty maidens must always be in love), or, at least, that some of the youths of the neighbourhood were in love with her; but then the old folks said, that love was only for gentle-people who could afford to pay for it; and that when a gentleman was pleased to fall in love, no one had a right to say him nay, or pretend to set up against him. Some of the young women, to be sure, ventured to contest this doctrine, and cited various cases from the authority of printed ballads bought at the Greenock fair, at a half-penny each; and also from the traditionary literature of Argyllshire, which was couched in the mellifluous numbers of the Gaelic language; but, however this might be, the fame of Catharine M'Leod's happy marriage, and great fortune, was noised abroad, exceedingly, among the fisher people throughout these coasts, as well as about Gourrock and all the parts adjacent.

As to the gentleman, it was found out that his name was Mr Pounteney, and that little Kate M'Leod was now Mrs Pounteney, and a great London lady;

but what quality of a gentleman Mr Pounteney really was, was a matter of much controversy and discussion. Some said that he was a great gentleman, and others thought that, from various symptoms, he was not a very great gentleman—some went so far as to say he was a lord or a prince, while others maintained that he was only a simple esquire.

Nothing, therefore, could be talked of wherever Flora M'Leod went, but about "my sister Kate;" and she was quite in request everywhere, because she could talk of the romantic history and happy fortune of her lucky sister. Mrs Pounteney's house in London, therefore, Mrs Pounteney's grand husband, and Mrs Pounteney's coach, excited the admiration and the discontent of all the fishermen's daughters, for many miles round this romantic sea coast and these quiet cottages under the hills, where the simple people live upon their fish, and did not know that they were happy. Many a long summer's day, as the girls sat working their nets on a knoll towards the sea, the sun that shone warm upon their indolent limbs on the grass, and the breeze that blew from the Firth, or swept round from the flowery woods of Ardgowan, seemed less grateful and delicious, from their discontented imaginings about the fortune of Mrs Pounteney; and many a sweet and wholesome supper of fresh boiled fish was made to lose its former relish, or was even embittered by obtrusive discourse about the fine wines and the gilded grandeur of "my sister Kate." Even the fisher lads in the neighbourhood, fine fearless youths, found a total alteration in their sweethearts; their discourse was not relished, their persons were almost despised; and there was now no happiness found for a fisherman's daughter, but what was at least to approach to the state of grandeur and felicity so fortunately obtained by "my sister Kate."

The minds of Kate's family were so carried by her great fortune, that vague wishes and discontented repinings followed their constant meditations upon her lucky lot. Flora had found herself above marrying a fisherman; and a young fellow called Bryce Cameron, who had long waited for her, and whose brother, Allan, was once a sweetheart of Kate's herself, being long ago discarded; and she not perceiving any chances of a gentleman making his appearance to take Bryce's place, became melancholy and thoughtful; she began to fear that she was to have nobody, and her thoughts ran constantly after London and Mrs Pounteney. With these anxious wishes, vague hopes began to mix of some lucky turn to her own fortune, if she were only in the way of getting to be a lady; and at length she formed the high wish, and even the adventurous resolve, of going all the way to London, just to get one peep at her sister's happiness.

When this ambition seized Flora M'Leod, she let the old people have no rest, nor did she spare any exertion to get the means of making her proposed pilgrimage to London. In the course of a fortnight from its first serious suggestion, she, with a gold guinea in her pocket, and two one-pound notes of the Greenock bank, besides other coins and valuables, and even a little old fashioned Highland brooch, with which the quondam lover of her sister, Allan Cameron, had the temerity to intrust to her, to be specially returned into the hand of the great lady when she should see her, besides a hundred other charges and remembrances from the neighbours, she set off one dewy morning in summer, carrying her shoes and stockings in her hand, to make her way to London, to get a sight of every thing great, and particularly of her happy sister Kate.

Many a weary mile did Flora M'Leod walk, and ride, and sail, through unknown places, and in what she called foreign parts; for strange things and people met her eye, and long dull regions of country passed her like a rapid vision, as she was wheeled towards the great capital and proper centre of England. After travelling to a distance that was to her perfectly amazing, she was set down in London, and inquired her way, in the best English she could command, into one of those long brick streets, of dark and dull gentility, to which she was directed; and after much trouble and some expense, at length found the door of her sister's house. She stood awhile considering, on the steps of the mansion, and felt a sort of fear of lifting the big iron knocker that seemed to grin down upon her; for she was not in the habit of knocking at great folk's doors, and almost trembled lest somebody from within would frown her into nothing, even by their high and lofty looks.

And yet she thought the house was not so dreadfully grand after all;—not at all such as she had imagined, for she had passed houses much bigger and grander than this great gentleman's; it was not even the largest in its own street, and looked dull and dingy, and shut up with blinds and rails, having a sort of melancholy appearance.

But she must not linger, but see what was inside. She lifted up the iron knocker, and as it fell the very clang of it, and its echo inside, smote upon her heart with a sensation of strange apprehension. A powdered man opened it, and stared at her with an inquisitive impertinent look, then saucily asked what she wanted. Flora curtsied low to the servant from perfect terror, saying she wanted to see Mrs Pounteney.

"And what can you want with Mrs Pounteney, young woman, I should like to know?" said the fellow; for Flora neither looked like a milliner's woman,

nor any other sort of useful person likely to be wanted by a lady.

Flora had laid various pretty plans in her own mind, about taking her sister by surprise, and seeing how she would look at her before she spoke, and so forth: at least she had resolved not to affront her, by making herself known as her sister before the servants; but the man looked at her with such suspicion, and spoke so insolent, that she absolutely began to fear, from the interrogations of this fellow, that she would be refused admittance to her own sister, and was forced to explain and reveal herself before the outer door was fully opened to her. At length she was conducted, on tiptoe, along a passage, and then up stairs, until she was placed in a little back dressing-room. The servant then went into the drawing-room, where sat two ladies at opposite sides of the apartment, there to announce Flora's message.

On a sofa, near the window, sat a neat youthful figure, extremely elegantly formed, but petite; with a face that need not be described, further than that the features were small and pretty, and that, as a whole, it was rich in the nameless expression of simple beauty. Her dress could not have been plainer, to be of silk of the best sort; but the languid discontent, if not melancholy, with which the female, yet quite in youth, gazed towards the window, or bent over a little silk netting with which she carelessly employed herself, seemed to any observer strange and unnatural at her time of life. At a table near the fire was seated a woman, almost the perfect contrast to this interesting figure, in the person of Mr Pounteney's eldest sister, a hard-faced, business-like person, who, with pen and ink before her, seemed busy among a parcel of household accounts, and the characteristic accompaniment of a bunch of keys occasionally rattling at her elbow.

The servant approached, as if fearful of being noticed by "the old one," as he was accustomed to call Miss Pounteney, and in a half whisper intimated to the little figure that a female wanted to see her.

"Eh! what!—what is it you say, John?" cried the lady among the papers, noticing this manoeuvre of the servant.

"Nothing, Madam, it is a person that wants my lady."

"Your lady, sirrah! it must be me!—Eh! what!"

"No, madam; she wants to see Mrs Pounteney particularly."

"Ah, John!" said the little lady on the sofa; "just refer her to Miss Pounteney. There is nobody can want me."

"Wants to see Mrs Pounteney particularly!" resumed the sister-in-law: "How dare you bring in such a message, sirrah? Mrs Pounteney particularly, indeed! who is she, sirrah! Who comes here with such a message while I am in the house?"

"You must be mistaken, John," said the little lady sighing, who was once the lively Kate M'Leod of the fishing cottage in Scotland; "just let Miss Pounteney speak to her. You need not come to me."

"No, madam," said the servant, addressing Miss Pounteney, the natural pertness of his situation now returning to overcome his dread of the *old one*: "This young person wants to see my mistress directly, and I have put her into her dressing-room; pray ma'am, go," he added, respectfully, to the listless Kate.

"Do you come here to give your orders, sirrah?" exclaimed Miss Pounteney, rising like a fury, and kicking the footstool half way across the room, "and to put strange people of your own accord into any dressing-room in this house! and to talk of *your mistress*, and wanting to speak to her directly, and privately, while I am here! I wonder what sister Becky would say, or Mr Pounteney, if he were at home?"

"Who is it, John? Do just bring her here, and put an end to this!" said Kate, imploringly, to the man.

"Madam," said John at last to his trembling mistress, "it is your sister!"

"Who, John!" cried Kate, starting to her feet; "my sister Flora, my own sister, from Clyde side! Speak, John, are you sure?"

"Yes, Madam, your sister from Scotland."

"Oh, where is she, where is she? let me go."

"No, no; you must be mistaken, John," said the lady with the keys, stepping forward to interrupt the anxious Kate; "John, this is all a mistake," she added, smoothly; "Mrs Pounteney has no sister! John, you may leave the room;" and she gave a determined look to the other sister, who stood astonished.

The moment the servant left the room, Miss Pounteney came forward, and stood in renewed rage over the fragile melancholy Kate, and burst out with "What is this, Kate? Is it really possible, after what you know of my mind, and all our minds, that you have dared to bring your poor relations into my brother's house? That it is not enough that we are to have the disgrace of your mean connections, but we are to have your sisters and brothers to no end coming into the very house, and sending up their beggarly names and designations by the very servants! Kate, I must not permit this. I will not, I shall not;" and she stamped with rage. "Oh, Miss Pounteney," said Kate, with clasped hands, "will you not let me go and see my sister? Will you just let me go and weep on the neck of my poor Flora! I will go to a private place—I will go to another house, if you please; I will do any thing when I return to you, if I ever return, for I care not if I never come into this unhappy house more!" and, uttering this, almost with a shriek, she burst past the two women, and ran through the rooms to seek her sister.

Meantime Flora had sat so long waiting, without seeing her sister, that she began to feel intense anxiety; and, fancying her little Kate wished to forget her, because she was poor, had worked herself up into a reso-

lution of assumed coldness, when she heard a hurried step, and the door was instantly opened. Kate paused for a moment after her entrance, and stood gazing upon the companion of her youth, with a look of such passionate joy, that Flora's intended coldness was entirely subdued; and the two sisters rushed into each other's arms in all the ecstasy of sisterly love.

"Oh, Flora, Flora! my dear happy Flora!" cried Kate, when she could get words, after the first burst of weeping; "have you really come all the way to London to see me? poor me!" and her tears and sobs were again like to choke her. "Kate, my dear little Kate!" said Flora, "this is not the way I expected to find you. Do not grieve so dreadfully; surely you are not happy, Kate!"

"But you are happy, Flora," said Kate, weeping; "and how is my good highland father, and mother, and my brother Daniel? Ah! I think, Flora, your clothes have the very smell of the seashore, and of the bark of the nets, and of the heather hills of Argyshire. Alas! the happy days you remind me of, Flora."

"And so, Kate, you are not so very happy, after all," said Flora, looking incredulously in her face, "and you are so thin, and pale, and your eyes are so red; and yet you have such a grand house, Kate! Tell me if you are really not happy?"

"I have no house, Flora," said Kate, after a little, "nor, I may say, no husband. They are both completely ruled by his two vixen sisters, who kept house for him before he married me, and still have the entire ascendancy over him. My husband, too, is not naturally good tempered; yet he once loved me, and I might enjoy some little happiness in this new life, if he had the feeling or the spirit to treat me as his wife, and free himself and the house from the dominion of his sisters, especially the eldest. But I believe he is rather disappointed in his ambitious career, and in the hopes he entertained of matches for his sisters, and is somewhat sour and unhappy; and I have to bear it all, for he is afraid of these women; and I, the youngest in the family, and the only one who has a chance of being good tempered, am, on account of my low origin, forced to bear the spleen of all in this unhappy house."

"But, Kate, surely your husband would not behave so bad as to cast up to you that your father was a fisherman, when he took you from the bonnie seaside himself, and when he thought himself once so happy to get you?"

"Alas! he does indeed!—too often—too often; when he is crossed abroad, and when his sisters set him on; and that is very mean of him; and it so humbles me, Flora, when I am sitting at his table, that I cannot lift my head; and I am so sad, and so heart-broken among them all!"

"Bless me! and can people be really so miserable," said Flora, simply, "who have plenty of money, and silk dresses to wear every day they rise?"

"It is little you know, my happy Flora, of artificial life here in London," said Kate mournfully. "As for dress, I cannot even order one but as my sister-in-law chooses; and as for happiness, I have left it behind me on the beautiful banks of the Clyde. O that I were there again!"

"Poor little Kate!" said Flora, wistfully looking again in her sister's face; "and is that the end of all your grand marriage, that has set a' the lasses crazy, from the Fairly Roads to Gourcock Point. I think I'll gang back and marry Bryce Cameron after a'."

"Is Allan Cameron married yet?" said Kate, sadly. "When did ye see blithe and bonnie Allan Cameron?—Alas! the day!"

"He gave me this brooch to return to you, Kate," said Flora, taking the brooch out of her bosom. "I wish he had not given it to me for you, for you're vexed enough already."

"Ah! well you may say I am vexed enough," said she, weeping and contemplating the brooch. "Tell Allan Cameron that I am sensible I did not use him well—that my vain heart was lifted up; but I have suffered for it—many a sad and sleepless night I have lain in my bed, and thought of the delightful days I spent near my father's happy cottage in Scotland, and about you, and about Allan. Alas! I just tell him not to think more of me; for I am a sad and sorry married woman, out of my own sphere, and afraid to speak to my own people, panting my heart out and dying by inches, like the pretty silver fish that floundered on the hard stones, after my father had taken them out of their own clear water."

"God help you, Kate!" said Flora, rising; "you will break my heart with grief about you. Let me out of this miserable house! Let me leave you and all your grandeur, since I cannot help you; and I will pray for you, my poor Kate, every night at my bedside, when I get back to the bonnie shore of Argyshire."

Sad was the parting of the two weeping sisters, and many a kiss of fraternal affection embittered, yet sweetened, the hour; and anxious was Flora M'Leod to turn her back upon the great city of London, and to journey northwards to her own home in Scotland.

It was a little before sundown, on a Saturday evening, shortly after this, that a buzz of steam, let off at the Mid Quay of Greenock, indicated that a steam-boat had come in; and it proved to be from the fair sea-port of Liverpool, having on board Flora M'Leod, just down from London. The boat as it passed had been watched by the cottagers where she lived up the Firth; and several of them, their day's work being over, set out towards the Clough to see if there was any chance of meeting Flora.

Many were the congratulations, and more the inquiries, when they met Flora, lumbering homewards with her bundle and her umbrella, weary and looking anxiously out for her own sweet cottage by Clyde side. "Ah, Flora! is this you!" cried the whole at once; "and are you really here again—and how is your sister, and all the other great people in London? and, indeed, it is very good of you not to look the least proud, after coming from such a grand place!"

With such congratulations was Flora welcomed again among the light-hearted fisher people in the West of Scotland. But it was observed that her tone was now quite altered, and her own humble contentment had completely returned. In short, to bring our story to a close, she was shortly after married to Bryce Cameron, and various other marriages soon followed; for she gave such an account of what she had seen with her eyes, that a complete revolution took place in the sentiments of the whole young people of the neighbourhood.

It was observed in the hamlet that the unhappy Mrs Poutney was never named, after this, by any but with a melancholy shake of the head; the ambition of the girls to get gentlemen seemed quite extinguished; and Flora, in time, began to nurse children of her own in humble and pious contentment.—From the "Dominie's Legacy," a series of Tales, in three volumes, illustrative of Scottish Life.

Column for Housewives.

Choice Receipts for Plain Cookery, selected from *The Cook and Housewife's Manual*, by MRS MARGARET DODS.

TO BOIL A ROUND OF BEEF.

A ROUND or BUTT of salted beef may either be boiled whole, divided into two, or cut into three pieces, according to the size of the meat, and the number of the guests or family. It is a common error of vanity to boil too much of a ham or round at once. If boiled whole, the bone may be cut out; if divided, it is desirable to give each piece an equal proportion of the fat. Wash the meat, and, if over salt, soak it in one or more waters till it be sufficiently softened or freshened. Skewer it up tightly, and of a good shape, wrapping the flap or tongue piece very firmly round. Bind it with broad strong tape, or fillets of linen. The pot should be roomy, and the water must fully cover the meat. A fish drainer is convenient to boil this and other large pieces of meat on. Heat very gradually; take off the scum, of which a great deal will be thrown up, till no more rises, and throw in some cold water to refine the liquor, if needful; cover the pot close, and boil slowly, but at an equal temperature, allowing about three hours to from 12 to 16 pounds, and from that to four or five hours for a weightier piece. Turn the meat once or twice during the process. Put in the carrot and turnip about two hours after the meat. If the liquor is to be afterwards used for soup, these roots, instead of hurrying, will improve the flavour. Greens may be either boiled in the same pot, or better separately in some of the pot liquor. When the meat is dished, take off with a clean sponge, or a cloth moistened in the pot liquor, any scum or films which, in spite of the most careful skimming, will often hang about salted meat; garnish with large sliced carrots (or with greens or carrots instead), and serve washed turnip and greens in separate dishes. The meat must be cut in smooth, thin, horizontal slices, keeping the surface level. The soft fat eats best when the meat is warm, the firm fat when it is cold. By good management, the meat will, in cold weather, keep for a fortnight or more.

TO ROAST A LEG OF MUTTON.

Mutton intended to be roasted may be kept longer than mutton for boiling, as the colour is of less importance. Cut out the pipe that runs along the backbone, which taints so early; wipe off the moistness that gathers on the surface, and in the folds and doublings of the meat, and below the flap. This and every other piece of meat may be lightly dusted with flour, or with pepper or pounded ginger, which, by excluding the external air and keeping off flies, helps to preserve the meat, and can be taken off in the washing previous to roasting. A leg, a chine, a saddle, a loin, a breast, a shoulder, and the haunch, or gigot, are the roasting pieces of mutton. Joint the roast well, whatever be the piece. Most of the loose fat should be cut from the loin, which may be stuffed, and must be peppered at first to preserve the kidney-fat. This roast requires a rather quick fire to concentrate its juices. A juicy leg of mutton requires no sauce save its own gravy.

TO ROAST TURKEY, FOWLS, OR GAME.

A turkey will keep a fortnight, a fowl a week. By care they will keep much longer; that is to say, if drawn, hung in a cool dry air, wiped often, and seasoned with pepper in the inside. The sinews of the legs must be drawn (those of fowls should all be drawn, especially when the birds are old); press down the breast-bone even more than in a fowl, to make the bird look plump; be careful, in drawing, to preserve the liver whole, and not to break the gall-bladder. For stuffing to fill the craw, take a breakfast cup full of stale bread finely grated, two ounces of minced beef meat, or marrow, a little parsley parboiled and finely shred, a tea spoonful of lemon peel grated, a few sprigs of lemon thyme, a little nutmeg, pepper, and salt. Mix the whole well in a mortar, with a couple of eggs. Do not stuff too full; and with another egg work up what remains into balls, to be fried and served with the turkey. Paper the breast. Score the gizzard. Season it highly with pepper, salt, and cayenne, and drop in melted butter, and then bread-crumbs. A very large turkey will take nearly as long to roast as a sirloin. These are not the most delicate. A moderate-sized turkey will take from an hour and a half to two hours. The fire must be clear and sharp; dredge with flour when laid down. Fresh butter is always best for basting. Keep the turkey far from the fire at first, that the stuffing and breast may be done through. Hen turkeys are the most delicate, and the whitest; they are consequently preferred for boiling.

TO BOIL A LEG OF MUTTON WITH TURNIP, &c.

A leg of mutton—the gigot of the French and Scottish kitchen—may be kept from two days to a week before boiling. The pipe, as it is technically called, must be cut out, and the moistness which gathers on the surface, and the folds and soft places rubbed off occasionally. It is whitest when quite fresh, but most delicate when hung a few days in the larder, though not so long as to allow the juices to thicken, and the flavour to deteriorate. Hill wether mutton from four to seven years old is far the best, whether for boiling or roasting. Choose it short in the shank, thick in the thigh, and of a pure, healthy brownish red. Chop but a very small bit off the shank; if too much is taken off, the juices will be drained by this conduit in the boiling. If you wish to whiten the meat, blanch it for ten minutes in warm water. Boil in an oval-shaped or roomy kettle, letting the water come very slowly to boil. Skim carefully. Boil carrots and turnip with the mutton, and the younger and more juicy they

are the better they suit this joint. Be sure never to run a fork or any thing sharp into the meat, which would drain its juices. All meat ought to be well done, but a leg of mutton rather under than over, to look plump and retain its juices. About two hours of slow boiling will dress it. Garnish with slices of carrot. Pour caper-sauce over the meat, and serve washed turnip or cauliflower in a separate dish. To make the caper-sauce, take two table spoonfuls of capers and a little vinegar. Mince the one-half and stew the whole of them into a half-pint of melted butter, or of strong thickened gravy. To prevent the butter from oiling, stew the sauce for some time.

TO BOIL POULTRY.

Be careful, in picking, not to break the skin. Let the fowls hang from two to five days; for the most delicate fowl will be tough and thready if too soon dressed. When to be used, draw, singe without blackening, and wash thoroughly, passing a stream of water again and again through the inside. Boiled fowls must be very neatly trussed, as they have small and firm sinews. Put them on with plenty of water, a little warmed. Having, as usual, skimmed very carefully, simmer by the side of the fire from twenty-five minutes to an hour, according to the age and size of the fowl.

TO BROIL BEEF STEAKS.

In England, the best steaks are cut from the middle of the rump. In Ireland, Scotland, and France, steaks which are thought more delicate are often cut, like chops, from the sirloin or spare rib, trimming off the superfluous fat, and chopping away the bone. This is the piece of meat usually cut into steaks in the shops of Edinburgh and Glasgow, rump beef being used for minced collops, sausages, &c. Beef for steaks must be killed for from three to five days, or more, to act tender, but it does not require to be kept so long as a large piece to be roasted. Cut the steaks of equal thickness (about three quarters of an inch); beat them out to a level, though much beating is not recommended, as it expresses the juices from the meat. Let them be from three to four inches in breadth, and from four to six in length. Sirloin steaks shape themselves. When the gridiron is hot, rub the bars with suet, sprinkle a little salt over the fire [which ought to be very clear], and lay on the steaks. Turn them frequently, to do them equally and keep in the juices. When the fat blazes and smokes very much, quickly remove the gridiron for a second, till the blaze is past. From ten to twelve minutes will do a steak. Have a hot dish, rubbed with eschalot, placed by the side or over the fire, on the edge of the gridiron. When turning the steaks, if there be on the top any gravy that would fall on turning, drop it quickly into this dish to preserve it. Steaks are generally preferred underdone. Sprinkle them with a little salt just before they are dished in the hot dish. Turn the steaks over once or twice in the dish to express the gravy. Those who enjoy a well-dressed beef-steak discard all sauces save the native juice of the meat.—Beef-steaks ought not to be prepared till the moment they are to be eaten.

MOCK TURTLE SOUP.

Procure the head of a middle-sized well fed cow calf, with the skin on; scale it; split and take out the brains and the gristles and bones of the nose; blanch it well in several waters, to draw out the slime and blood. Place it in a stew-pan, and cover it with cold water; boil it, and skim without intermission while any scum continues to rise. When the head has boiled gently for three quarters of an hour, take it out, and, as soon as cold enough to cut, carve it into small neat pieces, in the shape of diamonds, dice, triangles, &c. Peel the tongue, and cut it into cubes of an inch thick. Meanwhile, put the broken bones and trimmings of the head into your stock-pot, with a large knuckle of veal well broken, and three or four pounds of a shin of beef well soaked. Let this boil very slowly, having carefully skimmed it, for at least four hours, and take care it does not stick to the bottom of the pot; then strain for future use, and lay aside a quart of this stock for gravy. Thus much may be done the evening before the soup is wanted. When the soup is to be made, take off the cake of fat which will be formed on the top, and put the stock, holding back the sediment, into a large stew-pan. If the stock is good it will be a jelly, or nearly so. When it is again skimmed, put to it a dozen onions sliced, and browned in the frying pan, with a half-dozen sprigs of fresh mild sage, also chopped and fried. Thicken the soup with butter kneaded in browned flour; and season highly with ground black and Jamaica pepper, a little cayenne, two blades of mace, an eschalot, four leaves of fresh basil, and the parings of one large and two small lemons. When the soup is strong and well coloured, strain it through a hair sieve very gently into a fresh stew-pan, and put the hash of the head to it. Add wine when it is nearly finished in the proportion of a half glassful to the quart. Madeira or sherry are the wines commonly employed. When to be dished, slip in two dozen of small force-meat balls, made of veal or veal kidney, minced parsley and crumbs; also hard boiled yolks of eggs, or egg balls, and the juice of two lemons squeezed through a strainer.

TO FRY HADDUCKS AND OTHER FISH.

The following is an excellent mode of preparing fish. Clean and skin the haddocks. If they be too large, cut them in two or three pieces, or split them, or slit the backs. When the fish are dried, rub them with flour, and, if to be higher dressed, rub off the flour, and with a paste-brush wash them over with beat egg; stew finely grated crumbs over them, and fry in a deep pan in plenty of clarified dripping or lard, heated to such a degree that it may neither scorch the fish, nor yet stew them. Turn and lift them carefully, and keep them hot by the fire, on a sieve and paper, to absorb the fat, till the whole are finished. The bone may be cut out, particularly in large fish. [I think it is always an improvement.] The same fat will fry more than once, if strained.

EDINBURGH: Published by WILLIAM and ROBERT CHAMBERS, Booksellers, No. 19, Waterloo Place. Sold also by JAMES CHAMBERS, 48, North Hanover Street, and by all other Booksellers in Edinburgh and every other Town in Scotland.

Subscribers in Town may have the Paper left at their houses every Saturday morning, by giving their addresses at 19, Waterloo Place. Price of a quarter of twelve weeks, 1s. 6d.; of a half year of twenty-four weeks, 3s.; and of a year, 6s. 6d. In every case payable in advance.

In LONDON, an Edition is published, with the permission of the Proprietors, by W. S. ORN, Paternoster-row, for circulation throughout England, Wales, and Ireland.

FALLACIES OF THE YOUNG.

"DEBTORS AND CREDITORS."

THE common feeling respecting debtors and creditors is very erroneous, and, as is common with popular fallacies, it imposes with double force upon the young and inexperienced. Debtors are represented in all works of fiction, and in the ordinary language of a large portion of society, as a set of amiable, unfortunate, and most interesting persons: Creditors, on the other hand, as an unmingled generation of execrable wretches, with a hardness of heart that would not disgrace the executioner, and indeed only one remove from another stony class of men, the much misrepresented jailors. Now, the person who writes this article has known many debtors and creditors, and he can say that, in by far the most cases, the latter were the better class of men. He alludes, of course, not to commercial men at large, who are in their own persons, in general, as much of the one thing as the other, but to cases where the creditor is a tradesman, and the debtor a customer; that is, where the debt is not incurred in the intercourse of business, but for the personal use and benefit of the debtor. In these cases, so far from the creditor being an unfeeling and relentless tyrant, as he is generally represented, he is only the indignant victim of the imprudence or guilt of the debtor. The latter may be an amiable and interesting person, for we often find these characteristics united to consummate folly and disregard of the rights of others. But the young must beware how they set down debtors, in a class, as purely estimable and entitled to sympathy, while they at the same time look upon creditors as only ruthless persecutors, worthy of the bitterest execration. They may depend upon it that no notion could be more erroneous, no error more apt to be fatal to them in their course through life. They must be informed that to incur debt for their own gratifications, without the ability to discharge it, is just another thing for selling themselves as slaves to their creditors. After doing so, they are no longer entirely free: part of themselves becomes the property of another, and thus they lose the respect of the world, which cannot see one man indulge in enjoyments at the expense of his fellow, without thinking of him very meanly. The incurring of debt for personal gratification is odious, for many reasons. In the first place, it violates that rule of nature which appoints every man to work for himself, and only enjoy as he works. It also tends to occasion the ruin of innocent persons. Creditors are not invariably rich, as one would suppose them to be, from reading novels. They are more frequently poor, industrious persons, who, in losing money by their debtors, are apt to be made debtors themselves, and thereby ruined. In fact, the case stands generally thus:—An idle or extravagant person procures support for his bad appetites, and is enabled to show himself off as a very fine fellow, at the expense of a humble-minded honest trader, who confines himself constantly to his business, and forbids himself almost every indulgence, in order that he may be able to pay every one to whom he is indebted, and discharge all the other duties of a good citizen. Now, if young people will bring their naturally generous feelings to bear upon this point, they will see that the debtor, and not the creditor, is alone worthy of execration. And they may be assured that where creditors show a severity to their debtors, it is generally either merited by the latter, or is dictated by a justifiable consideration of the danger into which they are thrown by the non-payment of the money which is their due, and which they may be owing in their turn to some other person.

In every rule there are exceptions; but it is necessary to guard against the breaking down of *great rules* by allowing for *trifling exceptions*. Because good men sometimes incur debt, and become insolvent, through no fault of theirs, we must not infringe upon the majesty of the great maxim, that debt ought to be paid, and that its non-payment is an evil. Young people, if they wish to prosper in the world, will do well not to excuse all contraction of debt for the sake of the few who contract it innocently. They must have impressed forcibly upon their minds, that every pleasure in which they indulge themselves, without the reasonable prospect of paying for it, though it be but to the amount of one penny, is a step in error, and apt to be the beginning of their destruction. They must have it impressed upon their minds that no man of good feelings can enjoy the least comfort, if he be not conscious of working for, or being honestly come into the possession of, fully as much as he spends. To persist in living beyond our incomes is to live a life of dishonesty and to subsist on the industry of relatives, as is sometimes the case with the idle and the dissolute, is worse still, for it involves an excessive meanness of spirit, ingratitude, and hard-heartedness—thus adding depth to the crime, and will be sure to be visited some day with feelings of anguish and remorse.

A predominating error among the junior classes of society, is a disinclination to wait for a short time till they be enabled to compete in the enjoyment of luxuries with others they see around them, and who it is more than probable have toiled long and painfully before they arrived at their present apparently prosperous condition. This impatience of reaching a certain height in the ladder of fortune, without taking deliberation to mount a number of preliminary and difficult steps, cannot, indeed, be sufficiently reprehended where it occurs, as it leads to that fatal resource of incurring debts never to be paid, and that supposed harshness of creditors, which a disordered process of reasoning brings into view. I would here tenderly admonish the youthful part of the community to refrain from indulgences they cannot honestly command. Let them believe one who has had some experience, when he tells them that there is not the least chance of the world running away from them; that the present generation of grown men will not consume all earthly enjoyments, but will leave a boundless variety of every thing which can please the senses, or gratify an honourable ambition. They need, therefore, be in no hurry whatever, and take time to build their fortune on a firm and secure basis. The rising generation cannot lay these things sufficiently to heart. They cannot be sufficiently taught, that suffering under the consequences of imprudently incurred debts does not necessarily make them heroes—is not entitled to unmingled sympathy, no more than a robber at the gallows is a martyr; but that, while pity is perhaps due to them, as to all who err in this frail world, the larger share of sympathy ought to be bestowed on their unfortunate victims, the creditors, whose families may be suffering from their criminal follies, and who are apt to be by far the better and honestest men.

FORMATION OF SCOTTISH SOCIETY.

Continued.

Few of the ancient families of Scotland can trace their genealogy to so distinguished a foreign source as that of Vans, or more properly Vaux, or Vaux. On the Continent of Europe the De Vaux family have been Dukes of Andrea, Princes of Joinville, Taranto,

and Altamara, Sovereign Counts of Orange and Provence, and Kings of Vienne, and Arles, as well as Lords de Vaux in Normandy. Members of the Norman branch of the family accompanied the conqueror to England in 1066, and there their descendants became Lords de Vaux, of Pentney and Beever in Norfolk, of Gilsland in Cumberland, and of Harrowden in Northamptonshire. It is mentioned by Sir David Lindsay, in his Heraldry, that Vaux was "one of the surnames of thame that came furth of Ingland with Sanct Margaret," the wife of Malcolm Canmore. According to Sir James Dalrymple, one of the family came to Scotland in the reign of David I.; and in the reign of his grandson and successor Malcolm IV., mention is made of Philip de Vallibus or Vaux, who had possessions in the south, and soon after the family is found proprietors of the lands and barony of Dirlerton, in East Lothian. The chief remaining branch of this ancient house has long been that of the Vanses of Barnbarroch in Wigtownshire. The change of the name from Vaux to Vans, though curious, is not singular, as many Scottish surnames have been gradually altered in a similar manner, chiefly from a peculiarity in writing them down.

The noble family of Loudon in Ayrshire originated in James the son of Lambin, who obtained from Richard de Morville the manor of Loudon, in Cunningham. Here he settled as the vassal of Moreville, and assumed the designation De Loudon, according to the practice of the age. The estate and name merged, by the marriage of a female heir, into the Crawford of Lanarkshire. The Vetrepointes, an Anglo-Norman family, settled in Scotland in these early times; but though they extended themselves over the country, they did not arrive at any eminence, and have bequeathed no surname. The distinguished name of the Frasers first made their appearance in Scotland about the reign of David I., their earliest place of settlement being in East Lothian, where they held lands as vassals of the Earls of Dunbar. From these Frasers were descended families of the same name, who acted a conspicuous part in the troublous period consequent on the death of Alexander III. Symon Fraser, a descendant, became possessor of extensive estates in Peebles-shire, and has been famed as one of the most gallant soldiers during the struggle which the Scotch maintained against Edward I. In time, the Frasers of East Lothian and Peebles-shire sunk through female heirs, or transferred themselves to the north, where they have ever since been found. During the reign of Robert Bruce, they proceeded northward into the Mearns, Aberdeenshire, and Inverness-shire, and from this stock branched off Fraser Lord Salton, Fraser Lord Fraser, and Fraser Lord Lovat.

The Cummings, or Cumyns, were also settlers in Scotland under David I., having come from the county of Northumberland. From Earl Henry, the son of David, Richard Cumyn received a grant of the estate of Linton Roderick in Roxburghshire, which was thus their first place of settlement. The Cumyns, like the Frasers, spread northward; one became Lord of Badenoch, and another, by marriage, Earl of Monteith. The name of Cumyn figures conspicuously throughout the disastrous period of the thirteenth century. Their ambition led them to put forth their claims to the Scottish crown, but they at length fell before the fortune of Bruce, and their surname has never since emerged from obscurity. Connected with these eminent persons, was another great family of Norman origin, the Baliols of Bernard Castle, in Durham, who obtained some lands in Scotland under David I. They became conspicuous under William

the Lion, and his son Alexander II. In 1233, John Balliol of Bernard Castle married Devorgoil, the youngest daughter of Allan, the lord of Galloway, by his second wife, Margaret, the daughter of David the Earl of Huntingdon. By this marriage he obtained, on the death of Allan, vast opulence; and on the demise of Alexander III. his family was involved in lasting misery. His son, John Balliol, it will be remembered, obtained the crown through his mother, his grandmother, and great-grandfather; had his claims allowed by Edward, and, after a bloody struggle, died in France in 1316. The various families of Balliols in Scotland seem to have become extinct after these disasters. The family which now falls naturally under notice is that of Bruce. Robert de Bruis was an opulent baron in Yorkshire, at the early epoch of Domesday Book. His son Robert appeared in the court of Henry I. with Earl David, being nearly of the same age; and soon after the accession of King David in 1124, he obtained from him a grant of the district of Annandale. The charter by which David conferred this large domain is of a curious nature. It establishes the tenure by the sword; that is, gives a right to Bruce to take possession and retain by force of arms. It may thus be supposed that the English baron, in thus making good his settlement, would bring with him knights and yeomen from Yorkshire, as indeed might be shown by tracing to this source some respectable families—the Johnstons, for one, in Dumfriesshire. The baron, who in this manner acquired the district of Annandale, died in 1141; his son Adam inheriting his English estates, and becoming the progenitor of the Bruces of Skelton, and his youngest son Robert inheriting the property in Scotland, and laying the foundation of the royal house of Bruce in this kingdom. Robert, his grandson, married Isabel, the second daughter of David, the Earl of Huntingdon; and it was in consequence of this marriage that their son Robert entered into the competition for the crown, and that their great-grandson ascended the throne. In the genealogy of these Bruces, it appears that there had been nine persons in direct descent from Robert Bruis of Domesday Book, to Robert Bruce the restorer of the Scottish monarchy, inclusive, and that there were eight of them named Robert, and one of them called William.

This superficial sketch may here be closed by some account of the not less distinguished family of Stewart. During the troublous conflicts of Maud and Stephen, in their competition for the crown of England, Walter, the son of Allan, the son of Flaald, fled from the family-seat at Oswestry, in Shropshire, and settled in Scotland. David I. made him his steward, and gave him lands to support the dignity of his office. By the charter we learn that these lands were those of "Passaleth (Paisley), Polloc, Talahae, Ketkert, le Drop, le Mutrene, Eglesham, Louchwinnock, and Inverwick." These estates in Renfrewshire (then a portion of Lanarkshire) were confirmed by Malcolm IV. in 1157, when he made the office of steward hereditary, and granted, in addition, various other estates in the same quarter. Besides these possessions, Walter acquired the western half of Kyle in Ayrshire, which hence was called Kyle Stewart. At this period the country was in a semi-barbarous state; but Walter the Stewart introduced new and civilised usages. He settled many of his military followers on his lands, and, founding the Abbey of Paisley, introduced a body of instructed men, who taught the ancient people domestic arts and foreign manners. By the marriage of one of these Stewarts with Margery Bruce, Robert the Stewart was born, and became King of Scots, 1370-1. We thus perceive that the Cumyns, the Balliols, the Bruces, the Stewarts, all claimants or inheritors of the Scottish crown, were the descendants of Englishmen, who at the distance of a very few generations had had no connexion whatever with Scotland. A fact still more curious may be mentioned. The illustrious family of Wallace was of the same recent English extraction. The first of the name, which appears to have been variously written Walense, or Waleys, was an Anglo-Norman, who settled under the Stewarts in Ayrshire and Renfrew. Richard Walense acquired lands in Kyle, where he settled, and named the place Ricard-tun, which till this day is the name of a village and parochial division. Another branch of the family of Walense took root in Renfrewshire under Walter the Stewart, in the early part of the thirteenth century; and from this branch was descended Sir William Wallace of Ellerslie. In this manner, the great-grandfather of this distinguished Scottish patriot must have been an Englishman by birth.—*To be continued.*

EUROPE EMERGING FROM THE MIDDLE AGES.

THE least interesting period in the history of mankind occurs from the fourth till the twelfth centuries, a period entitled by historians "the middle ages," from the circumstance of its being preceded by the enlightened epoch of Roman history, and succeeded by the revival of arts and learning consequent on the crusades. The overthrow of the empire of Rome was begun to be effected by the warlike inroads of barbarous tribes in the course of the fourth century, and it was two hundred years before Europe recovered tranquillity under an entirely new system of government. The Saxons were by that time masters of the southern and more fertile provinces of

Britain; the Franks, of Gaul; the Huns, of Pannonia; the Goths, of Spain; the Goths and Lombards, of Italy and the adjacent provinces. Very faint vestiges of the Roman policy, jurisprudence, arts, or literature, remained. New forms of government, new laws, new manners, new dresses, new languages, and new names of men and countries, were introduced. The magnificence of Rome was followed by the rudeness of savage races of men, whose temper long kept Christendom in a state of mental darkness. In these middle ages arose the feudal system—a plan of holding land by military service, and of introducing a perfect principle of vassalage, from the lowest serf up to the sovereign or conqueror. During this dark epoch, the great dominant power was the Church of Rome, and in whose clergy a knowledge of letters alone found a refuge.

The disorders in the feudal system, together with the corruption of taste and manners consequent upon these, which had gone on increasing during a long course of years, seemed to have attained their utmost point of excess towards the close of the eleventh century. From that era we may date the return of government and manners in a contrary direction, and can trace a succession of causes and events which contributed, some with a nearer and more conspicuous, others with a more remote and less perceptible influence, to abolish confusion and barbarism, and to introduce order, regularity, and refinement. The crusades, or expeditions in order to rescue the Holy Land out of the hands of infidels, seem to be the first event that roused Europe from the lethargy in which it had been long sunk, and that tended to introduce any considerable change in government or in manners. It is natural to the human mind to view those places which have been distinguished by being the residence of any illustrious personage, or the scene of any great transaction, with some degree of delight and veneration. To this principle must be ascribed the superstitious devotion with which Christians, from the earliest ages of the church, were accustomed to visit that country which the Almighty had selected as the inheritance of his favourite people, and in which the Son of God had accomplished the redemption of mankind. As this distant pilgrimage could not be performed without considerable expense, fatigue, and danger, it appeared the more meritorious, and came to be considered as an expiation for almost every crime. An opinion which spread with rapidity over Europe about the close of the tenth and beginning of the eleventh century, and which gained universal credit, wonderfully augmented the number of credulous pilgrims, and increased the ardour with which they undertook this useless voyage. The thousand years, mentioned by St John in the second and third verses of the twentieth chapter of Revelations, wherein it is told that the devil was to be loosed after having been bound for that period of time, were supposed to be accomplished, and the end of the world to be at hand. A general consternation seized mankind; many relinquished their possessions, and, abandoning their friends and families, hurried with precipitation to the Holy Land, where they imagined that Christ would quickly appear to judge the world.

When the minds of men were thus prepared, the zeal of a fanatical monk, who conceived the idea of leading all the forces of Christendom against the Mahomedans who held possession of the Holy Land, and of driving them out by violence, was sufficient to give a beginning to that wild enterprise. *Peter the Hermit*, for that was the name of this martial apostle, ran from province to province with a crucifix in his hand, exciting princes and people to this holy war, and, wherever he came, kindled the same enthusiastic ardour for it with which he himself was actuated. The council of Placentia, where upwards of thirty thousand persons were assembled, pronounced the scheme to have been suggested by the immediate inspiration of Heaven. In the council of Clermont, still more numerous, as soon as the measure was proposed, all cried out with one voice, "It is the will of God." Persons of all ranks caught the contagion: not only the gallant nobles of that age, with their martial followers, whom we may suppose apt to be allured by the boldness of a romantic enterprise, but men in the more humble and pacific stations of life; ecclesiastics of every order, and even women and children, engaged with emulation in an undertaking which was deemed sacred and meritorious. It is related that no less than six millions of persons assumed the cross, which was the badge that distinguished such as devoted themselves to this holy warfare. All Europe, torn up from the foundation, seemed ready to precipitate itself in one united body upon Asia. Nor did the fumes of this enthusiastic zeal evaporate at once; the frenzy was as lasting as it was extravagant. During two centuries, Europe seems to have had no object but to recover, or keep possession of, the Holy Land; and through that period vast armies continued to march thither.

The first efforts of valour, animated by enthusiasm, were irresistible. Part of the Lesser Asia, all Syria and Palestine, were wrested from the infidels; the banner of the cross was displayed on Mount Zion. Constantinople, the capital of the Christian empire in the east, was afterwards seized by a body of those adventurers who had taken arms against the Mahomedans; and an Earl of Flanders and his descendants kept possession of the imperial throne during half a century. But, though the first impression of the crusaders was so unexpected that they made their conquests with great ease, they found infinite difficulty in preserving them. Establishments so distant from Europe, surrounded by warlike nations animated with fanatical zeal scarcely inferior to that of the crusaders themselves, were perpetually in danger of being overturned. Before the expiration of the thirteenth century (1294), the Christians were driven out of all their Asiatic possessions, in acquiring of which incredible numbers of men had perished, and immense sums of money had been wasted.

But from these expeditions, extravagant as they were, beneficial consequences followed, which had neither been

foreseen nor expected. In their progress towards the Holy Land, the followers of the cross marched through countries better cultivated and more civilized than their own. Their first rendezvous was commonly at Italy, in which Venice, Genoa, Pisa, and other cities, had begun to apply themselves to commerce, and had made considerable advances towards wealth as well as refinement. They embarked there, and, landing in Dalmatia, pursued their route by land to Constantinople. Though the military spirit had been long extinct in the Eastern Empire, and a despotism of the worst species had annihilated almost every public virtue, yet Constantinople, having never felt the destructive rage of the barbarous nations, was the greatest as well as the most beautiful city in Europe, and the only one in which there remained any image of the ancient elegance in manners and arts. The naval power of the Eastern Empire was considerable. Manufactures of the most curious fabric were carried on in its dominions. Constantinople was the chief mart in Europe for the commodities of the East Indies. It was not possible for the crusaders to travel through so many countries, and to behold the various customs and institutions, without acquiring information and improvement. Their views enlarged, their prejudices wore off, new ones crowded upon their minds; and they must have been sensible on many occasions of the rusticity of their own manners, when compared with those of a more polished people. These impressions were not so slight as to be effaced upon their return to their native countries. A close intercourse subsisted between the east and west during two centuries; new armies were continually marching from Europe to Asia, while former adventurers returned home, and imported many of the customs to which they had been familiarised by a long residence abroad. Accordingly we discover, soon after the commencement of the crusades, great splendour in the courts of princes, great pomp in public ceremonies, a more refined taste in pleasures and amusements, together with a more romantic spirit of enterprise spreading gradually over Europe; and to these wild expeditions, the effect of superstition or folly, we owe the first gleams of light which tended to dispel barbarism and ignorance.

The crusades were in a particular manner beneficial to the Italian states. The Venetians made themselves masters of part of the ancient Peloponnesus in Greece, together with some of the most fertile islands in the Archipelago. Many valuable branches of commerce, which formerly centred in Constantinople, were transferred to Venice, Genoa, or Pisa. Thus a succession of events, occasioned by the Holy War, opened various sources, from which wealth flowed in such abundance into these cities, as enabled them, in concurrence with another institution, immediately to be mentioned, to secure their own liberty and independence.

The institution here alluded to was the forming of cities into communities, corporations, or bodies politic, and granting them the privilege of municipal jurisdiction, which contributed more, perhaps, than any other cause, to introduce regular government, police, and arts, and to diffuse them over Europe. The feudal government had degenerated into a system of oppression. The usurpations of the nobles were become unbounded and intolerable; they had reduced the great body of the people into a state of actual servitude. Nor was such oppression the portion of those alone who dwelt in the country, and were employed in cultivating the estate of their master. Cities and villages found it necessary to hold of some great lord, on whom they might depend for protection, and became no less subject to his arbitrary jurisdiction. The inhabitants were deprived of those rights which, in social life, are deemed most natural and inalienable. They could not dispose of the effects which their own industry had acquired, either by a latter will, or by any deed executed during their life. Neither could they marry, or carry on law-suits, without the consent of their lord. But as soon as the cities of Italy began to turn their attention towards commerce, and to conceive some idea of the advantages which they might derive from it, they became impatient to shake off the yoke of their insolent lords, and to establish among themselves such a free and equal government as would render property secure, and industry flourishing. Encouraged by their distance from the seat of government of the German emperors, and other circumstances, the inhabitants of some of the Italian cities, towards the beginning of the eleventh century, began to assume new privileges, to unite more closely, and to form themselves into bodies politic under the government of laws established by common consent. The rights which many cities acquired by bold or fortunate usurpations, others purchased from the emperors. The increase of wealth which the crusaders brought into Italy occasioned a new kind of fermentation and activity in the minds of the people, and excited such a general passion for liberty and independence, that, before the conclusion of the last crusade, all the considerable cities in that country had either purchased, or had extorted large immunities from the emperors.

This innovation was not long known in Italy before it made its way into France. Charters of community were granted, enfranchising the inhabitants of towns, abolishing all works of servitude, and forming them into corporations or bodies politic, to be governed by a council and magistrates of their own nomination. Much about the same period the great cities in Germany began to acquire like immunities, and laid the foundation of their present liberty and independence. The practice spread quickly over Europe, and was adopted in Spain, England, Scotland, and all other feudal kingdoms. The first community of this description formed in Scotland is understood to have been that of Berwick-upon-Tweed, which received its charter from William the Lion. Towns, upon acquiring the right of community, became so many little republics, governed by known and equal laws. The inhabitants being trained to arms, and being surrounded by walls, they soon began to hold the neigh-

bouring barons in contempt, and to withstand aggressions on their property and privileges. The monarchs of Europe, in general, thus found these burghal communities of great service in opposing the overgrown power of the nobility, and, consequently, continued to load them with additional immunities. But another great good, of fully more importance, was produced. These free communities were speedily admitted, by their representatives, into the great council of the nation, whether distinguished by the name of a Parliament, a Diet, the Cortes, or the States-General. This is justly esteemed the greatest event in the history of mankind in modern times. Representatives from the English boroughs were first admitted into the great national council by the barons who took up arms against Henry III. in the year 1265; being summoned in order to add to the greater popularity of their party, and to strengthen the barrier against the encroachments of regal power. I notice this circumstance merely as a matter of history, and leave my readers to draw their own conclusions from an event which ultimately had the effect of revolutionizing the whole framework of society, and of rearing that great respectable body of the people styled "the middle classes."

The enfranchising of burghal communities led to the manumission of slaves. Hitherto the tillers of the ground, all the inferior classes of the country, were the bondmen of the barons. The monarchs of France, in order to reduce the power of the nobles, set the example, by ordering (1315-18) all serfs to be set at liberty on just and reasonable conditions. The edicts were carried into immediate execution within the royal domain. The example of their sovereigns, together with the expectation of considerable sums which they might raise by this expedient, led many of the nobles to set their dependents at liberty; and servitude was gradually abolished in almost every province of the kingdom. This beneficial practice similarly spread over the rest of Europe; and in England, as the spirit of liberty gained ground, the very name and idea of personal servitude, without any formal interposition of the legislature to prohibit it, was totally banished.*

THE STRANGER GUEST.

AN ENGLISH TALE.

THERE was in my neighbourhood a farm-house which was remarkable, as well for the peculiarity of its structure, as the very beautiful country by which it was surrounded. It was very ancient, and had the appearance of being of Saxon architecture. The farm attached to it was of considerable extent, and formed part of the estate of a nobleman who had large possessions in the country, but who rarely visited them. As a young man, he was conspicuous for the generosity of his disposition, a nice sense of honour, and the mildness and affability of his manners. His classical and intellectual attainments were of a high order; and his wit, like Yorick's, was wont to "set the table in a roar." He formed an attachment to a young lady, who, in a month before the day fixed for their union, suddenly, and without assigning a reason for the alteration in her sentiments, married a nobleman of higher rank. He received the intelligence of her faithlessness without uttering a syllable, or betraying any indication of anger or sorrow; nor was he ever known to allude to the subject—but, from that hour, he was a changed man. He withdrew entirely from female society, and became a member of a fashionable club, where a great portion of his time was passed. He engaged for a season in play; but, although his losses were insignificant, he soon grew disgusted with his pursuit and his companions. He then plunged deeply into politics, and was constant in his attendance at the House; but the vacuum in his mind was too vast to be filled by such expedients. He then quitted England, and travelled rapidly through France, Italy, and Germany, but could not outstrip the phantom that pursued him. At length he took up his residence entirely on the Continent, and thus his talents were lost to his country, whose senate he had so often charmed by his eloquence, and enlightened by his wisdom.

The management of his estates, in the meantime, was confided to his steward, Mr Giles Jenkins; a man who, although he would have made a grenadier among Lilliputians, was but a Lilliputian among grenadiers, being in stature exactly five feet two inches. His sallow complexion and forbidding aspect were by no means improved by an obliquity of vision and a red nose, which latter decoration was obtained at the expense of his temperance. He had been originally bred to the law, to the tortuosities of which his mind was admirably adapted. Diminutive as was his person, there was room enough in his bosom for the operation of some of the fiercest passions that deform humanity. His indomitable arrogance, grasping avarice, and insatiable revenge, made him the terror of all who were subjected to his influence, particularly of the tenants, among whom he exercised the most tyrannical sway. He was, moreover, a consummate hypocrite, and, as far as regarded his master, a successful one.

The farm at the period of which I am writing was tenanted by Andrew Hodson, whose ancestors had cultivated the same soil for more than a century.

Andrew had passed his fiftieth year; but the temperance of his habits, and the healthful nature of his employment, had protected him, in a great degree, from the inroads of time, and gave him the appearance of being much younger. His complexion exhibited the ruddy hue of health; and, although naturally fair, was imbrowned by the sun of many summers.

Andrew's wife, who had been pretty, and was then a very comely dame, was somewhat younger than himself. Her domestic virtues and acquirements were admirably adapted for a farmer's wife; and, although a shrewd, she was a very kind-hearted woman. They had

two children, a son and a daughter; the former about one and twenty, and the latter two years younger.

Frank Hodson, very like his father in person, was an industrious, good humoured lad; and, when dressed in a smart green riding frock, light corduroy breeches, and long leather gaiters, or leggings, as they are called, was a very likely object to draw a second look from the village maidens, or even from dames of higher degree, as, mounted on his rough-coated forester, he passed on his way to the market town.

Those who, in their estimate of a rustic belle, are unable to separate the idea of vulgarity from the character, would do gross injustice to Amy Hodson, both as regards the style of her beauty, and the gentleness of manner by which it was graced. Nature is no respecter of persons; and in the formation of our race, has little reference to the stations we are destined to fill; since she as often bestows the fair heritage of beauty on the child of a peasant as on the heiress of a peer. Nor am I aware of any thing in the habits or occupation of a farmer's daughter, which has not a tendency rather to improve than to impair the symmetry of the form. Amy rose with the lark, breathing as sweet a hymn to the portals of heaven, and returning the first glance of Aurora with an eye as bright, and a smile as rosy as her own. Nor is Nature always aristocratic in dispensing understanding, and Amy's was an excellent one, on which the few advantages she had derived in point of education had not been thrown away.

The family, parents, and children, were bound together, not only by links of the strongest affection, but by the firmer bands of religion, of which they had all a deep and influential sense. The voice of contention was never heard in their dwelling.

Andrew Hodson for many years had prospered in the world, but on the expiration of the lease which had descended to him from his father, a reluctance to quit a spot which so many recollections had endeared to him, induced him to take the farm, at a rent above its value; so that, instead of saving money every year as he was wont to do, he began to find it a losing concern. At length, however, the failure of a provincial banker deprived him of the hundreds he had laid by, and placed him in circumstances of much difficulty. Thus it happened, that in lieu of having his homestead surrounded by wheat-stacks, the growth of former years, his sheaves were transferred directly from the harvest-field to the thrashing-floor, and the produce was sent to market under all the disadvantages of a forced sale, to meet his Michaelmas rent. Again, if a horse died, or was worn out, he was unable, for want of money, to supply its place; and thus the strength on his farm became gradually so much reduced, that many acres of his land, which might have been made productive, remained uncultivated.

Andrew and his family met his reverse of fortune as became them, by the sacrifice of very many comforts, in which, under more prosperous circumstances, they were warranted in indulging. The old man exchanged his favourite hackney for a cart-horse, and superintended the operations on his farm on foot. Frank gave up his forest galloway to the harrow and light plough; and poor Amy's pony was sold to a gentleman in the neighbourhood, who had taken a fancy to it for his daughter. The privation, however, which they most lamented, was the necessity of contracting, not only the scale of their hospitality, but the sphere of their charity. It is true, the wayfarer man never passed the door unrefreshed, nor the houseless wanderer unrelieved; and their hearth still shed its genial warmth upon the poor dependent, whom they had not the heart to displace from his seat in the chimney corner; but there were many who were left bitterly to regret that the liberal hand should ever be closed by the pressure of calamity.

Under the influence of all these inauspicious events, they had sources of comfort of which the world could not deprive them. The sound of the dance, and the voice of innocent hilarity, were no longer heard in their hall, but the still small voice of an approving conscience consoled them for the loss. Where a family are thus united, their home, although it were a hovel, cannot be desolate. Instead of sitting down in despair under their misfortune, each strove to cheer and support the other beneath its weight. They had all been early taught to look up to their God, and to put their trust in His mercy and wisdom under every dispensation; nor, at the morning and evening sacrifice, were their hearts less fervent in their thanksgivings for the blessings which were left to them, than when they were showered down with a profuser hand. Another source of consolation was supplied to them in the uniform respect of those around them, who regarded their calamity with that silent sympathy which is worth all the condolence that proud prosperity ever dinged into the ears of the unfortunate. Often would the neighbouring farmers, aware of the difficulties he laboured under for want of strength upon his land, club together, each contributing a horse, and thus furnish him with the use of a team for several days, in the busy seasons of seed-time and harvest.

One evening towards the close of the summer, as Andrew Hodson and his family were sitting at the window, they observed a horseman riding along the road, which lay within a few yards of the house. Frank, whose admiration of a fine horse was in no degree diminished by the circumstance of his no longer possessing one, exclaimed to his sister, "Look, Amy! is not that a fine creature? what action he has! and see how he throws his feet out; a little ewe-necked, to be sure, but that is a sign of blood."

In the meantime, the traveller had arrived nearly opposite to the house. He was rather tall, somewhat in years, but sat very erect on his horse, whose appearance justified the encomiums which Frank had bestowed on it. The gentleman's dress consisted of a blue coat, not remarkable for its lustre, and of a fashion almost coeval with the wearer; it was buttoned close up to his throat. His legs were encased in riding boots, and his intermediate habiliment was of buckskin, which however did

not fit its present proprietor quite so tightly at it did its deceased one.

"I wish, Frank," said the farmer, "you would keep that dog tied up," alluding to a small terrier which ran out at the gate, and barked at the heels of the traveller's horse. The animal reared in consequence, and then, in plunging, one of its feet alighted on a rolling stone; it stumbled and fell, throwing its rider to the ground with considerable violence. The steed was soon on its legs again; its master rose more slowly, approached his horse, passed his hand over its knees, and then attempted to remount, but in vain, and he was compelled to lean against the saddle for support.

By this time all the family were at his side, expressing much regret for the occasion of the accident, and apprehensions for the consequences. The stranger was with difficulty conducted into the house, and placed upon a sort of couch, where he remained for some minutes, without uttering a word, although his countenance was sufficiently indicative of his feelings, in which vexation appeared to predominate over pain. On his making a movement, which those around him interpreted into an attempt to rise, he was earnestly entreated not to think of quitting the house until the following day. He replied, in no very conciliatory tone: "No, no, you have me safe enough; I shall be your guest for some time to come, to my comfort, and no doubt to yours; and if that abominable cur be not hanged or shot, I think your house stands a fair chance of becoming an hospital." Frank expressed himself deeply concerned for the accident, but alleged that the dog had been tied up, and had broken its chain; he added, however, that the animal should not commit a similar offence, and, taking a gun from over the chimney-piece, declared his intention of destroying the culprit immediately. "I pray you, young gentleman, forbear," said the stranger; "what warrant have I that the animal is not mad? He may have bitten my horse, and my horse may go mad also and bite me. No, no, sir, tie the brute up again, securely, if you please, and 'when he foams at the mouth,' you may shoot him and the horse together." Perceiving that the gentleman was in great pain, the farmer inquired if he would prefer being conducted to bed to remaining on the couch. He replied, "Yes; and the sooner you take me there the better, if you wish to have the assistance of my legs in transporting me, for they are growing considerably stiff; I can tell you."

As soon as the difficulty of conveying him to bed was surmounted, Frank, borrowing a neighbour's horse, rode off to the village for the assistance of Mr Blandford, the only surgeon within some miles. He unfortunately being from home, Frank applied to me, supposing that a physician would answer the same purpose. It was a case scarcely within my province, but conceiving I might be of some use, I put a lancet in my pocket, and accompanied the messenger on his way back to the farm. I ascended to the apartment which the stranger occupied, and found him stretched upon the bed, apparently suffering very much from the effects of his accident. He regarded me, for some seconds, with a most acrimonious expression of countenance, and answered the questions which I found it necessary to put to him, at the least possible expense of words; differing very much, in this particular, from the generality of patients who have come under my notice. Every allowance, however, was to be made for his temper, the equilibrium of which, it must be confessed, such a tumble as he had met with was very likely to derange. I bled him, as a precautionary measure, and ordered some simple applications to his ankle, which had been severely sprained, and was much swollen. After assuring him that he need not entertain any apprehensions for the result of his accident, for that a few days' confinement would be the extent of the inconvenience, I promised to call on him again in a few days, and took my leave.

Agreeably to my promise, I called again at the farm, and found the stranger much improved, both in health and temper, although he was then very lame. He entered into conversation upon indifferent topics, in the course of which he dropped, as if incidentally, some questions regarding the character and circumstances of his host; in answering which, I bore testimony to the high respectability and worth of the one, and expressed my regret at the change which had occurred in the other.

The unremitting assiduity with which he was waited on by the family, combined, perhaps, with the improvement in his health, appeared to have wrought a material change in his behaviour towards them. His manner was more conciliating, particularly to Amy, who was frequently in attendance upon him. He never made the remotest allusion to his accident, until one day when the unlucky cur whose freak had occasioned it, happened to intrude into his apartment, he smiled, and remarked in reference to his own danger, and the sentence which had so nearly been executed on the dog, that their acquaintance had nearly proved fatal to both of them. He never mentioned his name, or dropped the slightest hint as to his quality, although there were some points in his conduct which did not altogether accord with the rank assigned to him by Frank. As soon as he could walk about without pain, he mingled freely with the family, and apparently took an interest in their concerns, and the business of the farm. The only suspicious circumstance connected with him was his uniformly retiring on the approach of strangers, so that, in fact, he was never seen by any but the family and their domestics.

The reader will not be surprised on learning that Amy had a lover; nay, he would rather marvel, perhaps, that she had not half a dozen, which, by the way, she might have had, for aught that I know to the contrary. Certain it is, however, she had but one favoured lover, and he was Robert Hawkhurst, the only son of an opulent freeholder in the neighbourhood, who farmed his own land. Robert was a tall, good-looking young man—Amy thought him handsome—and his general bearing and habits of life were adapted to the wealth, rather than

* The above paper is little else than an abstract of Dr. Robertson's View of the State of Europe, prefatory to his Life of Charles V.

to the occupation of his father, who had bestowed on him a fair education, kept him a horse, and extended to him other indulgences, which, it is but justice to add, were well merited by his son. His father, who did not at first oppose the intimacy between Robert and Amy, had no wish, when he saw how matters were going with the Hodsons, that his son should involve himself in their misfortunes, and therefore had of late discountenanced, although he did not altogether forbid, his visits. But the prudent caution of age and the generous devotion of youth are somewhat opposite counsellors; and Robert, if he had not been too affectionately attached to Amy, possessed too honourable a mind to desert her when the tide of her family's prosperity was turning. On the contrary, it was his pride and pleasure to show to those around him, that the change in her circumstances had produced no alteration in his love. He always called for her on his way to church, and left her at the farm on his return. He would frequently put a side-saddle on his horse, a high-couraged but temperate animal, and take her for a ride; and he often observed, that he loved his bonny bay the better for carrying his Amy so safely. In fact, it was remarked that his attentions increased as the fortunes of the family were verging towards the crisis of ruin.

It was within a few days of the period which the stranger had fixed for his departure, and while he was sitting with Andrew Hodson and his family, that the steward was observed approaching on horseback; when their guest, as was his custom, retired to his room, and, by accident or design, left the door communicating with the apartment he had quitted partially open. The visit of the steward was on no very agreeable errand, as may be imagined, its object being to demand payment of the rent due at the preceding quarter-day, the amount of which Andrew had used every exertion to raise, but in vain. The steward became pressing, and affected to lament the necessity imposed on him, by the orders of his Lordship, to distraint for the money, if it were not immediately forthcoming. The farmer, on the other hand, pleaded for a delay of a few weeks, alleging the hardness of the times for agriculturists, the very high rent at which he stood, and finally the severe loss he had sustained by the failure of the banker. The other, in reply, merely stated that the instructions of his master were imperative, and admitted neither of modification nor delay. "Alas!" said the distressed Andrew, "is there no method by which the sacrifice of my farming stock and furniture can be prevented?" "There is one way, Master Hodson," rejoined the steward, "at which I have hinted pretty strongly upon more than one occasion, but you either could not or would not understand me. You know I have long loved your daughter Amy, and if you will effectually favour my suit, I need scarcely tell you, that I would strain a point rather than that my father-in-law should be degraded in the eyes of the world by an execution being served upon his premises, and himself ejected from the farm." "What, Master Jenkins, you marry my daughter Amy!" said the honest farmer. "Ay, that I will!" responded the condescending steward, evidently mistaking an exclamation of surprise for an interrogatory. "Stop, stop, Master Jenkins," rejoined Andrew, "not quite so fast. Have you ever said any thing to Amy about the matter?" "Why, yes," said the other hesitatingly, "I have, but it is some time since." "Well, and what did she say?" "Nothing very favourable, I must confess," continued the steward, "or I should have had but to ask your sanction instead of the exercise of your interest, and, if necessary, your authority, on the occasion." "What! I persuade Amy to marry a man she does not like! Are you mad, Master Jenkins?" "Not quite," was the reply; "but I think you are, or you would not so hastily reject my offer. Come, come, Andrew, see only your own interest, and favour my views, and I will not only at once advance the money for the arrears of rent, but use my influence with my Lord to cancel the present lease, and grant you a new one on more easy terms." "No!" said the farmer, "not if you were to offer me the freehold, instead of a new lease. I will not sell my daughter to you, or any man: no, not if he was the king." "Then take the consequences, obstinate fool!" exclaimed the steward, throwing off the mask; "before you are three days older, you shall be left without a wisp of straw that you can call your own;" and he quitted the house breathing vengeance upon the devoted farmer and his family.

It occurred that on the same evening the stranger, pleading increased lameness, kept his apartment, into which Amy carried his tea. He remarked that her air was that of deep dejection, and that she had recently been in tears. On one occasion their eyes met, and she beheld him gazing upon her with an expression of kindness and sympathy, of which she had scarcely believed his rigid countenance susceptible. "What has happened, my pretty maid, that you look so sorrowful?" said he, in a tone of almost paternal tenderness. "Alas, sir!" said the afflicted girl, "my poor father has long been struggling with hard times and a heavy rent, and, being unable to raise the sum due at the last quarter, they are going to put an execution, I think they call it, on the premises, and turn him out of the house. I do not care so much for myself, but for my poor father and mother to be cast upon the wide world, in their old age, without a shilling, and, it may be, without a friend to help them—oh, sir! it is hard, it is very hard!" and she burst into tears.

The stranger drew out his handkerchief, and, passing it over his face, complained of the closeness of the evening, and walked to the window for air; then, returning to Amy, he took her hand. "Nay, my poor girl," continued he, "be comforted; things may not come to so bad a pass as you anticipate; your landlord, from all that I know and have heard of his character, is not a man to push matters to extremities with so old and honest a tenant as your father." "Alas, sir," rejoined Amy, "the landlord, though they say he is far from being a bad-hearted man, lives abroad, and cannot, at that distance, know an honest tenant from a dishonest one. Be-

sides, he leaves every thing to his steward, and he is a very wicked man, sir."

The stranger then quitted the room, pleading a desire to breathe a little fresh air before he retired to bed. On his return, in passing through the hall, he saw Andrew Hodson upon his knees, with an open book before him, and his fine countenance lifted towards heaven in the act of prayer, while his family and domestics were kneeling around him. Unwilling to disturb them, the stranger did not advance into the room so as to be seen; but, as he contemplated the group, he could not help thinking that there must surely be something more in religion than his philosophy had ascribed to it, since it could inspire with calmness, and even thankfulness and resignation, a family who were upon the brink of ruin, and who might on the morrow, like the Saviour in whom they trusted, have not where to lay their heads. "And these," thought he, "are they whom, under circumstances in which I should have been grateful to Providence for the preservation of my life, I stung with reproaches for what they could neither foresee nor prevent."

As he was passing on towards his bed-room, at the conclusion of the prayers, the farmer came up to him, and informed him of the calamity which was impending, intimating that it would be advisable for the stranger to depart early in the morning, as his horse would be included in the seizure which was expected to be made, under the execution, about noon. "I thank you, Mr Hodson," was the reply, "for your friendly caution, but never mind the horse. You sheltered me in my misfortune, and I will not desert you in yours. I cannot help you out in the payment of your rent, for my purse, you see," continued he, producing it, "is somewhat of the lightest; but I will wait the event, and, if I cannot avert the storm, I will try to comfort you under it. By the way, farmer, a word with you: these retainers of the law will make clean work of it when they come. That steward, if report belie him not, has the eye and rapacity of a hawk. They will not leave you so much as a wooden ladle. Now, I see you have some valuable articles of plate—that vase, for instance."—"Sir!" exclaimed Andrew inquiringly, having never before heard of such a thing. "I mean the cup and cover there," explained the other. "Ay," replied Andrew, "it was won by my grandfather at a ploughing match; it will grieve me to part with it." "No doubt it would," said the stranger; "there are those tankards, too—that ladle—those massive old-fashioned spoons; they are all very portable." "Well, sir," said the farmer, not understanding the stranger's drift. "How dull you are!" rejoined the other, touching him with his elbow. "How easy would it be to get these things out of the way. You could confide them to some friend or relative—your mother earth, for instance—until the sweeping hurricane of the law has blown over. You understand me now, do you not?" "Sir," replied the farmer, "you mean well enough, I dare say, but you do not know old Andrew Hodson, or you would not have made such a proposal to him." "Tush, man! the thing is done every day." "I am sorry for it, sir, because the world must be much worse than I took it to be. The debt is just, though my creditor is a hard one, and I will pay him as far as the things will go." "But I maintain that the debt is not a just one. Is not the rent much higher than is warranted by the value of the land?" said the stranger. "No matter, I agreed to pay it." "You are too scrupulous by half." "Now, what do you suppose, sir, my neighbours would think of me, if I were to follow your advice?" "Tut, tut, who will know any thing of the matter but you and I?" "God Almighty, sir," said the farmer. "But consider, my good man," continued the stranger, "there may be enough to pay your rent without these articles, the value of which would set you up in the world again; for remember, these harpies will take every thing away from you." "No, they won't; they can't take my wife, nor my children, nor my good name; and I would not part with one of them for all the gold that was ever coined." "You will not be guided by my counsel, then, and remove the plate?" said the stranger. "No, not a teaspoon of it," was the positive reply. "Then I can only say," added the other, snatching up his candle, and hastening to bed, "that you are, without exception, the most obstinate, impracticable, honest old man I ever met with, and I must forswear your company."

The morning arrived on which the storm, which had been so long gathering, was to break over the heads of the devoted farmer and his family, who were stirring unusually early. In fact, the expectation of the catastrophe had allowed them to sleep but little, as their looks, when they assembled at the breakfast-table, plainly indicated. The stranger also had quitted his bed an hour before his wont, and betrayed great restlessness in his manner, for he walked to the window which commanded the road every five minutes, as if watching for the arrival of the expected, but unwelcome visitors.

Giles Jenkins was in advance of his myrmidons a quarter of an hour's march, and, taking the farmer apart, said to him, "Master Hodson, I did not threaten you without the power to execute. The officers will be here in a few minutes, which you will do well to use in reconsidering my proposal. Give me your daughter, and not only shall every thing about you remain as it is, but the possession of it shall be secured to you for many years." The farmer, losing his patience at the repetition of the insulting pro-

posal, shook off the tempter (who, in his earnestness, had taken him by the arm), and said, "Villain, do your worst, for not for all you are going to take away from me—no, not for all your master's money, twice told, will I sell my lamb to the wolf." "Dotard," rejoined the steward, "you have pronounced your doom, and I go to fulfil it;" and, quitting the farmer, he conferred with his followers, who by this time had joined him, and they proceeded in their duty by taking an inventory of the farming stock, before they began on the household furniture.

Robert Hawkhurst arrived shortly afterwards and assisted the stranger in his endeavours to console the afflicted family. One of the domestics at length informed them that the officers were coming into the house to finish their task, when the stranger betrayed some little agitation, and retired to that part of the room in which he was least likely to attract observation. He had scarcely time to effect this, before the steward and his retainers entered, and proceeded in their ungracious office, without the slightest respect to the feelings of the sufferers. Giles Jenkins, in particular, appeared to exult in the exercise of his authority, and to take a pleasure in witnessing the distress which his cruelty had occasioned. The silver vase, before alluded to, was standing on a kind of sideboard in the apartment. The steward, who was about to remove it, had no sooner laid his fingers on it, than the voice of the stranger was heard exclaiming, "Mr Jenkins, I'll thank you to let that cup alone, for I like it very well where it is."

The steward withdrew his hand from the vessel, as if it had been of heated iron. He turned as pale as death, and he looked about in all directions, as if he thought the person from whom the voice proceeded was as likely to drop from the clouds, or start out of the earth, as to make his appearance from any other quarter. The stranger at last arose from his seat, and with a dignity which none of the family had before observed him to assume, he advanced into the middle of the room, and confronted the steward, who, somewhat recovering from his surprise, and glancing at the other's bandaged leg, said, with an affectation of great concern, "My lord, I grieve to see your lordship so lame." "You mistake, you abominable old hypocrite and measureless liar," said the earl; "a fortnight's residence in this house has cured me of my lameness, and my blindness too, and, having recovered the use of my own eyes, I shall have no further occasion for yours." "My lord!" stammered the steward. "Your lord no longer," said the earl, interrupting him; "how dared you, sir, for the gratification of your diabolical passions, abuse the powers with which I entrusted you, and oppress this worthy man, in direct contravention of my injunction, that you should, on no account, distraint upon a tenant, unless he were a fraudulent one. Now, be pleased to relieve me of your presence, taking with you these two worthy associates; and, do you hear me, sir, let your accounts be made up with all dispatch, for I shall shortly reckon with you. Then, addressing himself to the farmer, he continued: "Mr Hodson, I am very sorry for the trouble which this unfortunate affair has occasioned you. It was necessary, however, that I should have such evidence of that man's baseness. For yourself, I can only say, that your arrear is remitted, your present lease shall be cancelled, and substituted by another, at such a rent, that it shall not be my fault if you do not thrive again. I owe you thus much for the lesson you have taught me of resignation under unmerited calamity, as well as for the instance you have given me of uncompromising integrity, under circumstances of temptation that very few would have withstood. I pray you to forgive me for the experiment I made on your honour in the matter of the plate. It is refreshing to me, in my old age, to meet with such examples in a world which, I fear, I have hitherto regarded on the darker side. Your kindness, Mrs Hodson, and yours, Amy, to a petulant old man, I shall not forget; nor your honourable adherence to your mistress and her family in their adversity, Mr Robert. Of you, Frank, I have a favour to beg; you must give me that tierrier of yours, to which I am primarily indebted for my introduction to this house, and for the advantages which have resulted to me from it."

The earl, after taking a kind leave of the circle he had thus made happy, mounted his horse and departed to his mansion, from which he had been so long absent, and to which he was returning when he met with the accident already related. The occurrences which followed so inauspicious an event, produced a most beneficial effect upon his mind: he became a better, and consequently, a happier man. His lordship took up his permanent residence on the estate, to the great joy of the tenantry, and to the discomfiture of Mr Jenkins, who, it is almost needless to add, was dismissed in disgrace.

I know it will be considered a somewhat trite termination if I finish my story with a marriage; and yet, should any of my readers be curious upon the subject, I cannot deny that such an event took place, and that Amy forgot all her past sorrows in her Robert's affections.

* The above story is from "Tales of a Physician," by W. H. Harrison, London, 1839, 2 vols. and in all likelihood has furnished the plot of the popular dramatic piece, entitled "The Rent Day."

JUNE.

And after her came jolly June, array'd
All in green leaves, as he a player were;
Yet in his time he wrought as well as played,
That by his plough-irons mote right well appear.

SPENSER.

JUNE, the sixth month of the year, is understood to derive its name from Juno, a heathen goddess, in honour of whom a festival was celebrated at the beginning of the month. According to the old English distich,

"Summer is ycomen in,
Loud sing cuckoo;
Groweth seed,
And bloweth mead,
And springeth the weed anew."

"Thus," says Leigh Hunt, "sings the oldest English song extant, in a measure which is its own music." The temperature of the air, however, is still mild, and in our climate sometimes too chilly; but, when the season is fine, this is, perhaps, the most delightful month of the year. The hopes of spring are realised, yet the enjoyment is but commenced: we have all summer before us; the cuckoo's two notes are now at what may be called their ripest—deep and loud; so is the hum of the bee; little clouds lie in lumps of silver about the sky, and sometimes fall to complete the growth of the herbage; yet we may now lie down on the grass, or on the flowering banks, to read or write; the grasshoppers click about us in the warming verdure, and the fields and hedges are in full blossom with the clover, the still more exquisite bean, the pea, the blue and yellow nightshade, the fox-glove, the mallow, white briony, wild honeysuckle, and the flower of the hip or wild rose, which blushes through all the gradations of delicate red and white. The leaves of the hip, especially the young ones, are as beautiful as those of any garden rose. Towards evening, the bat and the owl venture forth, flitting through the glimmering quiet; and at night, the moon looks silveriest, the sky at once darkest and clearest; and when the nightingale, as well as the other birds, have done singing, you may hear the undried brooks of the spring running and panting through the leafy channels. "It ceased," says the poet, speaking of a sound of heavenly voices about a ship—

"It ceased; yet still the sails made on,
A pleasant noise, till noon;
A noise like of a hidden brook
In the leafy month of June,
That to the sleeping woods all night
Singeth a quiet tune."

"There is a greater accession of flowers in this month than in any other. In addition to those of the last, the garden sparkles with marygold, golden-rod, larkspur, sun-flowers, anaryths (which Milton intermingles with sun-beams for his angel's hair), lupins, carnations, Chinese pinks, holyhocks, ladies' slipper, annual stocks, campanulas, or little bells, martagons, periwinkles, wall-flower, snapdragon, orchis, nasturtium, apocynum, chrysanthemum, corn flower, gladiolus, and convolvulus. The rural business of this month is made up of two employments, as beautiful to look at as they are useful—sheep-shearing and hay-making. Something like a holiday is still made of the former; and in the south-west of England, the custom, we believe, is still kept up of throwing flowers into the streams—an evident relic of paganism; but, altogether, the holiday is but a gleam of the same merry period in the cheap and rural time of our ancestors.

GARDENING.—The operations in the open garden during June are chiefly cleaning and refreshing; that is, hoeing, weeding, stirring, and watering. No main crops are now sown; but peas and beans may be put in the ground every two weeks, or ten days. Pickling cucumbers and gourds may be sown in the open garden, or on hillocks of hot dung, covered by a bell or hand-glass. New planted wall-trees to be trained in the horizontal manner, may have their leading shoots stopped about the middle, or towards the end of the month.

TOWN PIPERS.

In ancient times, almost every town, especially in the south of Scotland, had a piper, whose office was often hereditary, and who was generally attached to the burgh establishment of the place. These functionaries, who are supposed to have been the last remains of the minstrels of a more early age, were frequently the depositaries of oral, and particularly of poetical tradition. About spring time, and after harvest, it was the custom of these musicians to make a progress through a particular district of the country. The music and the tale repaid their lodging, and they were usually gratified with a donation of seed corn. They received a livery and small salary from the community to which they belonged; and, in some burghs, they had a small allotment of land, called the Piper's Croft. It was the custom of James Ritchie, the town-piper of Peebles, who was among the last of his order, to make his rounds annually on *Handsel Monday*, or the first Monday of the year, for the purpose of receiving a gratuity from the different householders. His uniform consisted of a pair of red breeches and coat, of an antique fashion, with a looped-up cocked hat, and, till the last, he wore a plated queue. Robin Hastie, the last town piper of Jedburgh, and a contemporary of

Ritchie, died about the beginning of the present century. His family was supposed to have held the office for about three centuries. Old age had rendered Robin a wretched performer; but he knew several old songs and tunes, which have probably died along with him. This order of minstrels is alluded to in the comic song of *Maggy Lauder*, who thus addresses the piper—

"Live ye upon the Border."

Habbie Simpson, to whom the lady farther alludes, was not a piper in a bordertown; he belonged to Kilbarchan, in Renfrewshire, where the author of the song, Robert Sempill, the son of Sir James Sempill, the ambassador to England in 1599, had an opportunity of being acquainted with his name and character. From the notoriety which Habbie thus acquired, the people of Kilbarchan have had some reason to be proud of having possessed such a personage; and his statue, copied from an original picture, has lately been affixed to the steeple of the school-house of the town.

WAT OF HARDEN.

WE may form some idea of the style of life maintained by the border marauders from the anecdotes handed down by tradition concerning Walter Scott of Harden, or, as he was usually styled, *Auld Wat of Harden*, who flourished towards the middle of the sixteenth century. This ancient laird was a renowned freebooter, and used to ride with a numerous band of followers. The spoil which they carried off from England or from their neighbours was concealed in a deep and impervious glen, on the brink of which the old tower of Harden was situated. From thence the cattle were brought out, one by one, as they were wanted to supply the rude and plentiful table of the laird. When the last bullock was killed and devoured, it was the lady's custom to place on the table a dish, which, on being uncovered, was found to contain a pair of clean spurs—a hint to the riders that they must shift for their next meal. Upon one occasion when the village herd was driving out the cattle to pasture, the old laird heard him call loudly to drive out *Harden's cow*. "*Harden's cow!*" echoed the affronted chief; "is it come to that pass? Bymy faith, they sell sune say Harden's kye" (cows.) Accordingly he sounded his bugle—mounted his horse—set out with his followers—and returned next day with a "bow of kye and a bassened bull." On his return with this gallant prey, he passed a very large hay-stalk. It occurred to the provident laird that this would be extremely convenient to fodder his new stock of cattle; but as no means of transporting it occurred, he was fain to take leave of it with this apostrophe, now proverbial, "By my conscience, had ye but four feet, ye should not stand lang there."

Wat of Harden was married to Mary Scott, celebrated in song by the title of the Flower of Yarrow. By their marriage-contract, the father-in-law, Philip Scott of Dryhope, was to find Harden in horse and man's meat, at his tower of Dryhope, for a year and a day; but five barons pledged themselves that, at the expiry of that period, the son-in-law should remove, without attempting to continue in possession by force! A notary-public signed for all the parties to the deed, none of whom could write their names. The original is still in the charter-room of the present Mr Scott of Harden. By the Flower of Yarrow, the Laird of Harden had six sons; five of whom survived him, and founded the families of Harden (now extinct), Highchesters now representing Harden, Reburn, Wool, and Synton. The sixth son was slain at a fray in a hunting match by the Scotts of Gilmanscleugh. His brothers flew to arms; but the old laird secured them in the dungeon of his tower—hurried to Edinburgh—stated the crime—and obtained a gift of the lands of the offenders from the crown. He returned to Harden with equal speed, released his sons, and shewed them the charter. "To horse, lads!" cried the savage warrior, "and let us take possession; the lands of Gilmanscleugh are well worth a dead son." The property thus obtained continued in the family till the beginning of last century, when it was sold by John Scott of Harden, to Anne, Duchess of Buccleuch.

EMIGRATION.

THE Editor has been occasionally called upon to offer some information and advice in regard to the subject of emigration to New South Wales and Van Dieman's Land. He, however, studiously refrains from exciting any desire to emigrate to these regions. He has perused the works of almost every writer on these countries, as well as various detached papers, and consulted with persons who have been in the colony, and it is now his deliberate opinion that emigration towards that quarter of the empire is most improper under almost any circumstances. Both New South Wales and Van Dieman's Land are crowded with a population formed of the offscourings of every town in England, Scotland, and Ireland—ruffians who break away in bands from their employers, and scour the settlements as freebooters. The natives are also more ferocious and troublesome than the savages of any other part of the known world. The emigrant who settles in these distant countries generally bids adieu to comfort and peace of mind. Unless in some favoured spots, he will find an absolute necessity of being constantly armed—a pair of loaded pistols must be his pillow and table companions! Who would not much rather

descend to the meanest employment at home than endure the horrors of such a life? The distance from Great Britain, and the difficulty of carrying on trade with Europe, the great seat of consumption of produce, are also serious drawbacks. A good climate, soil, &c. can never compensate for the miseries of a settlement in such a place. Almost no country has been so shamefully overpraised as New South Wales. Books have been written to decoy settlers; and it is lamentable to state, they have been generally too successful. The work of the chief writer, it is confidently related by those who know the country from sad experience, is a tissue of exaggerated statements and fallacies. As these countries must necessarily undergo many important changes in their moral as well as in their physical condition, before they be fit for the settlement of families accustomed to enjoy a peaceful state of life, even though it be a poor one, those who feel inclined to seek a more profitable and pleasing scene for the development of their manful energies must look across the Atlantic, and either in the United States of America, or Upper Canada, find their place of abode. In these favoured lands they need never lack the means of a humble and comfortable subsistence, provided they be but industrious; and they will, in almost every case, have the gratification of leaving their families in a state of comparative ease and competence. By emigration thither, they but remove, as it were, from one part of the United Kingdom to another; they settle amidst a people speaking the same language, of kindred affections, and endowed with the same virtuous political independence. To establish themselves in this productive and salubrious country, they do not pay a heavy penalty. They leave an island choked with a population of paupers; and perhaps from a bleak ungenial moor, which it would require millions of pounds to cultivate and render useful in the production of food, they are transferred to broad fertile prairies, which, by the slightest exertion, can be made to wave with the yellow grain of autumn.—Intending emigrants will find much useful information for their purpose in the previous numbers of the Journal. The Editor would also recommend them to purchase a small publication entitled, "*Hints on Emigration to Upper Canada*, by Martin Doyle," which is sold for one shilling, and may be obtained from booksellers in London, Dublin, or Edinburgh. It is the best manual on the subject.

The following extract from this little work, though perhaps too highly coloured, will give the reader an idea of the strain in which it is written. The recommendation given as to the place best adapted for settlement agrees with that which I have already offered.

"What a country will this yet become! Its free navigation, from the remotest parts of the interior to the ocean, commanding the export of the finest wheat the world produces; timber of the best descriptions, and all the other produce which the industry of man can raise in this most fertile region.

The rise and fall of nations and of empires are under the control of infinite wisdom. If with the new settlers, religious and moral habits be introduced, it may please that Mighty Power, whose impartial judgment decides on ruin or prosperity, to use this secondary cause of emigration, as the great instrument of rewarding individual merit, and raising up to a commanding eminence this once savage and benighted country, through the light of truth and the blessings of civilization. And it must naturally occur to the well disposed settler, that though his lot may perchance for a short time be cast beyond the reach of regular religious instruction, yet that the good Christian has always a *Friend above*, to whose willing ear he may address himself; nor will the anxious parent pass over without thankfulness the blessing of comparative solitude, if it shall have removed the objects of his affection from demoralizing scenes of bad example, and placed them where the good result of religious exercise will not be defaced by evil communications, and where a patriarchal life of faith and holiness, with industrious self-exertion, cannot fail (under God's blessing) to produce prosperity and happiness."

But to proceed with my details: there are various other lakes which have not been mentioned—lake Simcoe, and many others on the northern side of lake Ontario, and the St Lawrence, which will at no very remote period, it is probable, be connected by canals with each other and with the ocean. One great water-course is now almost completed from Kingston at the eastern extremity of Ontario, 133 miles in a northerly direction, consisting of a chain of lakes, joined by canal work, which unites them with the grand, or Ottawa river, so as to avoid the navigation of the St Lawrence from thence to Montreal; that portion of it being full of dangerous and troublesome rapids. The Ottawa meets the St Lawrence a few miles above Montreal, from which place to the ocean there is an uninterrupted sea navigation; this canal lengthens the distance from Montreal to Ontario very considerably; but the saving in time and expense will be very great indeed; and should was unhappily occur with the States, it secures a free intercourse between Quebec, through Montreal, to the Upper Province, which might otherwise be frequently interrupted by the Americans, who possess one side of the St Lawrence. In time of war such a passage could not be thought of—without this canal you could not feel security—with it you have the certainty, at all times, and under all circumstances, of communication with Quebec, and consequently with your native country.

From Upper Canada, the colonists can send their timber and corn either to Montreal by the lakes, &c. (the course of which I have already pointed out), or by the Erie canal to New York; having two great outlets for the productions of their lands, and for the return of purchased articles—clothes, furniture, implements, &c.—they can, according to the rates of freight, and comparative state of sales at Montreal, Quebec, or New York, select the most advantageous market.

With regard to the soil. From the authority before quoted, we have these observations:—

"Upper Canada is blessed with as productive soil as

any in the world, and it is easily brought into cultivation. The nature of the soil may be invariably discovered by the description of timber it bears. Thus, on what is called hard timbered land, where the maple, beech, black birch, ash, cherry, lime, elm, oak, black walnut, butter-nut, hickory, plane, and tulip tree, &c. are found, the soil consists of a deep black loam. Where the fir and hemlock pine are intermixed in any considerable proportion with other trees, clay predominates; but where they grow alone, which is generally on elevated situations, sand prevails. This also happens where the oak and chestnut are the only trees. These sandy soils, though naturally unfavourable to meadow and pasture, are found to produce the brightest and heaviest wheats, and can, with the assistance of gypsum, which abounds in many parts of the province, be made to bear the finest possible crops of clover and Indian corn. In moist seasons the clays furnish the greatest burthen of grass. Perhaps there does not exist in any quarter of the globe a country of the extent of Upper Canada, containing so small a quantity of waste land, either of marsh or mountain, yet there is not any deficiency of water; for, independently of the numerous rivers and streams which flow through the country on every side, good springs are universally found either on the surface or by digging for them.

The country is generally level, and covered with timber. Every description of soil can be had, so that the settler has it in his power to choose the description which he likes best; but unless he is an infallible judge of the qualities of land, I recommend his taking one who is perfectly so along with him, when about to make his selection. The surface is composed of a rich coat of vegetable mould, the deposit of decayed leaves, and wood from unnumbered ages, which, when tilled, yield several successive crops of great luxuriance, without manure. In some places, on the banks of rivers, are to be met rich and extensive tracts of alluvial soil, and beyond these, rise, in beautiful elevation, portions of land the most tempting in their situations.

This excellent soil, however, is very unfairly treated by being kept under an unceasing succession of corn crops, without manure, and any land so treated, however naturally fertile, must be at length impoverished. There is less marshy or swampy land, it has been just now said, for its extent, in Upper Canada, than in any other part of the world; there are, however, some low and swampy grounds, and these, until the progress of population and improvement shall make it worth while to drain them, are the only situations from which I warn you to keep clear, while high and dry land, prudently chosen near the lakes or rivers, can be purchased out and out—in fee, as it is termed—for such a trifle as ten shillings an acre!!

Just fancy yourselves possessed of *real property*, on such terms—no yearly tenancy—no terminable leases to breed interminable jealousies at the change of occupants, but pure fee simple—no rent to pay—after labouring here for a shilling, or tenpence, or eightpence, or sixpence, a-day. What a happy change would this be, and how irresistible the temptation to make the experiment! And only think of the advantage of working a rich, maiden soil, that will yield abundantly, instead of ploughing or digging a worn out one at home, without manure to mend it, and which, without abundance of it, will not yield a crop sufficient to pay its labour.

In trying the new country and the fresh soil, mind to fix yourselves near water carriage. I myself should prefer the banks of Lake Ontario, but there are excellent quarters about Lake Huron, where the climate is still milder, and the soil is said to be admirable; in either of these districts you can procure lots of land, of sand, loam, or clay—please yourselves—no compulsion to buy one lot if you like another better. The soil in the Huron territory is a rich sandy loam, suited to the culture of tobacco, of which much is grown there.

The Huron territory is a tract of 1,100,000 acres, in the shape of a triangle, its base being about sixty miles in length, resting on Lake Huron, and having a direct navigable communication, through Lakes Erie and Ontario, with the Atlantic.

The chief town in this district, called Goderich, is at the confluence of the river Maitland with Lake Huron, which promises, from its local advantages, to become one of the most important and flourishing settlements in the province.

Several enterprising colonists, attracted by these advantages, have left their farms in the neighbourhood of York, to settle at Goderich, with the intention of erecting a brewery, distillery, brick-kilns, and a grist-mill; a tavern and saw-mill have already been erected. The harbour, the only one on the Canadian side of the lake, is capable of containing vessels of the burden of 200 tons; and it has been established as a port of entry, which will insure to the inhabitants a great share of the trade with the upper countries, and their opposite neighbours in the new settlements in the United States.

The scenery on the river Maitland has been described as more like English than any other in America. There is abundance of brick-earth and potters' clay in every direction round the town.

Roads are in progress, an important preliminary to civilisation, which will connect the Huron Tract with Port Talbot and the various settlements and towns on Lake Erie and the Niagara frontier. Cattle and provisions can be obtained in abundance by this route, or by the still more easy water communication between Goderich and the old well-cultivated settlement of Sandwich, Amherstburgh, and Detroit. A road has also been completed, as before mentioned, from Goderich, by Wilnot and Guelph, to the head of Lake Ontario and York; and it is intended to improve and maintain all these communications, under the direct inspection of the officers of the government, so as to make them in every respect equal to the best roads in the oldest settlements in the province.

With respect to the important considerations of climate

and soil in the Huron Tract, there is every reason to believe the former as good as the best in Upper Canada; and upon the latter point, it is only necessary to quote the words of the surveyor who has been employed to lay out the line of road through the heart of the tract:—"The quality of the soil through the whole thirty-three miles, is such, that I have not seen its equal in the province; the soil is generally composed of a deep, rich, black loam, thinly timbered. For the purpose of the intended road, there is not one mile in the whole distance otherwise than favourable; and there are four permanent streams, branches of main rivers."

BIOGRAPHIC SKETCHES.

HERSCHEL.

ONE of the very greatest names in the modern history of astronomical discovery is that of the late illustrious Sir William Herschel; and he also was self-instructed in the science in which he earned his high reputation. Herschel was born at Hanover, in 1738, and was the son of a musician in humble circumstances. Brought up, as well as his three brothers, to his father's profession, for which it has been said that he qualified himself without much teaching, he was placed, at the age of fourteen, in the band of the Hanoverian Guards. A detachment of this regiment having been ordered to England in the year 1757 (or according to another account, 1759), he and his father accompanied it; but the latter returned to Germany in the course of a few months, and left his son, in conformity with his own wish, to try his fortune in London. For a long time the young man had to struggle with many difficulties; and he passed several years principally in giving lessons in music to private pupils in the different towns of the north of England. At last, in 1765, through the interest of a gentleman to whom his merits had become known, he obtained the situation of organist at Halifax; and next year, having gone to fulfil a short engagement at Bath, he gave so much satisfaction by his performances, that he was appointed to the same office in the Octagon Chapel of that city, upon which he went to reside there. The place which he now held was one of some value; and, from the opportunities which he enjoyed, besides, of adding to its emoluments by engagements at the rooms, the theatre, and private concerts, as well as by taking pupils, he had the certain prospect of deriving a good income from his profession, if he had made that his only or his chief object.

But long before this his active and aspiring mind had begun to direct its attention to other pursuits offering a wider scope for the exercise of its talents. While yet only an itinerant teacher of his art in country towns, Herschel had assiduously devoted his leisure, not only to the making himself more completely master of the language of his adopted country, but also to the acquiring of a knowledge of the Italian, the Latin, and even the elements of the Greek. At this time, probably, he looked to these attainments principally with a view to the advantage he might derive from them in the prosecution of his professional studies; and it was no doubt with this view also that he afterwards applied himself to the perusal of Dr Robert Smith's 'Treatise on Harmonics'—one of the most profound works on the science of music which then existed in the English language. But the acquaintance he formed with this work was destined ere long to change altogether the character of his pursuits. He soon found that it was necessary to make himself a mathematician, before he could make much progress in following Dr Smith's demonstrations. He now, therefore, turned with his characteristic alacrity and resolution to the new study to which his attention was thus directed; and it was not long before he became so attached to it, that almost all the other pursuits of his leisure hours were laid aside for its sake.

During his residence at Bath, although greatly occupied with professional engagements, the time he devoted to his mathematical studies was rather increased than diminished. Often, we are told, after a fatiguing day's work of fourteen or sixteen hours among his pupils, he would, on returning home at night, repair for relaxation to what many would deem these severe exercises. In this manner, in course of time, he attained a competent knowledge of geometry, and found himself in a condition to proceed to the study of the different branches of physical science which depend upon the mathematics. Among the first of these latter that attracted his attention were the kindred departments of astronomy and optics. It has been stated that Herschel's first attempts in the fabrication of magnifying-glasses were occasioned by his reading something upon that subject in a copy of Smith's optics, which accidentally fell in his way; but this story is perhaps nothing more than a version of the fact already mentioned, that his acquaintance with the mathematics began in his study of the 'Treatise on Harmonics,' by the writer in question. Another account of the matter which has been given is, that having, in the course of his philosophical studies, applied himself to the sciences of optics and astronomy, he became desirous of beholding with his own eyes those wonders of the heavens, of which he read so much, and for that purpose he borrowed from an acquaintance a two-feet Gregorian telescope. This instrument interested him so greatly, that he determined to procure one of his own, and commissioned a friend in London to purchase one for him, of a somewhat larger size. But

he found the price was beyond what he could afford. To make up for this disappointment he resolved to attempt to construct a telescope for himself; and after encountering innumerable difficulties in the progress of his task, he at last succeeded, in the year 1774, in completing a five-feet Newtonian reflector. This was the beginning of a long and brilliant course of triumphs in the same walk of art, and also in that of astronomical discovery.

Herschel now became so much more ardently attached to his philosophical pursuits, that, regardless of the sacrifice of emolument he was making, he began gradually to limit his professional engagements and the number of his pupils. Meanwhile he continued to employ his leisure in the fabrication of still more powerful instruments than the one he had first constructed; and in no longer time he produced telescopes of seven, ten, and even twenty feet focal distance. In fashioning the mirrors for these instruments his perseverance was indefatigable. For his seven-feet reflector, it is asserted that he actually finished and made trial of no fewer than two hundred mirrors before he found one that satisfied him. When he sat down to prepare a mirror, his practice was to work at it for twelve or fourteen hours, without quitting his occupation for a moment. He would not even take his hand from what he was about, to help himself to food; and the little that he ate on such occasions was put into his mouth by his sister. He gave the mirror its proper shape, more by a certain natural tact than by rule; and when his hand was once in, as the phrase is, he was afraid that the perfection of the finish might be impaired by the least intermission of his labours.

It was on the 13th of March 1781 that Herschel made the discovery to which he owes, perhaps, most of his popular reputation. He had been engaged for nearly a year and a half in making a regular survey of the heavens, when, on the evening of the day that has been mentioned, having turned his telescope (an excellent seven-feet reflector, of his own constructing) to a particular part of the sky, he observed among the other stars one which seemed to shine with a more steady radiance than those around it; and, on account of that, and some other peculiarities in its appearance, which excited his suspicions, he determined to observe it more narrowly. On reverting to it after some hours, he was a good deal surprised to find that it had perceptibly changed its place—a fact which, the next day, became still more indisputable. At first he was somewhat in doubt whether or not it was the same star which he had seen on these different occasions; but, after continuing his observations for a few days longer, all uncertainty upon that head vanished. He now communicated what he had observed to the astronomer Royal, Dr Maskelyne, who concluded that the luminary could be nothing else than a new comet. Continued observation of it, however, for a few months dissipated this error; and it became evident that it was, in reality, a hitherto undiscovered planet. This new world, so unexpectedly found to form a part of the system to which our own belongs, received from Herschel the name of *Georgium Sidus*, or Georgian Star, in honour of the King of England; but by continental astronomers it has been more generally called either *Herschel*, after its discoverer, or *Uranus*. Subsequent observations, made chiefly by Herschel himself, have ascertained many particulars regarding it, some of which are well calculated to fill us with astonishment at the powers of the sublime science which can win its way so far into the immensity of space, and bring us back information so precise and various. In the first place, the diameter of this new globe has been found to be nearly four and a half times larger than that of our own. Its size altogether is about eighty times that of our earth. Its year is as long as eighty-three of ours. Its distance from the sun is nearly eighteen hundred millions of miles, or more than nineteen times that of the earth. Its density, as compared with that of the earth, is nearly as twenty-two to one hundred; so that its entire weight is not far from eighteen times that of our planet. Finally, the force of gravitation near its surface is such, that falling bodies descend only through fourteen feet during the first second, instead of thirty-two feet, as with us. Herschel afterwards discovered, successively, no fewer than six satellites or moons, belonging to his new planet.

The announcement of the discovery of the *Georgium Sidus* at once made Herschel's name universally known. In the course of a few months the king bestowed upon him a pension of three hundred a-year, that he might be enabled entirely to relinquish his engagements at Bath; and upon this he came to reside at Slough, near Windsor. He now devoted himself entirely to science; and the constructing of telescopes, and observations of the heavens, continued to form the occupations of the remainder of his life. Astronomy is indebted to him for many other most interesting discoveries besides the celebrated one of which we have just given an account, as well as for a variety of speculations of the most ingenious, original, and profound character. But of these we cannot here attempt any detail. He also introduced some important improvements into the construction of the reflecting telescope, besides continuing to fabricate that instrument of dimensions greatly exceeding any

that had been formerly attempted, with the powers surpassing, in nearly a corresponding degree, what had ever been before obtained. The largest telescope which he ever made, was his famous one of forty feet long, which he erected at Slough, for the king. It was begun about the end of the year 1785, and on the 28th of August 1789 the enormous tube was poised on the complicated, but ingeniously contrived mechanism by which its movements were to be regulated, and ready for use. On the same day a new satellite of Saturn was detected by it, being the sixth which had been observed attendant upon that planet. A seventh was afterwards discovered by means of the same instrument. This telescope has recently been taken down, and replaced by another of only one half the length, constructed by Mr J. Herschel, the distinguished son of the subject of our present sketch. Herschel himself eventually became convinced that no telescope could surpass in magnifying power one of from twenty to twenty-five feet in length. The French astronomer, Lalande, in his continuation of Montucla's History of the Mathematics, states, that he was informed by George III. himself, that it was at his desire that Herschel was induced to make the telescope at Slough of the extraordinary length he did, his own wish being that it should not be more than thirty feet long.

So extraordinary was the ardour of this great astronomer in the study of his favourite science, that for many years, it has been asserted, he never was in bed at any hour during which the stars were visible. And he made almost all his observations, whatever was the season of the year, not under cover, but in his garden, and in the open air—and generally without an attendant. There was much that was altogether peculiar to himself, not only in the process by which he fabricated his telescopes, but also in his manner of using them. One of the attendants in the king's observatory at Richmond, who had formerly been a workman in Ramsden's establishment, was forcibly reminded, on seeing Herschel take an observation, of a remark which his old master had made. Having just completed one of his best telescopes, Ramsden, addressing himself to his workmen, said, "This, I believe, is the highest degree of perfection that we opticians by profession will ever arrive at; if any improvement of importance shall ever after this be introduced in the making of telescopes, it will be by some one who has not been taught his art by us."

Some years before his death the degree of Doctor of Laws was conferred upon Herschel by the University of Oxford; and in 1816, his late Majesty, then Prince Regent, bestowed upon him the Hanoverian and Guelphic Order of Knighthood. He died on the 23d of August 1822, when he was within a few months of having completed his eighty-fourth year.—*Library of Entertaining Knowledge.*

THE BISCUIT.

[FROM THE MILITARY SKETCH BOOK.]

Our advanced guard had been skirmishing with the enemy for five days, and with empty stomachs. The commissary of the division had either missed us in his march with the provisions, for which he had been dispatched to the rear, or else had not been successful in procuring a supply. But whatever might have been the cause, the consequence was trying to us; for the men, officers and all, were wholly without provisions for three days. At the time the commissary went to the rear, two pounds of biscuit, one pound of meat, and a pint of wine, were served out to each individual; and upon this quantity we were forced to exist for five days; for nothing was to be bought. If we had been loaded with gold, we could not have purchased a morsel of any sort of food.

Most of the men, from having been accustomed to disappointment of supplies of rations, managed their little stock of provisions so economically, that it lasted nearly three days, but the greater part finished it in half the time. As the men grew weaker, the work grew heavier; and as hunger increased, so did the necessity for physical exertion. The enemy were constantly annoying us, and every hour of the day brought a skirmish, either with their little squads of cavalry, their riflemen, or their voltigeurs. The latter were troops of very short stature and strong make, very much esteemed by Napoleon. They wore short breeches and half gaiters, and none of the men were more than five feet three inches high. The rifles would advance by the cover of a hedge, or hill perhaps, while the voltigeurs would suddenly dart out from a ditch, into which they had crept under cover of the weeds, and fall upon our picquets with the ferocity of bull-dogs; and when they were mastered, would (if not killed, wounded, or held fast) scamper off like kangaroos. In like manner the cavalry would try to surprise us; or, if they could steal upon us, would dash up, fire their pistols, and, if well opposed, gallop off again.

On the fifth morning after the commissary had delivered the rations above mentioned, we had a very sharp brush with the enemy. A company of infantry and a few dragoons were ordered to dislodge the French from a house in which they had a party, and which was necessary to the security of our position; for, from this house, they used to sally upon our picquets in a most annoying manner. The French, not more than fifty in number, made a considerable resistance; they received the English with a volley from the windows, and immediately retreated to a high bank behind the house. From this point they continued to fire until their flank was threatened by our dragoons, when they retreated in

double-quick disorder, leaving about fifteen killed and wounded.

Our men were then starving. The poor fellows, although they had forgotten their animal wants in the execution of their duty, plainly displayed in their faces the weakness of their bodies. Every man of the crowded encampment looked wan and melancholy; and all kept up their flagging spirits by resolution and patience. Many a manly fellow felt in silence the bitterness of his situation. There were no upbraiding, for all were sufferers alike.

In about an hour after the taking of the old house in front, I went out from our huts in a crowd to see the place of action. I met four or five of our men wounded, led and carried by their comrades. The officer commanding the party now joined me, and walked back to the house, to give farther directions regarding other wounded men not yet removed. When we had gone about fifty yards, we met a wounded soldier carried very slowly in a blanket by four men. As soon as he saw the officer who was along with me, he cried out in a feeble but forced voice, "Stop! stop!—lay me down—let me speak to the captain." The surgeon, who was along with him, had no objection, for, in my opinion, he thought the man beyond the power of his skill, and the sufferer was laid gently down upon the turf, under the shade of a projecting rock. I knew the wounded man's face in a moment, for I had often remarked him as being a steady, well-conducted soldier; his age was about forty-one or two, and he had a wife and two children in England. I saw death in the poor fellow's face. He was shot in the throat, or rather between the shoulder and the throat; the ball passed apparently downwards, probably from having been fired from the little hill on which the French posted themselves when they left the house. The blood gurgled from the wound at every exertion he made to speak. I asked the surgeon what he thought of the man, and that gentleman whispered, "It is all over with him." He said he had done every thing he could to stop the blood, but found, from the situation of the wound, that it was impossible to succeed.

The dying soldier, on being laid down, held out his hand to my friend the Captain, which was not only cordially received, but pressed with pity and tenderness by that officer. "Sir," said the unhappy man, gazing upon his Captain with a look such as I shall never forget—"Sir, you have been my best friend ever since I entered the regiment—you have been every man's friend in the company, and a good officer.—God bless you! You saved me once from punishment, which you and all knew afterwards that I was unjustly sentenced to. God bless you!" Here the tears came from his eyes, and neither the Captain, nor any one around, could conceal their kindred sensation.

The poor sufferer resumed—"I have only to beg, Sir, you will take care that my dear wife and little ones shall have my back pay as soon as possible—I am not many hours for this world." The Captain pressed his hand, but could not speak. He hid his face in his handkerchief.

"I have done my duty, Captain—have I not, Sir?" "You have, Tom, you have, and nobly done it," replied the Captain, with great emotion.

"God bless you!—I have only one thing more to say." Then addressing one of his comrades, he asked for his haversack, which was immediately handed to him. "I have only one thing to say, Captain," said he, "I have not been very well this week, Sir, and did not eat all my rations. I have one biscuit—it is all I possess. You, as well as others, Sir, are without bread; take it for the sake of a poor grateful soldier—take it—take it, Sir, and God be with you!"

The poor good-natured creature was totally exhausted as he concluded; he leaned back—his eyes grew a dull glassy colour—his face still paler, and he expired in about ten minutes after on the spot. The Captain wept like a child.

Few words were spoken. The body was borne along with us to the wood where the division was bivouacked, and the whole of the company to which the man belonged attended his interment, which took place in about two hours after. He was wrapped in his blanket, just as he was, and laid in the earth. The Captain himself read a prayer over his grave, and pronounced a short but impressive eulogy on the merits of the departed. He showed the men the biscuit, as he related to them the manner in which it had been given to him, and he declared he would never taste it, but keep the token in remembrance of the good soldier, even though he starved. The commissary, however, arrived that night, and prevented the necessity of trial to the Captain's amiable resolution. At the same time, I do believe that nothing would have made him eat the biscuit.

This is no tale of fiction: the fact occurred before the author's eyes. Let no man, then, in his ignorance, throw taunts upon the soldier, and tell him that his gay apparel and his daily bread are paid for out of the citizen's pocket. Rather let him think on this biscuit, and reflect, that the soldier earns his crust as well as he, and when the day of trial comes, will bear the worst and most appalling privations, to keep the enemy from snatching the last biscuit out of the citizen's mouth. It is for his countrymen at home that he starves—it is for them he dies.

THE ENCHANTED SLEDGE.

ONE of the most important employments at a certain period of the pastoral year in the south of Scotland, is the digging, drying, and driving home of the peat, which is almost the only fuel in these parts. The tough surface is paired off with the turf-spade, or *slaughter*; the firmer moss beneath is cut, by means of a spade of a particular construction, into quadrangular pieces rather more than a foot in length; these are lifted and laid along, side by side, till they acquire a certain hardness, when they are set on end, into a multitude of little pyramids, something in the same

way as soldiers pile their muskets. After continuing in this position for some time, the peats are collected and built into *wind-raus* and *rickles*—small heaps, that is, through which the wind sifts, and gives them that degree of dryness that they are fit for burning. They are then driven home, built into large stacks for winter use, and covered with thatch.

As the moss best fitted for furnishing this kind of fuel is frequently found at the tops of nearly inaccessible mountains, the driving of the fuel home requires long and patient labour; for a very small load only can be removed at a time, and that by a road that every step must be looked to before it is ventured upon. Wheeled teams would be totally unmanageable on many of these trackless steeps. What is called a *slippe* is therefore used, which resembles a cart dismounted from its wheels, only the shafts have a curve upwards, so as to bring them up to the horse's sides, while the body of the vehicle *slypes*, or slides, along the ground. In places still more impracticable, where the action of shafts would bring the horse to the ground, or knock it about too unmercifully, the *sled*, or sledge, is resorted to, which has no shafts, but is drawn by chains fastened with hooks, which may be lifted out whenever the act of drawing is relaxed.

In this occupation of driving home peats in a sled, Thomas Leytyle was employed when a very odd adventure befel him. Thomas was a man that conducted his horse and cart after a most primitive manner. With the simple sort of carriage which has been described, it will readily be imagined that the harness was not of a very tasteful description. The horse was not taught with a curb-bridle to arch its neck proudly, but was led by a halter of hemp, fastened round its head, without either blinders or bit. This halter was of considerable length, and it was the shepherd's practice to hold by its extremity with both hands brought round behind him, while he walked in front of his equipage, pulling stoutly, and thereby acting in some sort as a trace horse. The head of the animal was thus brought into an horizontal position in a line with its neck, and projected very much like the mouth of a piece of ordnance over its carriage.

In this way the good man saw any obstacle which the rough tract presented, and avoided or removed it. Many a time did he push over with his foot a large stone, which bounded off down the side of the mountain, to the no little risk and very great terror of the sheep that happened to be feeding there—and all because he was a merciful man to his beast. He seldom looked back. When the horse wanted a few moments rest, it made a pause of its own accord, as, to be sure, it best knew when such a pause was necessary; and its conductor good naturedly halted, too, till it was the horse's pleasure to move forward again. Thomas did not alter his position upon these occasions, but stood in the middle of the path, keeping the halter at the stretch, and ready to proceed whenever he found the mass behind him in motion. If, as it sometimes happened, the horse was disposed to lengthen out these breathing-times rather unreasonably, it was admonished by one or two tugs at the halter, and a "Pull, Croppy, pull!"

One day that Thomas was bringing home a load, he stopped when he came near the door of his hut, and called out as usual, "Eppie, come and help me to coup!" His wife, thus summoned, came accordingly to assist in unloading; but when Thomas turned round for that purpose, there was nothing to be seen but his venerable white horse standing peacefully behind him; the load he had piled up at the peathill was gone; the vehicle he had piled it in was gone too. This to the reader may appear strange—and so it was, no doubt; but Thomas understood at once how the case stood; the fairies, he knew well, were playing a prank with him, and had cast glamour in his eyes; and, in order to confound him more, had left all other things visible, while they concealed the sled from his sight. It often happens, however, that no more than one person is bewitched at one time in this way; and Thomas made no doubt that the sled, though not discernible by him, was in its proper place, and palpable to his wife's organs. He therefore saw no use it would serve to make an ado about so simple a matter; and walking round to the place where the sled should have been, he desired his wife to lift out the one hook while he lifted out the other, that the horse might go at liberty till the sled should be emptied. An idea similar to that which had occurred to the husband struck his wife also; namely, that her eyes were under a spell; and she passed her hand across them, without moving from the spot on which she stood. Finding that this operation did not help her vision any thing, she was compelled to say, but with some hesitation, "Really, Thomas, I canna just say that I see the sled."

"Ye canna say that ye see't, can ye no?" said Thomas, groping in the empty space, evidently afraid that he should knock his shins against something. "An that be the case, I canna say that I see it clearly myself."

Comparing notes, the couple now agreed that it was most advisable to let the good folks of Faery finish their frolic; and that, if they themselves adjourned to their mid-day repast (for it was about the hollow and hungry hour of noon), it was highly probable the charm would be dissipated on their return, and the load of turf restored to its place, visible as well as tangible. The careful peasant observed, however, that it would be an awkward thing if the horse should go picking of grass among the knolls, overturn the load, and perhaps break the sled in some inconvenient spot. To prevent this, he tied the halter to the door-post; and then both went into the house together.

The pair cautiously abstained from showing any signs of impatience, or even curiosity, knowing that any thing of that kind would only tempt their tormentors to prolong the delusion. Not even a peep from the window was indulged; but, in return for this exemplary submission, they fully expected to find all as it should be when the time for resuming the business of the day came. The time did come; but it did not bring the realization of their expectations. The horse, which they had left tied to the door-post, was still there, and stood patiently with its head dropped from the accustomed horizontal level, and one of its hind feet lifted a little way from the ground; but no sled nor peats appeared. Thomas did not rest satisfied with appearances; he knew how deceitful these often are, and, repeating the proverb, that "seeing's believing, but feeling's the truth," he made assurance doubly sure, by cautiously groping all about the spot which the vehicle should have occupied.

He did murmur a little on finding that the case was hopeless. "Granting that the creatures had porridge to make, and pots to boil," he said, "and did need fires in the winter season, to be sure they must have fuel, and he would not have grudged them the peats—no, nor twice as many; but to take the bit sled too! It was probable the wasterful things would just break it up for firewood, and it would take him a week to make a new one—that is, it would have taken him so long if he had had wood for the purpose, but he had used the last spar about the house to mend the handbarrow the week before." He went on with these melancholy reflections—"Winter was coming on, and the greater part of the peats were out on the hill. It was true, his wife and himself might sit in the nook, and try to keep their fingers warm by blowing on them; yet what method they were to fall upon to make the water boil for their porridge, he did not pretend to be able to discover." In this mood he unharnessed the horse, and ordered his wife to carry the furniture within doors beside Christian folk—though, he added, it was indeed of small value, now that the sled was gone. He turned the horse to grass, and, being greatly chagrined, sat him down, and spoke more disrespectfully of the "folk in green" all the evening than ever he had ventured to do before. According to his view, such conduct was far from being creditable to them; for, though he had shown a willingness to acknowledge their power, and to bear a harmless joke at their hands, they had done him a serious mischief. This, he knew, was quite contrary to their usual practice; for, though freakish, they are not malicious, and if their frolics are patiently submitted to, it commonly procures for the prudent rustic a speedy cessation of them.

But if Thomas's despondency was for some time great, it happened shortly after, to his unspeakable satisfaction, that, being out on the hill to look after his flock, he discovered his sled, filled with peats, as he had loaded it, standing about half way on the road between the peat-hill and his house. He was at first chagrined at believing that the thing was real; for he argued, legitimately enough, that if the fairies had the power to prevent him from seeing what did exist, they might also be able to make things appear which were not; and the malicious spirit which they had already displayed led him to suspect that their persecution was not at end. Having satisfied himself, however, by repeated inspection and handling, that it actually was his lost sled which he now saw and grasped, he determined not to trust it again out of his sight, and, having unloaded it, drew it home with great labour, and then called his wife to watch it, whilst he ran to put the horse in yoke.

It was now that he repented of the harsh expressions he had lately used towards the "good neighbours." "They had played him a foul plisky," he said, "but not so bad as he once thought it, and he had spoken over rashly against them." He thought it best, however, to place as little confidence as possible in them for the future. It is supposed that the eye of a Christian person can protect any thing it is fixed upon from being made the sport or the prey of these little mischievous imps; thus, if the nurses watch a child with sufficient care, there is no danger of its being stolen: and Thomas determined to make use of this same precaution for the preservation of his sled. The idea of keeping an eye upon it, himself, however, while travelling to and from the peat hill, was one that never entered his head. A modern driver would have found no difficulty in keeping his vehicle in sight at the same time that he managed the horse; but Thomas considered the assistance he rendered, and the example he showed by tugging at the extremity of the halter, to be indispensable—and therefore he proposed that his wife should accompany him and keep up the necessary degree of surveillance. Still the couple did not avow the fears which led to this course; that would have been to forepeak the ill they dreaded. But the husband said he had observed that the sled, in descending any steep part of the road, rushed upon the heels of his horse, which, thus assailed, was apt to leap hastily forward, to the great risk of being overturned, and doing him some injury. He therefore conceived that it would be advantageous to have a person who might prevent this by pulling backwards; and his wife, who had been no less alarmed than himself at the thought of blowing her fingers in a cold corner through winter, readily acquiesced in this arrangement.

Thomas related the whole circumstances of this affair to the minister of the parish some time after they occurred. That worthy man listened attentively to the full detail, and then proceeded, with his habitual solemnity of manner, to remark, that with respect to the existence of ghosts, guardian angels, and other beings of a purely spiritual nature, he was not called upon on the present occasion to make any observations. The question before him, he said, was in regard to fairies. Now, these creatures were sometimes accounted to possess corporeal faculties, and sometimes the popular belief attributed to them feats such as could be performed only by ethereal essences, which involved a *reductio ad absurdum*; for how could matter become immaterial, and *vice versa*?

For this reason, he had no hesitation in giving it as his opinion that no such beings as fairies existed; and therefore they could neither feloniously nor *per ludibrium*, abstract, or withdraw in any manner, any goods or property of any description. In explanation of the particular case now submitted to him, he suggested that the hooks which fastened the chains to the sled might have slipped out by some accident, and the thing never have been observed, as Thomas acknowledged that it was his practice to continue his way without once looking behind him. Our shepherd, however, by no means agreed either to the argument for non-existence of fairies, or to the solution which the minister gave regarding the temporary abstraction of his sledge. "It wadna do," he said, "for learned men to confess the truth of sic cantrips, and they needs must say something against it. But the thing was as clear as day."

Column for Naturalists.

BIRDS OF SOUTH AMERICA.

THOUGH least in size, the glittering mantle of the humming-bird entitles it to the first place in the list of the new world. It may truly be called the bird of Paradise; and had it existed in the old world, would have claimed the title, instead of the bird which has now the honour to bear it. See it darting through the air, almost as quick as thought!—now it is within a yard of your fire!—in an instant it is gone!—now it flutters from flower to flower to sip the silver dew—it is now a ruby—now a topaz—now an emerald—now all burnished gold. Cayenne and Demerara produce the same humming-birds. Perhaps you would wish to know something of their haunts. Chiefly in the months of July and August the tree called Bois Immortel, very common in Demerara, bears abundance of red blossom, which stays on the trees some weeks; then it is that most of the humming-birds are very plentiful. The wild red sage also their favourite shrub, and they buzz like bees round the blossom of the Wallaba tree. Indeed, there is scarce a flower in the interior or on the sea-coast, but what receives frequent visits from one or other of the species. On entering the forest on the rising land in the interior, the blue and green, the smallest brown, no bigger than the humble bee, with two long feathers in the tail, are to be seen. As you advance towards the mountains of Demerara, other species of humming-birds present themselves. It seems to be an erroneous opinion that the humming-bird lives entirely on the honey-dew. Almost every flower of the tropical climates contains insects of one kind or other; now the humming-bird is most busy about the flowers an hour or two before sunrise, and after a shower of rain; and it is just at this time that the insects come out to the edge of the flower, in order that the sun's rays may dry the nocturnal dew and rain which they have received. On opening the stomach of the humming-bird, dead insects are found there.

Next to the humming-birds, the cotingas display the gayest plumage. They are of five species. Perhaps the scarlet cotinga is the richest of the five, and is one of those birds which are found in the deepest recesses of the forest. His crown is flaming red; to this abruptly succeeds a dark shining brown, reaching half way down the back; the remainder of the back, the rump, and tail, the extremity of which is edged with black, are a lovely red; the belly is somewhat lighter red; the breast reddish black; the wings brown. He has no song, is solitary, and utters a monotonous whistle which sounds like "quet." He is fond of the seeds of the hitia tree, and those of the silo-boli trees. The purple-throated cotinga has black wings, and every other part a light and glossy blue, save the throat, which is purple. The pompadour cotinga is entirely purple, except his wings, which are white, their first five feathers tipped with brown. The fifth species is the celebrated campanero of the Spaniards, called darya by the Indians, and bell-bird by the English. He is about the size of the jay. His plumage is white as snow. On his forehead rises a spiral tube nearly three inches long. It is jet black, dotted all over with small white feathers. It has a communication with the palate, and, when filled with air, looks like a spire; when empty, it becomes pendulous. His note is loud and clear, like the sound of a bell, and may be heard at the distance of three miles. In the midst of these extensive wilds, generally on the dried top of an aged mora, almost out of gun reach, you will see the campaneros. No sound or song from any of the winged inhabitants of the forest, not even the clearly pronounced "whip-poor-wills" from the goat-sucker, cause such astonishment as the toll of the campanero. With many of the feathered race, he pays the tribute of a morning and evening song, and even when the meridian sun has shut in silence the mouth of almost the whole of animated nature, the campanero still cheers the forest. You hear his toll, and then a pause again, and then a toll again, and again a pause. Then he is silent for six or eight minutes, and then another toll, and so on. He is never seen to feed with the other cotingas, nor is it known in what part of Guiana he makes his nest.

Whilst the cotingas attract your attention by their superior plumage, the singular form of the toucan makes a lasting impression on your memory. There are three species of toucans in Demerara, and three diminutives, which may be called toucanets. The largest of the first species frequents the mangrove trees on the sea-coast. He is never seen in the interior till you reach Macoussia, where he is found in the neighbourhood of the river Tacoutire. The other two species are very common. They feed entirely on the fruits of the forest, and, though of the pie kind, never kill the young of other birds, or touch carrion. They are very noisy in rainy weather. The sound which the bouradi or the larger makes, is like the clear yelping of a puppy dog, and you fancy he says "pia-po-o-co," and thus the South American Spaniards call him piapoco. All the toucanets feed on the same trees on which the toucan feeds, and every species of this family, of enormous bill, lays its eggs in the hollow trees. They are social, but not gregarious. You may sometimes see eight or ten in company, and from this you may suppose they are gregarious; but upon closer examination, you will find it has only been a dinner party, which breaks up and disperses towards roosting time. The flight of the toucan is by jerks; in the action of flying it seems incommoded by its huge disproportioned bill; if the extraordinary form and size of the bill expose the toucan to ridicule, its colours make it amends.

The houtou ranks high in beauty amongst the birds of Deme-

rara; his whole body is green, with a bluish cast in the wings and tail; his crane, which he erects at pleasure, consists of black in the centre, surrounded with lovely blue of two different shades; he has a triangular black spot, edged with blue, behind the eye, extending to the ear; and on his breast a sable tuft, consisting of nine feathers edged also with blue. This bird seems to suppose that its beauty can be increased by trimming the tail, which undergoes the same operation as our hair in a barber's shop, only with this difference, that it uses its own beak, which is serrated, in lieu of a pair of scissors; as soon as his tail is full grown, he begins about an inch from the extremity of the two largest feathers in it, and cuts away the web on both sides of the shaft, making a gap about an inch long. Both male and female Adonise their tails in this manner, which gives them a remarkable appearance amongst other birds. The thick and gloomy forests are the places preferred by the houtou. In those far-extending wilds, about day-break, you hear him articulate, in a distinct and mournful tone, "houtou, houtou." Move cautiously on where the sound proceeds from, and you will see him sitting in the underwood, and very rarely is he seen in the lofty trees, except the bastard silo-boli tree, the fruit of which is grateful to him. He makes no nest, but rears his young in a hole in the sand, generally on the side of a hill.

The cassique, in size, is larger than the starling; he covets the society of man, but disdains to live by his labours. When nature calls for support, he repairs to the neighbouring forest, and there partakes of the store of fruits and seeds which she has produced in abundance for her aerial tribes. When his repast is over, he returns to man, and pays the little tribute which he owes him for his protection; he takes his station on a tree close to his house, and there for hours together pours forth a succession of imitative notes. His own song is sweet, but very short. If a toucan be yelping in the neighbourhood, he drops it, and imitates him. Then he will amuse his protector with the cries of different species of the woodpecker; and when the sheep bleat, he will distinctly imitate them. Then comes his own song again, and if a puppy dog or a guinea fowl interrupt him, he takes them off admirably; and by his different gestures during the time, you would conclude that he enjoys the sport. The cassique is gregarious, and imitates any sound he hears with such exactness, that he goes by no other name than that of mocking-bird amongst the colonists. At breeding time, a number of these pretty choirists resort to a tree near the planter's house, and from its outside branches weave their pendulous nests. So conscious do they seem that they never give offence, and so little suspicious are they of receiving any injury from man, that they will choose a tree within forty yards from his house, and occupy the branches so low down that he may peep into the nests. The proportions of the cassique are so fine, that he may be said to be a model of symmetry in ornithology. On each wing he has a bright yellow spot, and his rump, belly, and half the tail, are of the same colour. All the rest of the body is black. His beak is the colour of sulphur, but it fades in death, and requires the same operation as the bill of the toucan to make it keep its colours.

You would not be long in the forests of Demerara without noticing the woodpeckers. You may meet with them feeding at all hours of the day. Well may they do so. Were they to follow the example of most of the other birds, and only feed in the morning and evening, they would be often on short allowance, for they sometimes have to labour three or four hours at the tree before they get at the food. The sound which the largest kind makes in hammering against the bark of the tree, is so loud, that you would never suppose it to proceed from the efforts of a bird. You would take it to be the woodman, with his axe, trying, by a sturdy blow often repeated, whether the tree was sound or not. There are fourteen species here; the largest the size of a magpie, the smallest not bigger than the wren. They are all beautiful, and the greater part of them have their heads ornamented with a fine crest, moveable at pleasure. It is said if you once give a dog a bad name, whether innocent or guilty, he never loses it. It sticks close to him wherever he goes. He has many a kick and many a blow to bear on account of it, and there is nobody to stand up for him. The woodpecker is little better off. The proprietors of woods in Europe have long accused him of injuring their timber, by boring holes in it, and letting in the water, which soon rots it. The colonists in America have the same complaints against him. Had he the power of speech, he could soon make a defence. "Mighty lords of the woods," he would say to man, "why do you wrongfully accuse me? Why do you hunt me up and down to death for an imaginary offence? I have never spoiled a leaf of your property, much less your wood. Your merciless shot strikes me at the very time I am doing you a service. But your shortsightedness will not let you see it, or your pride is above examining closely the actions of so insignificant a little bird as I am. If there be that spark of feeling in your breast, which they say man possesses, or ought to possess, above all other animals, do a poor injured creature a little kindness, and watch me in your woods only for one day. I never worried your healthy trees. I should perish for want in the attempt. The sound bark would easily resist the force of my bill; and were I even to pierce through it, there would be nothing inside that I could fancy, or my stomach digest. I often visit them, it is true, but a knock or two convinces me that I must go elsewhere for support; and were you to listen attentively to the sound which my bill causes, you would know whether I am upon a healthy or an unhealthy tree. Wood and bark are not my food. I live entirely upon the insects which have already formed a lodgement in the distempered tree. When the sound informs me that my prey is there, I labour for hours together till I get at it; and, by consuming it, for my own support, I prevent its further depredations in that part. Thus I discover for your hidden and unsuspected foe, which has been devouring your wood in such secrecy, that you had not the least suspicion it was there. The hole which I make, in order to get at the pernicious vermin, will be seen by you as you pass under the tree. I leave it as a signal to tell you, that your tree has already stood too long. It is past its prime. Millions of insects, engendered by disease, are preying upon its vitals; ere long it will fall a log in useless ruins. Warned by this loss, cut down the rest in time, and spare, O spare, the unoffending woodpecker."—*Wanderings of Charles Waterton in South America.*

PRICE THREE HALFPENCE.

GENERAL INVITATIONS.

"PRAY, do call in an easy way some evening, you and Mrs Balderstone: we are sure to be at home, and shall be most happy to see you." Such is the kind invitation one is apt to get from considerably intimate acquaintances, who, equally resolved against the formality and the expense of a particular entertainment on your account, hope to avoid both evils by making your visit a matter of accident. If you be a man of some experience, you will know that all such attempts to make bread and cheese do that which is more properly the business of a pair of fowls, end in disappointment; and you will, therefore, take care to wait till the general invitation becomes a particular one. But there are inexperienced people in this world who think every thing as it seems, and are apt to be greatly deceived regarding this accidental mode of visiting. For the sake of these last, I shall relate the following adventure:—

I had been remarkably busy one summer, and, consequently, obliged to refuse all kinds of invitations, general and particular. The kind wishes of my friends had accumulated upon me somewhat after the manner of the tunes frozen up in Baron Munchausen's French horn; and it seemed as if a whole month would have been necessary to thaw out and discharge the whole of these obligations. A beginning, however, is always something; and, accordingly, one rather splashy evening in November, I can't tell how it was, but a desire came simultaneously over myself and Mrs Balderstone—it seemed to be by sympathy—of stepping out to see Mr and Mrs Currie, a married pair, who had been considerably more pressing in their general invitations than any other of our friends. We both knew that there was a cold duck in the house, besides a bit of cheese just sent home by Nicholson, and understood to be more than excellent. But, as the old Scots song says, the *tid* had come over us, and forth we must go. No sooner said than done. Five minutes more saw us leaving our comfortable home, my wife carrying a cap pinned under her cloak, while to my pocket was consigned her umbrageous comb. As we paced along, we speculated only on the pleasure which we should give to our friends by thus at last paying them a visit, when perhaps all hope of our ever doing so was dead within them. Nor was it possible altogether to omit reflecting, like the dog invited by his friend to sup, upon the entertainment which lay before us; for certainly on such an occasion the fatted calf could hardly expect to be spared.

Full of the satisfaction which we were to give and receive, we were fully into the house before we thought it necessary to inquire if any body was at home. The servant girl, surprised by the forward confidence of our *entrée*, evidently forgot her duty, and acknowledged, when she should have denied, the presence of her master and mistress in the house. We were shown into a dining-room as clean, cold, and stately as an alabaster cave, and which had the appearance of being but rarely lighted by the blaze of hospitality. My first impulse was to relieve my pocket, before sitting down, of the comb, which I thought was now about being put to its proper use; but the chill of the room stayed my hand. I observed, at the same time, that my wife, like the man under the influence of Eolus in the fable, manifested no symptom of parting with her cloak. Ere we could communicate our mutual sensations of incipient disappointment, Mrs Currie entered with a flurried surprised air, and made a prodigious effort to give us welcome. But, alas! poor Mr Currie; he had been seized in the afternoon with a strange vertigo and sickness, and was now endeavouring, by the advice of Dr Boak, to get some repose.

"It will be such a disappointment to him when he learns that you were here, for he would have been so happy to see you. We must just entertain the hope, however, to see you some other night." Although the primary idea in our minds at this moment was unquestionably the *desperatio cibi*—the utter hopelessness of supper in this quarter—we betrayed, of course, no feeling but sympathy in the illness of our unfortunate friend, and a regret for having called at so inauspicious a moment. Had any unconcerned person witnessed our protestations, he could have formed no suspicion that we ever contemplated supper, or were now in the least disappointed. We felt anxious about nothing but to relieve Mrs Currie, as soon as possible, of the inconvenience of our visit, more especially as the chill of the room was now piercing us to the bone. We therefore retired, under a shower of mutual compliments, and condolences, and "hopes," and "sorries," and "have the pleasures;" the door at last slamming after us with a noise which seemed to say, "How very glad I am to get quit of you!"

When we got to the street, we certainly did not feel quite so mortified as the dog already alluded to, seeing that we had not, like him, been tossed over the window. But still the reverse of prospect was so very bitter, that for some time we could hardly believe that the adventure was real. By this time we had expected to be seated snug at supper, side by side with two friends, who, we anticipated, would almost expire with pleasure at seeing us. But here, on the contrary, we were turned out upon the cold inhospitable street, without a friend's face to cheer us. We still recollected that the cold duck remained as a fortress to fall back upon; but, being now fairly agog in the adventure, the idea of returning home, *re infecta*, was not to be thought of. Supper we must have in some other house than our own, let it cost what it may. "Well," said Mrs Balderstone, "there are the Jacksons! They live not far from this—suppose we drop in upon them. I'm sure we have had enough of invitations to their house." The very last time I met Mrs Jackson on the street, she told me she was never going to ask us again—we had refused so long—she was going, she said, just to let us come if we liked, and *when we liked*. Off we went, therefore, to try the Jacksons.

On applying at the door of this house, it flew open, as it were by enchantment, and the servant girl, so far from hesitating like the other, seemed to expect no question to be asked on *entrée*. We moved into the lobby, and inquired if Mr and Mrs Jackson were at home, which was answered by the girl with a surprised affirmative. We now perceived, from the pile of hats and cloaks in the lobby, as well as a humming noise from one of the rooms, that the Jacksons had a large company, and that we were understood by the servant to be part of it. The Jacksons thought we (I know my wife thought so, although I never asked,) give some people particular invitations. Her object was now to make an honourable retreat, for, although my dress was not entirely a walking one, and my wife's cap was brought with the prospect of making an appearance of dress, we were by no means fit to match with those who had dressed on purpose for the party, even although we were asked to join them. Just at this moment, Mrs Jackson happened to cross the lobby, on hospitable thoughts intent, and saw us, than whom, perhaps, she would rather have seen a basilisk. "Oh, Mrs Balderstone, how do you do? How are you, Mr Balderstone? I'm so delighted that you have come in this easy way at last. A few of the neighbours have just dropped in upon us, and it will be so delightful if you will join them. Come

into this room and take off your bonnet, and, you, Mr Balderstone, just you be so good as step up to the drawing-room. You'll find numbers there that you know. And Mr Jackson will be so happy to see you." All this, however, would not do. Mrs Balderstone and I not only felt a little hurt at the want of speciality in our invitations to this house, but could not endure the idea of mingling in a crowd better dressed and more regularly invited than ourselves. We therefore begged Mrs Jackson to excuse us for this night. We had just called in an easy way in passing, and, indeed, we never attended ceremonious parties at any time. We would see her some other evening, when she was less engaged—that is to say, "we would rather see you and Mr Jackson at Jericho than darken your doors again." And so off we came, with the blandest and most complimentary language upon our tongues, and the most piqued and scornful feelings in our hearts.

Again upon the street—yea, once again. What was to be done now? Why, said Mrs Balderstone, there is excellent old Mrs Smiles, who lives in the next street. I have not seen her or the Misses Smiles for six months; but the last time they were so pressing for us to return their visit (you remember they supped with us in the spring), that I think we cannot do better than take this opportunity of clearing scores.

Mrs Smiles, a respectable widow, lived with her five daughters in a third floor in — Street. Thither we marched, with a hope, undiminished by the two preceding disappointments, that here at length we would find supper. Our knock at Mrs Smiles' hospitable portal produced a strange rushing noise within, and when the servant appeared, I observed in the far, dim vista of the passage, one or two slip-slop figures darting across out of one door into another, and others again crossing in the opposite direction, and then there was heard a low anxious whispering, while a single dishevelled head peeped out from one of the doors, and then the head was withdrawn, and all was still. We were introduced into a room which had evidently been the scene of some recent turmoil of no ordinary kind, for female clothes lay scattered in every direction, besides some articles which more properly belong to a dressing room. We had not been here above a minute when we heard our advent announced by the servant in an adjoining apartment to Mrs Smiles herself, and some of her young ladies. A flow of obloquy was instantly opened upon the girl by one of her young mistresses—Miss Eliza, we thought—for having given admission to any body at this late hour, especially when she knew that they were to be early up next morning to commence their journey, and had still a great many of their things to pack. "And such a room you have shown them into, you goose!" said the enraged Miss. The girl was questioned as to our appearance, for she had neglected to ask our name; and then we heard one young lady say, "It must be these Balderstones. What can have set them agad-ding to-night? I suppose we must ask them to stay to supper, for they'll have come for nothing else—confound them! Mary, you are in best trim; will you go in and speak to them till we get ourselves ready? The cold meat will do, with a few eggs. I'm sure they could not have come at a worse time." Miss Mary accordingly came hastily in after a few minutes, and received us with a thousand protestations of welcome. Her mother would be so truly delighted to see us, for she had fairly given up all hope of our ever visiting her again. She was just getting ready, and would be here immediately. "In the meantime, Mrs Balderstone, you will lay by your cloak and bonnet. Let me assist you," &c. We had got enough, however,

of the Smileses. We saw that we had dropped into the midst of a scene of easy dishabille, and surprised it with unexpected ceremony. It would have been cruel to the Smileses to put them about at such a time, and ten times more cruel to ourselves to sit in friendly intercourse with a family who had treated us in such a manner behind our backs. "These Balderstones!" The phrase was wormwood. My wife, therefore, made up a story to the effect that we had only called in going home from another friend's house, in order to inquire after the character of a servant. As Mrs Smiles was out of order, we would not disturb her that evening, but call on some other occasion. Of course, the more that we declaimed about the impossibility of remaining to supper, the more earnestly did Miss Smiles entreat us to remain. It would be such a disappointment to her mother, and still more to Eliza and the rest of them. She was obliged, however, with well-affecting reluctance, to give way to our impetuous desire of escaping.

Having once more stepped forth into the cold blast of November, we began to feel that supper was becoming a thing which we could not much longer, with comfort, trust to the contingency of general invitations. We therefore sent home our thoughts to the excellent cold duck and green cheese which lay in our larder, and, picturing to ourselves the comfort of our parlour fireside, with a good bottle of ale toasting within the fender, resolved no more to wander abroad in search of happiness, unless there should be something like a certainty of good fare and a hearty welcome elsewhere.

Thus it is always with general invitations. "Do call on us some evening, Miss Duncan, just in an easy way, and, pray, bring your seam with you, for there is nothing I hate so much as ceremonious set calls," is the sort of invitations you will hear in the middle ranks of life, given to some good-natured female acquaintance, while you yourself, if a bachelor, will in the same way be bidden to call "just after you are done with business, and any night in the week; it is all the same, for you can never catch us unprepared." The deuce is in these general invitations. People give them without reflecting that they cannot be at all times ready to entertain visitors; cannot be so much as at home to have the chance of doing so. Other people accept and act upon them, at the risk of either putting their visitors dreadfully about, or receiving a very poor entertainment. The sudden arrival of an unexpected guest who has come on the faith of one of these delusive roving invitations, indeed, in many instances, disorganises the economy of a whole household. Nothing tries a housewife so much. The state of her larder or cupboard instantaneously flashes on her mind; and if she do not happen to be a notable, and, consequently not a regular carver of beef, or curious in the matter of fresh eggs, a hundred to one but she feels herself in an awkward dilemma, and, I have no doubt, would wish the visitor any where but where he is. The truth is, by these general invitations you may chance to arrive at a death or a marriage, a period of mourning or rejoicing, when the sympathies of the family are all engaged with matters of their own.

If people will have their friends beside them, let them, for the sake of all that is comfortable, give them a definite invitation at once; a general invitation is much worse than no invitation at all; it is little else than an insult, however unintentional; for it is as much as to say that the person is not worth inviting in a regular manner. In "good" society, a conventional understanding obtains in the delicate point of invitations; there is an established scale of the value of the different meals adapted to the rank of the invited. I advise all my friends to follow this invaluable code of civility. By all means let your invitations have a special reference to time. On the other hand, if a friend comes down with a request that you will favour him with your company at a certain hour of the day, why, go without hesitation. The man deserves your company for his honesty, and you will be sure to put him to no more trouble than what he directly calculates on. But turn a deaf ear, if you be wise, to general invitations; they are nets spread out to ensnare your comfort. Rather content yourself with the good old maxim, which somebody has inscribed over an ancient doorway in one of the old streets of Edinburgh, *TECUM HABITA—Keep at Home.*

POPULAR INFORMATION ON SCIENCE.

LIGHT.

In the Mosaic account of the creation of the world we read, that in the beginning the earth was without form and void, and darkness was upon the face of the deep, and the spirit of God moved upon the face of the waters. Amidst this solemn and mysterious gloom, God said let there be light, and there was light. The instantaneous fulfilment of the divine command; the sudden transition from the awful dreariness of darkness into the bright effulgence of light; the change presented over the whole aspect of the new illumined mass of waters, must fill every contemplative mind with a sense of power and sublimity which cannot be exceeded. Thus was light, so pure in its nature, and so beautiful in all its varied operations, suddenly summoned into existence; and when we consider its universal diffusion, and the blessings it scatters around us, we cannot feel surprised that it has claimed the attention of the most highly gifted and accomplished philosophers. Let us then enter on this subject, which is not one of an abstract and uninviting character, but rather one of the most animating and surpassing interest; let us then proceed to consider its sources, its nature and properties, and its effect on the animate and inanimate creation.

The sun, which has been adored as a visible God by many nations, is the most obvious source of light and heat; and every body is aware that it is the change of position which our earth, in its constant revolution, undergoes in its relation to that luminary, which causes and regulates the return and duration of day and night, and the succession and intensity of the different seasons. But the sun is not the only source of light; for, were

this the case, we should be left during the period of night in the helplessness of darkness, than which nothing can be more terrible. Instead of this, when he has sunk below the horizon, and the twilight which follows has faded away, the reflected light of the moon, and the light of innumerable stars, shed a soft and beamy radiance through the world. These heavenly bodies are the most obvious sources of natural light; but man, at a very early period, prompted by his necessities, learned to procure both light and heat artificially, to accomplish which he had recourse to various ingenious methods. It was observed, that when two bodies are rubbed pretty smartly against each other, both light and heat are evolved—thus it is obtained by friction. The artie Highlanders of Baffin's Bay obtain fire by rubbing two fish bones against each other. The Fuegians, an uncivilized race of people, inhabiting one of the coasts in the Southern Ocean, procure fire, says Captain Weddell, by rubbing iron pyrites (a combination of iron and sulphur which occurs native) and a flinty stone together, and catching the sparks on a dry substance resembling moss, which is quickly ignited. The inhabitants of New Holland take two pieces of soft dry wood; the one a stick about eight or nine inches long, the other a flat piece. The stick they shape into an obtuse point at one end, and, pressing it against the other, turn it quickly round, holding it between both their hands as we might a chocolate mill. By this method, light and heat are obtained in less than two minutes. Some American tribes, as in Kamschatka, have a machine on this principle. It is for this reason necessary to grease the iron at the axis of coach wheels, as, otherwise, from the friction, when the carriage is dragged swiftly along, they are apt to take fire—an accident which not unfrequently occurs. So likewise when the air has been very dry, even the boughs of forest trees rubbed against each other by the wind have been known to take fire. Friction, therefore, is one of the sources of artificial light. When, instead of persevering in the motion we have described, one body is struck quickly and forcibly against another, as a piece of flint against a piece of iron, light and heat are likewise produced. In this case, some particles of the metal are struck away from the mass, and so violent is the heat produced, that it melts them, and these, falling into the dry tinder usually used in this country, ignite the match that is applied to them. This is the method of producing light and heat by percussion; and we all know it is taken advantage of in the flint-locks of guns and pistols. When fire has been thus produced, we apply it to an inflammable body, during the combustion or burning of which a more or less intense light is emitted. Thus oil and tallow are inflammable substances, and, by immersing in either of these a wick or piece of cotton, in a certain manner, the oil or melted tallow, on lighting the wick, rises through its interstices, is consumed, and gives rise to a steady flame. So likewise many gases are inflammable, and, when mixed together in certain quantities, consume more or less rapidly.

Light is also produced by electricity, which is a very peculiar and subtle fluid, that seems to pervade more or less all bodies, inanimate as well as animate. When this electric fluid has accumulated in any particular region, it seeks to disperse or equalise itself, and, in so doing, evolves itself, and becomes perceptible to our sight. This is the cause of lightning, and some likewise think it is the cause of the aurora borealis, meteors, shooting stars, and many other interesting phenomena in nature. Certain animals also have the power of secreting or generating a phosphorescent kind of matter, which gives out light, examples of which we find in the glow-worm, the fire-fly of the West Indies, and some kinds of fish. It is probable that sea-water is capable of dissolving this luminous matter, which explains the reason why the waters of the ocean by night often appear luminous when agitated. Such are the general sources of light. But the most obvious and constant of them all is evidently the sun.

The human mind, naturally inquisitive, is next led to ask what is the nature of this light which is so universally diffused, and what are its properties; nor have these subjects remained uninvestigated. It was the opinion of the celebrated philosopher, Descartes, that light is caused by a certain motion or undulation of a very thin elastic medium, which he supposed pervaded space; but Sir Isaac Newton, whose discoveries established a new era in the history of science, rejected this doctrine, and, from numerous observations, came to the conclusion that light consists of very minute particles of matter, which are emitted in all directions from luminous bodies. The opinion of Descartes was afterwards advocated by many men eminent in science; but that of Sir Isaac Newton appears better founded, and is consequently more generally accepted. The particles of light are extremely small; nay, so exquisitely minute, that they do not affect the most delicate balance; but we must recollect, that as objects exist of such extreme minuteness as to escape even the powers of the microscope, so also matter exists of so subtle a nature as not to affect any scale we have yet constructed. This is the case with the matter of heat, and also with that of electricity. We may weigh, perhaps, the thousandth part of a grain; but, says Dr Thomson, we are certain that no particle of light weighs one millionth millionth part of a grain. This exquisite minuteness of the particles of light enables them to enter freely into the eye, without inflicting any injury on the structure of so delicate an organ. Admirable indeed is the adaptation of every arrangement of nature to fulfil its final end or purpose. The number of these particles which flow from every luminous body is also wonderful. It has been computed that there flow more than six million million times as many particles of light from a candle in one second of time as there are grains of sand in the whole earth. Be this as it may, the particles of light from a single candle, if there be no obstacle in their way to obstruct their passage, will fill a space of two miles distance in every direction. The velocity with which light travels has equally excited the wonder and

admiration of every intelligent mind. The sun is above ninety millions of miles distant from our earth, yet its light reaches us in about seven minutes and a half. Dr Brewster remarks, that it moves at the rate of a hundred and ninety-two thousand five hundred miles in a second. But while we pause on this surprising velocity, it may be well to remember that all our notions of distance and time are merely comparative, and in this, as in many other instances, our ideas are confined to the limits of our own feeble and narrow experience. We know that the fleetest racer can scarcely ever run more than a mile a minute, nor can he support this speed more than five or six minutes; but the swallow does this with pleasure for nine or ten hours a-day. The golden eagle will wing its way through the fiercest storm at the rate of forty miles an hour; and Spallanzani has affirmed that one of our smallest birds, the little swift, travels at the rate of two hundred and fifty miles an hour. We know from experiment that sound travels eleven hundred and forty feet in a second, and in all these instances the rapidity of motion is almost incredible, but we must never allow our scepticism to be excited by what at first sight appears to be beyond the range of possibility. A stream of these particles of light proceeding from the sun, or any luminous body, constitutes what is called a ray of light, which at all times proceeds, so long as it meets with no interruption, in a straight line. Thus we can see through a straight, but not through a bent tube. In aiming with a gun or arrow at the bull's eye in the centre of a target, the effort we make is to direct the projectile along the straight rays of light which proceed from that point to our organ of vision, for which reason, to take a surer and more successful aim, we often close one eye in order to exclude all the rays of light excepting those which proceed from the point to which the attention is directed. Accordingly, we say that a ray of light moves in a straight line; but if it meet with a body, such as a glass mirror, that interrupts its progress, what happens? It is unable to proceed directly onwards, and is reflected out of its course as a marble is when struck against a wall. This is what is called the reflection of light. On a bright summer's day, when the sun is shining on the bosom of a lake or river, its rays of light are thus turned or reflected back to the eye, with a lustre so dazzling as to be often intolerable. So likewise in walking on the sunny side of the street, the reflection of the rays from the pavement and houses dazzles the sight, and induces us to seek the shade. On the sandy deserts of Africa and Egypt, this continued reflection of the rays of light, from the particles of sand, gives rise to dreadful and painful maladies of the organ of sight. It is for the same reason that when we walk out after a fall of snow, if the noonday sun shine brightly, the many rays that are reflected from the snow around excite a painful sensation in the eyes. Travellers who have visited the northern latitudes have complained much of the annoyance they had to endure from this reflection of light from the snow and ice which perpetually exist in those dreary and desolate regions. The Esquimaux are not even by habit reconciled to this inconvenience, but are subjected to inflammation and other diseases of the eyes. Many persons, says Captain Lyon, had lost their eye-lashes, and were nearly blind. A very curious kind of wooden eye-shade is worn by them, and so contrived as to admit but little of the light that is reflected from the ice. But if such be the painful consequence of the reflection of the sun's rays, how comes it that we do not ourselves experience more annoyance from this cause? The reason is this—that while certain bodies do reflect all the sunlight, others take up or absorb it in a considerable quantity, so that only a part of it is reflected. Thus a soft dark earthy soil allows the rays of light to enter into it, and they there remain retained. It is this power which certain bodies have of absorbing light, that prevents our having to walk through a world in which we should otherwise be continually dazzled.

We have thus far spoken very generally of the reflection and absorption of light; now let us consider another very interesting property it possesses, and which gives rise to some of the most curious and beautiful appearances in nature. When a ray of light proceeds through the same medium, we will say the air, it moves in a straight line, and if admitted through a hole in a shutter into a dark room, appears white; but if it passes obliquely from a rarer into a denser medium, as from air into water, it is then urged out of the straight line, and appears as if it had been suddenly bent. For this reason a straight rod or stick, when immersed in water, appears to be broken at the surface of the water; and the portion immersed seems to be bent upwards. The light thus proceeding out of its straight course is said to be refracted, and our observations on objects placed in water are liable from this circumstance to considerable deception. Thus—a deep-bodied fish seen near the surface of the water appears a flat fish; a round body there seems oval; and objects seen at the bottom of the water do not seem to be so deep as they really are, from which source of error, judging of the depth of a clear river from the bank, young persons have been often tempted beyond their depth, and drowned. Now, we must recollect that light, in passing into our atmosphere, has moved from a rarer into a denser medium—that is, from the thin ether above the highest stratum of air into the denser mass of air which more immediately surrounds the earth. This air is generally loaded with watery vapour, so that the medium through which light has to pass in our atmosphere undergoes many remarkable changes. Hence the distance, height and relative position of mountains, hills, valleys, towns, often appear altered. A certain range of mountains in one condition of the atmosphere will appear nearer; in another, more remote from the spectator than usual. But in being thus bent out of its course, a ray of light exhibits a variety of beautiful colours, the cause of which may easily be explained. We have already observed that if a ray of light be admitted through the hole of a shutter into a dark room, it appears of uniform whiteness; but Sir Isaac Newton discovered that this white ray of light is a combination of seven dif-

ferently coloured rays, which, by a triangular piece of glass called a prism, may be separated easily from each other. This illustrious philosopher proceeded thus: he made a hole in one of his window-shutters, and having darkened his chamber, let in a convenient quantity of the sun's light. He then intercepted this light with the triangular piece of glass, and found that in passing through the glass, the light was so refracted as to exhibit on the wall an image of seven different colours, viz. violet, indigo, blue, green, yellow, orange, red. "It was at first," says Sir Isaac, "a very pleasing diversion to view the vivid and intense colours produced thereby," and after varying his experiments in a most ingenious way, he established this very interesting fact, that every ray of white light consists of seven other primary and different coloured rays, each of which seven is more or less refrangible than the other. Sir Isaac Newton having obtained the seven different coloured rays, gathered them again together by the aid of a lens, and re-produced the white ray of light. Further, in corroboration of this, he mixed together one part of red lead, four parts of blue bise, and a proper proportion of orpiment and verdigris. This mixture was dun, like wood newly cut. He now took one-third of the mixture, and scattered it over the floor of his room, where the sun shone upon it through the open casement, and beside it, in the shadow, he laid a piece of white paper of the same size. Then going to the distance of twelve or eighteen feet, so that he could not discern the unevenness of the surface of the powder, nor the little shadows let fall from the gritty particles thereof, the powder appeared intensely white, so as to transcend even the paper itself in whiteness. Sir Isaac Newton's discovery, that the combination of these different coloured rays produced the white ray of light, and that each of these elementary or primary rays possessed its own specific degree of refrangibility, revealed to us at once the explanation of many of the most interesting appearances in nature. Nothing can be more beautiful than the colours with which the tops of mountains, the surface of the ocean, and the different shaped clouds, are tinged at sunrise and at sunset, the cause of which now became obvious. The white rays of the sun, entering into an atmosphere of varying density, pass through it like the sunbeam through Sir Isaac Newton's glass prism, and are in a similar way decomposed. The rays that are the least refracted or diverted out of their course, reach the earth in all the purity and beauty of their own individual colours, and enter into a thousand varied combinations. When the sun is shining in all its noon of splendour high above the horizon, its rays, falling on the wide expanse of the ocean, are reflected back unchanged in all their original silvery lustre; but when the sun is setting, and its rays fall obliquely on the waters, the red being the least refrangible of the primary rays, floods with a fiery glow the heaving billows, and the line of the visible horizon. Around the heavenly bodies—the sun and the moon—circles of light of the most varying colours often appear, which may be explained on the same principle, these halos being nothing more than the rays of light reflected and refracted by the globules of vapour through which they pass before they reach the sphere of our vision. But the most familiar instance of the decomposition of light into its prismatic colours is exhibited to us by the rainbow, which is occasioned by the light of the sun shining on the spherical drops of water falling in an opposite shower. In this instance the rays of white light are refracted or resolved into their primary rays, which are reflected in the form of an arch across the heavens. Sometimes more than one or two of these arches are formed. Captain Parry saw five rainbows, each at the same time complete. Sometimes the arches intersect each other, and they have been seen in an inverted position. Lunar rainbows also frequently occur, but do not display such variety of colours. Rainbows also often appear among the waves of the sea, when their heads or tops are buffeted by the wind, and blown into small drops. They appear, too, occasionally on the ground when the sun shines on a very thick dew. The falls of Niagara, and falls of less note—even small cascades and fountains, whose waters in falling are divided into drops, display rainbows when the spectator is in a proper position to observe them. But the most remarkable consequence of the refraction and reflection of light, is the numerous atmospherical deceptions which are thereby occasioned. Places at considerable distance are sometimes unexpectedly brought within the sphere of vision. Thus, in the year 1783, the coast of France was distinctly seen at Hastings, an account of which has been recorded in the Transactions of the Royal Society of London. Towns, hills, valleys, islands, ships, have been seen reflected in the heavens. In the county of Huntingdon, on the morning of July 16, 1820, at half-past four o'clock, the sun was shining in a cloudless sky, and the light vapours that arose from the river Ouse were moving over a little hill near St. Neots, when suddenly the village of Great Paxton, its farm-houses, barns, dispersed cottages, trees, and its different grass fields, were clearly and distinctly visible in a beautiful aerial picture, which extended from east to west about four hundred yards. Nothing could exceed the surprise and admiration of the spectator as he looked at this surprising phenomenon, nor his regret at its disappearance in about ten minutes. Among the Harz mountains in Hanover, at Souta Fell in Cumberland, in the south of Italy, and in many other places, analogous appearances have been observed. In the year 1827 the Skerry Islands, situated in the sea about four miles distant from the north coast of Ireland, appeared at an extraordinary elevation, apparently 200 yards above the level of the sea, breaking off by degrees in the centre, into appearances resembling old castles, towers, and spires; an account of which appears in the memoirs of the Wernerian Society of this city. Two or three of such images in an inverted position are sometimes seen one above the other. In this neighbourhood, Inchkeith has been seen reflected in the sky in an inverted position above the island, and above that another picture of it in its proper position. In the arctic seas, owing to the peculiar refraction

tive state of the atmosphere, such appearances are of frequent occurrence. When the rays of light fall on the surface of ice, they are thence reflected into the air above, and often afford an aerial map of the ice and sea below. This is termed the iceblink. Nothing can exceed the curious, and, at the same time, splendid exhibitions, presented by the unequal refraction of light from the ice and land in these regions. Hummocks of ice, says Captain Scoresby, assumed the forms of castles, obelisks, and spires; in some places the distant ice was so extremely irregular, and appeared so full of pinnacles, that it resembled a forest of naked trees; in others it presented the character of an extensive city, crowded with churches, castles, and public edifices. This intrepid navigator also records numerous instances of ships being seen reflected one above another in the sky, at a time when the ships themselves and the images were so distant as to be recognized only by the aid of a telescope. We have already explained how the rays of light become refracted in passing from a rarer into a denser medium, and the frequency of these appearances in these regions is owing to the varying and unequal density of the atmosphere, which, when moist and warm, becomes chilled and condensed by passing over the extensive surfaces of ice.

Light produces the most important and beneficial effect on the inanimate and animate creation, and, without its benignant agency, all nature would sicken and die. Many substances—oils, mineral acids, preparations of mercury, silver, lead, &c. change their colour when exposed to light. Those parts of the walls of a room which are painted with white lead and oil, and which are defended from light by furniture, become darker than the rest, but, on exposure, acquire the same brightness. Plants raised in the open air, when put into darkness, become pale, and fade in two or three days; those which, after being raised in darkness, have been exposed for a time to sunlight, cannot support the privation of light, but die. Plants that grow beneath stones are white, soft, watery, and insipid, of which fact gardeners avail themselves to furnish our tables with white and tender vegetables, by binding up and compressing their leaves together, so as to defend them from the contact of light. The light of a lamp can, although imperfectly, replace that of the sun. The plant becomes green, and inclines to the light; but this artificial light has a more beneficial influence if reflected from mirrors, and hence many hill-sides are rendered peculiarly fertile by the similar reverberation of the light. When the sky has been long obscured by clouds, the grass and leaves of trees lose their usual bright green colour. "Clouds and rain," says a Professor, writing from America, "have obscured the hemisphere during the last six days. In that time, the leaves of all the forests which are seen from this place have greatly expanded; but they were all of a pallid hue until this afternoon, when, within the period of about six hours, during which we had sunshine, they all changed their colour to a beautiful green."

The perfect absence of light is so injurious to plants that it has been concluded, that without the light of the moon and stars, night would destroy vegetables. The complexion of man, and the colours of the different races of animals, are considerably modified by exposure to light. African ladies that live much in the house are not so dark as those persons who live much in the open air; the palms of the hands and soles of the feet are lighter than parts of the body more exposed. Animals in the polar regions do not exhibit the variety of colours which those present that are natives of tropical climates. In this country, too, we observe that foxes, rabbits, hares, &c. assimilate to the colour of the soil they frequent. Birds, too, that fly by night do not display so varied and gaudy a plumage as those which fly by day. Animals, if totally deprived of light, would, like plants, languish and die. Nothing, indeed, can be more appalling than total darkness; and for this reason the threat of the Omnipotent is so terrible, which declares that the wicked shall be cast into outer darkness, where there shall be weeping and gnashing of teeth.

THE RAPIDS.—A TALE.

MIDNIGHT on board a steam-boat, a full moon, and a soft panorama of the shores of the St. Lawrence gliding by like a vision! I thus assume the dramatic prerogative of introducing my readers at once to the scene of my story, and with the same time-saving privilege, I introduce my *dramatis personæ*, a gentleman and lady promenading the deck with the slow step so natural on a summer's night, when your company is agreeable.

The lady leaned familiarly on the arm of her companion as they walked to and fro, sometimes looking at the moon, and sometimes at her pretty feet, as they stole out, one after the other, into the moonlight. She was a tall, queenly person, somewhat *embonpoint*, but extremely graceful. Her eye was of a dark blue, shaded with lashes of remarkable length, and her features, though irregular, were expressive of great vivacity, and more than ordinary talent. She wore her hair, which was of a deep chestnut, in the Madonna style, simply parted, and her dress, throughout, had the chaste elegance of good taste—the *tornure* of fashion without its extravagance.

Her companion was a tall, well formed young man, very handsome, with a frank and prepossessing expression of countenance, and the fine freedom of step and air which characterize the well bred gentleman. He was dressed fashionably, but plainly, and wore whiskers, in compliance with the prevailing mania. His tone was one of rare depth and melody; and as he bent slightly and gracefully to the lady's ear, his low, rich tenderness had the irresistible fascination, for which the human voice is sometimes so remarkable.

It was a beautiful night. The light lay sleeping

on the St. Lawrence like a white mist. The boat, on whose deck our acquaintances were promenading, was threading the serpentine channel of the "Thousand Isles," more like winding through a wilderness than following the passage of a great river. The many thousand islands clustered in this part of the St. Lawrence seem to realise the mad girl's dream when she visited the stars, and found them

"—only green islands, sown thick in the sky."

Nothing can be more like fairy land than sailing among them on a summer's evening. They vary in size, from a quarter of a mile in circumference, to a spot just large enough for one solitary tree, and are at different distances, from a bowshot to a gallant leap from each other. The universal formation is a rock of horizontal stratum, and the river, though spread into a lake by innumerable divisions, is almost embowered by the luxuriant vegetation which covers them. There is everywhere sufficient depth for the boat to run directly alongside, and with the rapidity and quietness of her motion, and near the neighbourhood of the trees, which may almost be touched, the illusion of aerial carriage over land, is, at first, almost perfect. The passage through the more intricate parts of the channel, is, if possible, still more beautiful. You shoot into narrow passes where you could spring on shore on either side, catching, as you advance, hasty views to the right and left, through long vistas of islands; or running round a projecting point of rock or woodland, open into an apparent lake, and darting rapidly across, seem running right on shore as you enter a narrow strait in pursuit of the covert channel.

It is the finest ground in the world for the "magic of moonlight." The water is clear, and, on the night we speak of, was a perfect mirror. Every star was repeated. The foliage of the islands was softened into distinctness, and they lay in the water, with their well-defined shadows hanging darkly beneath them, as distinctly as clouds in the sky, and apparently as moveable. In more terrestrial company than the lady Viola's, our hero might have fancied himself in the regions of upper air; but as he leant over the taffel, and listened to the sweetest voice that ever melted into moonlight, and watched the shadows of the dipping trees as the approach of the boat broke them one by one, he would have thought twice before he had said that he was sailing on a fresh water river, in the good steam-boat Queenston.

Miss Viola Clay and Mr. Frank Gresham, the hero and heroine of this true story, I should have told you before, were cousins. They had met lately after a separation of many years, and as the lady had in the meantime become the proudest woman in the world, and the gentleman had been abroad and wore whiskers, and had, besides, a cousin's *carte blanche* for his visits, there was reason to believe they would become very well acquainted.

Frank had been at home but a few months when he was invited to join the party with which he was now making the fashionable tour. He had seen Viola every day since his return, and had more to say to her than to all the rest of his relatives together. He would sit for hours with her in the deep recesses of the windows, telling his adventures when abroad. At least, it was so presumed, as he talked all the time, and she was profoundly attentive. It was thought, too, he must have seen some affecting sights, for now and then his descriptions made her sigh audibly, and once the colour was observed to mount to her very temples—doubtless from strong sympathy with some touching distress.

Frank joined the party for the tour, and had, at the time we speak of, been several weeks in their company. They had spent nearly a month among the Lakes, and were now descending by their grand outlet to Montreal. Many a long walk had been taken, and many a romantic scene had been gazed upon during their absence, and the lady had, many a time, wandered away with her cousin, doubtless for the want of a more agreeable companion. She was indefatigable in seeing the celebrated places from every point, and made excursions, which the gouty feet of her father, or the etiquette of a stranger's attendance, would have forbidden. In these cases Frank's company was evidently a convenience; and over hill and dale, through glen and cavern, he had borne her delicate arm by the precious privilege of cousinship.

There's nothing like a cousin. It is the sweetest relation in human nature. There is no excitement in loving your sister, and courting a lady in the face of a strange family requires the nerve of a martyr; but your dear familiar cousin, with her provoking maidenly reserve, and her bewitching freedoms, and the romping frolics, and the stolen tenderness over the skein of silk that will get tangled—and then the long rides which nobody talks about, and the long *tête-à-têtes* which are nobody's business, and the long letters of which nobody pays the postage—no, there is nothing like a cousin—a young, gay, beautiful witch of a cousin!

Till within a few days Frank had enjoyed a monopoly of the lady Viola's condescensions; but their party had been increased lately by a young gentleman who introduced himself to papa as the son of an old friend, and proceeded immediately to a degree of especial attention which relieved our hero exceedingly of his duties.

Mr. Erastus Van Pelt was a tall, thin person, with

an aquiline nose, and a forehead that retreated till it was lost in the distance. It was evident at the first glance that he was high *ton*. The authenticity of his style, even on board a steam-boat, distanced imitation immeasurably. The angle of his bow had been an insoluble problem from his *debut* at the dancing-school till the present moment, and his quizzing glass was thrown up to his eye with a grace that would have put Brummel to the blush. From the square toe of his pump to the loop of his gold chain he was a perfect wonder. Every body smiled on Mr Erastus Van Pelt.

This accomplished gentleman looked with an evil eye on our hero. He had the magnanimity not to cut him outright, as he was the lady's cousin; but tolerated him on the first day with a cold civility, which he intended should amount to a cut on the second. Frank thought him thus far very amusing; but when he came frequently in the way of his attentions to his cousin, and once or twice raised his glass at his remarks, with the uncomprehending 'Sir!' he was observed to stroke his black whiskers with a very ominous impatience. Further acquaintance by no means mended the matter, and Frank's brow grew more and more cloudy. He had already alarmed Mr Van Pelt with a glance of his eye that could not be mistaken, and anticipated his 'cut direct' by at least some hours, when the lady Viola took him aside, and bound over his thumb and finger to keep the peace towards the invisible waist of his adversary.

A morning or two after this precaution, the boat was bending in toward a small village which terminates the safe navigation above the rapids of the Split Rock. Coaches were waiting on shore, to convey passengers to the next still water, and the mixed population of the little village, attracted by the arrival, was gathered in a picturesque group on the landing. There was the Italian-looking Canadian with his clear olive complexion and open neck, his hat slouched carelessly, and the indispensable red sash hanging from his waist; and the still, statue-like Indian with the incongruous blanket and belt, hat and moccasin costume of the border, and the tall, inquisitive-looking Vermontese—all mingled together like the figures of a painter's study.

Miss Clay sat on the deck, surrounded by her party. Frank, at a little distance, stood looking into the water with the grave intentness of a statue, and Mr Van Pelt levelled his glass at the 'horrid creatures' on shore, and expressed his elegant abhorrence of their *sawagerie* in a fine spun *falsetto*. As its last thin tone melted, he turned and spoke to the lady with an air evidently more familiar than her dignity for the few first days seemed to have warranted. There was an expression of ill-concealed triumph in his look, and an uncompromised turning of his back on our *pense-ros*, which indicated an advance in relative importance; and though Miss Clay went on with the destruction of her card of distances just as if there was nobody in the world but herself, the conversation was well sustained till the last musical superlative was curtailed by the whiz of the escape valve.

As the boat touched the pier, Frank awoke from his reverie, and announced his intention of taking a boat down the rapids. Viola objected to it at first as a dangerous experiment; but when assured by him that it was perfectly safe, and that the boat, during the whole passage, would be visible from the coach, she opposed it no further. Frank then turned to Mr Van Pelt, and, to her astonishment, politely requested his company. The dandy was thunderstruck. To his comprehension it was like offering him a private interview with a bear. "No, Sir," said he, with a nervous twirl of his glass round his forefinger. Miss Clay, however, insisted on his acceptance of the invitation. The prospect of his company without the restraint of Frank's presence, and a wish to foster the good feeling from which she thought the offer proceeded, were sufficient reasons for perseverance, and on the ground that his beautiful cap was indispensable to the picturesque effect, she would take no denial. Most reluctantly his consent was at last given, and Frank sprang on shore with an accommodating readiness to find boatmen for the enterprise.

He found his errand was a difficult one. The water was uncommonly low, and at such times the rapids are seldom passed, even by the most daring. The old voyageurs received his proposition with shrugs and volumes of *patois*, in which he could only distinguish adjectives of terror. By promises of extravagant remuneration, however, he prevailed on four athletic Canadians to row him to Coteau du Lac. He then took them aside, and by dint of gesture and bad French, made them comprehend that he wished to throw his companion into the river. They had no shadow of objection. For a 'consideration' they would upset the bateau in a convenient place below the rapids, and insure Mr Van Pelt's subsequent existence at the forfeiture of the reward. A simultaneous '*Gardez vous!*' was to be the signal for action.

The coaches had already started when Frank again stood on the pier, and were pursuing slowly the beautiful road on the bank of the river. He almost repented his rash determination for a moment, but the succeeding thought was one of pride, and he sprang lightly into the bateau at the '*Allons!*' of the impatient boatmen.

Mr Van Pelt was already seated, and as they darted rapidly away with the first stroke of the oars, the

voyageur at the helm commenced a low recitative. At every alternate line, the others joined in a loud, but not inharmonious chorus, and the strokes were light or deep as the leader indicated, by his tone, the necessity of rapidity or deliberation. In a few minutes they reached the tide, and as the boat swept violently on, the oars were shipped, and the boatmen, crossing themselves and mumbling a prayer to the saint, sat still, and looked anxiously forward. It was evidently much worse than Mr Van Pelt had anticipated. Frank remarked upon the natural beauties of the river, but he had no eye for scenery. He sat on a low seat, grasping the sides of the boat with a tenacity as unphilosophical as it was out of character for his delicate fingers. The bateau glided like a bird round the island which divides the river, and, steering for the middle of the stream, was in a moment hurrying with its whole velocity onward. The Split Rock was as yet far below, but the intermediate distance was a succession of rapids, and, though not much dreaded by those accustomed to the navigation, they were to a stranger sufficiently appalling. The river was tossed like a stormy sea, and the large waves, thrown up from the sunken rocks, came rolling back upon the tide, and, dashing over the boat, flung her off like a tiny shell. Mr Van Pelt was in a profuse perspiration. His knees drawn up to his head by the acute angle of his posture, knocked violently together, and no persuasion could induce him to sit in the depressed stern for the accommodation of the voyageurs. He sat right in the centre of the bateau, and kept his eye on the waves with a manifest distrust of Providence, and an anxiety that betrayed a culpable want of resignation.

The bateau passed the travellers on shore as he neared the rock. Frank waved his handkerchief triumphantly. The water just ahead roared and leaped up in white masses like a thousand monsters; and, at the first violent whirl, he was pulled down by a voyageur, and commanded imperatively to lie still. Another and another shock followed in quick succession, and she was perfectly unmanageable. The helmsman threw himself flat on the bottom. Mr Van Pelt hid his face in his hands, and crouched beside him. The water dashed in, and the bateau, obeying every impulse, whirled and flung from side to side like a feather. It seemed as if every plunge must be the last. One moment she shivered and stood motionless, struck back by a violent blow, and the next, shot down into an abyss, with an arrowy velocity that seemed like instant destruction. Frank shook off the grasp of the voyageur, and, holding on to the side, half rose to his feet. "*Gardez vous!*" exclaimed the voyageur; and, mistaking the caution for the signal, with a sudden effort he seized Mr Van Pelt, and, plunging him over the side, leaped in after him. "*Diable!*" muttered the helmsman, as the dandy, with a piercing shriek, sprang half out of water and disappeared instantly. But the Split Rock was right beneath the bow, and like a shot arrow the boat sprang through the gorge, and in a moment was gliding among the masses of foam in the smooth water.

They put back immediately, and at a stroke or two against the current, up came the scientific 'brutus' of Mr Van Pelt, quite out of curl, and crested with the foam through which he had emerged to a thinner element. There was no mistaking its identity, and it was rudely seized by the voyageur with a tolerable certainty that the ordinary sequel would follow. All reasoning upon anomalies, however, is uncertain, and, to the terror of the unlettered captor, down went *un gentilhomme*, leaving the envy of the world in his possession. He soon reappeared, and with his faith in the unity of Monsieur considerably shaken, the voyageur lifted him carefully into the bateau.

My dear reader! were you ever sick? Did you have a sweet cousin, or a young aunt, or any pretty friend who was not your sister or your mother for a nurse? And do you remember how like an angel's fingers, her small white hand laid on your forehead, and how thrillingly her soft voice spoke low in your ear, and how inquiringly her fair face hung over your pillow? If you have not, and remember no such passages, it were worth half your sound constitution, and half your uninteresting health, and long life, to have had that experience. Talk of moonlight in a bower, and poetry in a *boudoir*—there is no atmosphere for love like a sick chamber, and no poetry like the persuasion to your gruel, or the sympathy for aching head, or your feverish forehead.

Three months after Frank Gresham was taken out of the St Lawrence, he was sitting in a deep recess with the lady, who, to the astonishment of the whole world, had accepted him as her lover. "Miss Viola Clay," said our hero, with a look of profound resignation, "when will it please you to attend to certain responses you wot of?" The answer was in a low sweet tone, inaudible to all save the ear for which it was intended.

CAPRICES OF THE HUMAN APPETITE.

THE human being has been described as an animal capable of suiting himself to every description of climate, ranging from the pole to the equator, and of adapting his habits either to those of savage life, or the highest state of refinement. His power of enduring a temperature which would freeze the blood of an alligator, or melt the body of a bear, is not more remarkable than the variety of food which he can digest, and the perfect power which he possesses of suiting his appetite to the different products of the animal and vegetable kingdoms. In

the selection of food, he is more governed by caprice and fashion, than the excellence of the repast; and the perversity of taste in this respect is really astonishing. We are informed by Tacitus that there was a man at Colonia Agrippina, whose favourite dish was spiders; and various tribes in the ancient world are noticed as having lived on a species of soup made of snakes and scorpions. Some barbarous nations in modern times feed on locusts, fresh or pickled, while the inhabitants of Madagascar are said to prefer them to the finest fish. But what must we say of the Cochinchinese, who esteem rotten eggs as one of the greatest delicacies, and so far do they carry this desire, that putrid eggs are rated thirty per cent. higher than fresh ones. This taste, however, need not excite so much surprise, when we recollect that the upper classes in this country prefer putrid to fresh game, and would not taste it till it acquired the fashionable *gout*. It is a standing joke against the French that they dress and eat frogs, and yet I have seen Frenchmen who were partial to these reptiles sicken when they saw rook or crow pies eaten in Scotland.

A story is told of a British sailor who could swallow and digest clasp or pen-knives, sometimes pouring half-a-dozen into his stomach at a time; and by which freak he ultimately killed himself. Perhaps it will be considered nearly as strange, when I mention that the Chinese gentry are passionately fond of *birds' nests*—the real nests of birds of the swallow species. This fancy for birds' nests obtains all over China, but can be followed up only by the very wealthiest classes. Such is the extraordinary demand for this description of food, that its cost is enormous; and to say in China that a man eats birds' nests, is equivalent to saying that he is a grandee or a person of great opulence. The nests, which are thus in such repute are not formed of clay, like those of our swallows, but are made of a substance resembling isinglass in appearance, which is understood by some to be gathered by the animal from certain marine matter. Mr Crawford, in his valuable work on the Eastern Archipelago, presents us with some interesting details relative to these nests worthy of notice.

"The birds' nests (says he) are those obtained in deep damp caves, and such as are taken before the birds have laid their eggs. The coarsest are those obtained after the young have been fledged. The finest nests are the whitest, that is, those taken before the nest has been rendered impure by the food and *feces* of the young birds. They are taken twice a-year, and, if regularly collected, and no unusual injury be offered to the caverns, will produce, very equally, the same quantity, being very little, if at all, improved by the caves being left altogether unmolested for a year or two. Some of the caverns are extremely difficult of access, and the nests can only be collected by persons accustomed from their youth to the office. In one place the caves are only to be approached by a perpendicular descent of many hundred feet, by ladders of bamboo and rattan, over a sea rolling violently against the rocks. When the mouth of the cavern is attained, the perilous office of taking the nests must often be performed with torch light, by penetrating into the recesses of the rock, where the slightest trip would be instantly fatal to the adventurers, who see nothing below them but the turbulent surf making its way into the chasms of the rock.

The only preparation the birds' nests undergo is that of simple drying, without direct exposure to the sun, after which they are packed in small boxes. They are assorted for the Chinese market into three kinds, according to their qualities. The common prices for birds' nests at Canton are, for the first sort, no less than 3,500 Spanish dollars the picul, or L.b. 18s. 1½d. per pound; for the second, 2800 Spanish dollars per picul; and for the third, 1600 Spanish dollars. From these prices it is sufficiently evident that the birds' nests are no more than an article of expensive luxury. They are consumed only by the great; and, indeed, the best part is sent to the capital for the consumption of the court. The sensual Chinese use them under the imagination that they are powerfully stimulating and tonic; but it is probable that their most valuable quality is their being perfectly harmless. The people of Japan, who so much resemble the Chinese in many of their habits, have no taste for the edible nests; and how the latter acquired a taste for this foreign commodity, is no less singular than their persevering in it. Among the western nations there is nothing parallel to it, unless we except the whimsical estimation in which the Romans held some articles of luxury, remarkable for their scarcity rather than for any qualities ascribed to them. The whole quantity of birds' nests exported from the Indian Archipelago is estimated at 242,400 lbs., worth L.284,290. The value of this immense property to the country which produces it, rests upon the capricious wants of a single people. It is claimed as the exclusive property of the sovereign, and everywhere forms a valuable branch of his income, or of the revenue of the state."

EMIGRATION.—PRINCE EDWARD ISLAND.

WHILE the flood of British emigration has been poured chiefly into Upper Canada, whose unoccupied lands offer a boundless scope for the efforts of human labour, the American colonial possessions lying nearer home, situated in and about the mouth of the St Lawrence, have received a very considerable body of settlers, many of whom have proceeded from the Highlands of Scotland. The three principal places of settlement in this quarter are New Brunswick, Prince Edward Island, and Nova Scotia. The first of these being already noticed in the Journal, I proceed to offer an account of the second, drawn from the valuable work of Macgregor on British America.

"Prince Edward Island is situated in the Gulf of St Lawrence, within the latitudes of 46° and 47° 10' north. Its length is 140 miles, and its greatest breadth 34. It is separated from Nova Scotia by Northumberland Strait, which is only nine miles abroad. Cape Breton lies within twenty-seven miles of the east point. In coming

* From "The Legendary, consisting of Original Pieces, principally illustrative of American History, Scenery, and Manners. Edited by N. P. Willis. Boston, 1828."

within view of Prince Edward Island, its aspect is that of a level country, covered to the water's edge with trees, and the outline of its surface scarcely curved with the appearance of hills. On approaching nearer, and sailing round its shores (especially on the north side), the prospect becomes interesting, and presents small villages, cleared farms, red head-lands, bogs, and rivers, which pierce the country; sand-hills covered with grass; a gentle diversity of hill and dale, which the cleared spots open to view, and the undulation of surface occasioned by small lakes or ponds, which from the sea appear like so many valleys.

On landing, and travelling through the country, its varied, though not highly romantic scenery, and its agricultural and other improvements, attract the attention of all who possess a taste for rural beauties. Owing to the manner in which it is intersected by various branches of the sea, there is no part at a greater distance from the ebbing and flowing of the tide than eight miles. It abounds with streams and springs of the purest water. There are no mountains in the island; a chain of hills intersects the country; and in different parts the lands rise to moderate heights, but in general the surface of the island may be considered as deviating no more than could be wished for the purpose of agriculture. Almost every part affords agreeable prospects and beautiful situations. In summer and autumn, the forests exhibit a rich and splendid foliage, varying from the deep green of the fir, to the lively tints of the birch and maple, and the character of the scenery at these seasons displays a smiling loveliness and teeming fertility. The island is divided into three counties, these again into parishes, and the whole subdivided into sixty-seven townships, containing about 20,000 acres each. The plot of a town, containing about 400 building lots, is reserved in each county. Charlotte Town, the seat of government, is situated on the north bank of Hillsborough river (east side of the island), and its harbour is considered one of the best in the Gulf of St. Lawrence. The town stands on ground which rises in gentle heights from the banks of the river, and contains about 350 dwelling-houses, and about 3400 inhabitants.

The climate of Prince Edward Island, owing to its lying within the Gulf of St. Lawrence, partakes, in some measure, of the climate of the neighbouring countries; but the difference is greater than any one who has not lived in the colony would imagine. In Lower Canada the winter is nearly two months longer, the frosts more severe, and the snows deeper, while the temperature during summer is equally hot. In Nova Scotia, New Brunswick, and Cape Breton, the frosts are equally severe, the transitions from one extreme of temperature to another more sudden, and fogs frequent along those parts that border on the Atlantic and Bay of Fundy. The atmosphere of this island is noted for being free of fogs. A day foggy throughout seldom occurs during a year, and in general not more than four or five that are partially so. As regards the salubrity of the island, it is agreed by all who have lived any time on it, and have compared its climate with that of other countries, that there are few places where health is enjoyed with less interruption. The fevers and other diseases of the United States are unknown here; no person ever saw an intermittent fever produced on the island, nor will that complaint, when brought here, ever stand above a few days against the influence of the climate. Pulmonary consumption, which is so common and so very destructive in the northern and central states of America, is not often met with here. Probably ten cases of this complaint have not occurred since the settlement of the colony. Colds and rheumatisms are the most common complaints; the first generally affects the head more than the breast, and the last seldom proves mortal. A very large proportion of the people live to old age, and then die of no acute disease, but by the gradual decay of nature. Deaths between twenty and fifty years of age are but few when compared with those of most other countries. The diseases at present commonly known are usually the consequence of colds or intemperance, if we except consumptions, which I have observed in most cases to be constitutional; and the young women born on the island appear to be more subject to this malady than those who remove to the colony from Europe. The climate is decidedly salubrious. Bilious complaints are unknown; and I have conversed with several people who were affected with ill health previous to their settling in this colony, who afterwards enjoyed all the comforts of an unimpaired constitution. The absence of damp weather and noxious exhalations, those certain generators of disease, and the island having no lakes, and few ponds of fresh water, while it is at the same time surrounded by the sea, will account satisfactorily for the excellence of its climate.

The general structure of the soil is, first, a thin layer of black or brown mould, composed of decayed vegetable substances; then to the depth of a foot, or more, a light loam prevails, inclining in some places to a sandy, in others to a clayey character; below which, a stiff clay, resting on sand-stone, predominates. The prevailing colour of both soil and stone is red. To this general character of the soil there are but few exceptions; these are the bogs, or swamps, which consists either of a soft spongy turf, or deep layer of wet black mould, resting on white clay or sand. In its natural state, the quality of the soil may be readily ascertained by the description of wood growing on it, it being richest where the maple, beech, black birch, and a mixture of other trees, grow, and less fertile where the pine, spruce, larch, and other varieties of the fir tribe, are most numerous. The soil is fertile; and there is scarcely a stone on the surface of the island that will impede the progress of the plough. There is no limestone nor gypsum, nor has coal yet been discovered although indications of its existence are produced. Red clay, of superior quality for bricks, abounds in all parts of the island. Both the swamps and barrens bear but a small proportion to the whole surface of the island; and as they all may, with judicious management, be improved advantageously, it cannot be

said that there is an acre of the whole incapable of cultivation. The marshes, which are overflowed by the tide, rear a strong nutritious grass, and when dyked, yield heavy crops of wheat or hay.

Large tracts of the original pine forests have been destroyed by fires, which have raged over the island at different periods. In these places white birches, spruce-firs, poplars, and wild cherry trees, have sprung up. Poplars of great dimensions are plentiful. Many other trees are met with. Among the wild fruits, raspberries, strawberries, cranberries (which are very large), blueberries, and wortleberries, are astonishingly abundant. Foxes and hares are numerous. Mosquitoes and sand-flies are only annoying during the heat of summer in the neighbourhood of the marshes, and in the woods; where the lands are cleared to any extent, they are seldom troublesome. The varieties of fish that swarm in the harbours and rivers, or around the shores, and that abound on the different fishing banks in the vicinity of the island, are numerous, each abounding in great plenty.

The excellence of its soil, its climate, and the configuration of the surface, adapt the lands of Prince Edward Island more particularly for agriculture than for any other purpose. All kinds of grain and vegetables raised in England ripen in perfection. Wheat is raised in abundance for the consumption of the inhabitants, and a surplus is exported to Nova Scotia. Both summer and winter rye, and buckwheat, produce weighty crops; but the culture of these grains is scarcely attended to. Barley and oats thrive well, and are, in weight and quality, equal to any met with in the English markets, and superior to what are produced in the United States. Beans of all kinds yield plentiful returns. Peas, when not injured by worms, which is often the case, thrive well; and turnips are sometimes liable to flies and worms. In no country do parsnips, carrots, beets, mangel-wurzel, or potatoes, yield more beautiful crops. Cucumbers, salads, cabbages, cauliflowers, asparagus, and, indeed, all culinary vegetables common in England, arrive at perfection. Cherries, plums, damsons, black, red, and white currants, ripen perfectly, and are large and delicious. Flax is raised of excellent quality, and manufactured by the farmers' wives into linen for domestic use. Hemp will grow, but not to the same perfection as in Upper Canada, or some parts of Nova Scotia and New Brunswick. The principal grasses are timothy, red and white clover, and a kind of soft indigenous upland grass of which sheep are very fond; also marsh grasses on which young and dry cattle are fed during the winter months. As a few cold days and wet weather frequently occur in the latter end of April, or the first week of May, wheat or oats are seldom sown until the first of the latter month. Barley will ripen if sown before the 20th of June, although it is generally more early. Potatoes are planted about the last of May, or before the middle of June, and often later. Turnip seed is sown about the middle of July; some prefer sowing it in the first week in August, in which case the leaves are not so liable to injury from worms. Gardening commences early in May, and generally combines the different departments of fruits, flowers, and vegetables. Hay-making begins in the latter end of July, and as the weather is commonly very dry at this time, it is attended with little trouble in curing. Potatoes and turnips are left undug until the middle or end of October; the first are generally ploughed up, except on new land, where the hoe alone is used. Parsnips may remain on the ground during winter, and are finer when dug up in spring than at any other period.

Milch cows, and such horses and cattle as require most care, are housed in November, but December is the usual month for housing cattle regularly. Sheep thrive better by being left out all winter; but they require to be fed, and it is necessary to have a shelter without a roof, to guard against the cold winds and snow drift. Black cattle are generally smaller than in England; a good ox will weigh from eight to nine hundred pounds, but the common run will not exceed six or seven hundred. The beef is usually very fine and tender. Sheep thrive remarkably well; but until lately very little care was observed in improving the breed. Swine seem to thrive here as well as in any country, and the pork brought to Charlotte Town by the farmers is probably equal in general to that met with in the Irish market. Little care is, however, taken of swine. The horses are, with few exceptions, small, but capable of performing long journeys, and enduring great fatigue with much spirit. The greater number of farmers, particularly the Highland Scotch, keep by far too many cattle for the quantity of provender they usually have to feed them with during winter. These people think if they can manage to carry their cattle through the winter, they are doing well; but the consequence is, that their cattle, especially milch cows, are in such lean condition in spring, that they are not in tolerable order till July. Various improvements are taking place by means of cattle shows, and exhibitions of agricultural produce, which have been established. It is also pleasing to observe the improvement in the mode of cultivating the land, which has spread over the colony during the last few years, and which may be attributed principally to the force of example set by a few of the old settlers, chiefly the loyalists and lowland Scotch, and by an acquisition of industrious and frugal settlers from Yorkshire in England, and from Dumfriesshire and Perthshire in Scotland.

The principal disadvantage connected with this island, and in fact the only one of importance, is the length of the winters, which renders it necessary to have a large store of hay for supporting live stock; and which also, from the abrupt opening of spring and summer, abridges the season for sowing and planting. These disadvantages are, however, felt with equal severity in Prussia, and over a great part of Germany, where the people employed in agricultural pursuits form the majority of the inhabitants. About a ton of straw for each, taking large and small together, is requisite to winter black cattle properly. The winter season has also many advantages—wood and firing poles are easily brought from the forests, over the smooth slippery roads made by the frosts and snows, and distances are shortened by the bays and rivers being frozen over. The ground is also considered to be fertilized by deep snow and frosts, and there are few farmers who consider the winter an impediment to agriculture, otherwise than the spring opening so suddenly upon them, and the astonishing quickness of vegetation, leaving them only five or six weeks for preparing the soil, and sowing and planting. When we consider, however, that the autumn and fall are much finer, and of longer duration, than in Europe, and the winter setting in generally much later, the former have, in reality, little cause to complain of seasons, as they have abundant time to plough all the grounds in the fall, which is, at the same time, known to be the most proper season for American tillage. The common plan of laying out farms in this colony is in lots, containing a hundred acres each, having a front of ten chains, either on the sea shore, a bay, river, or wood, and running one hundred chains back. This plan, from the farms being in strips, instead of square blocks, is often objected to; but it has many advantages, by giving a greater number of settlers the benefits of roads, shores, and running streams."

Mr Macgregor proceeds to give us an account of the mode of settling on new lands, and a variety of interesting particulars regarding the inhabitants of Prince Edward Island, but these details must form the subject of another article.

CONSTANTINOPLE IN 1831.

FROM THE JOURNAL OF AN OFFICER.

THE changes effected both in the dress and manners of the inhabitants of Constantinople, and in the style of the city itself, since I last visited it in 1818, were to me most surprising and unexpected. Certainly the greatest portion of the imposing appearance of the Turks has been lost by the recent reform in their costume, which formerly was rich, elegant, and varied; but under this present Frank or European garb, they have become an ill-dressed, slovenly, nay, even in most cases, a ridiculously mean-looking race. The crimson stuffed cap, surmounted by a blue spread tassel, descends low on the eyebrows, and how deeply must its enemies sigh after the proud and fanciful turban! The younger and less respectable Turks who have adopted the new costume put on short round jackets with upright collars, buttoned to the chin, and, according to the season, wear very loose calico or woollen Cossack trousers. The older and more respectable classes make use of loose, long surtout coats, with stiff straight collars; waistcoats, loose trousers, and tie black shoes, complete the dress; and sometimes a dirty white neckcloth is tied uncomfortably about their throats. To conceal, however, this cruel abolition of a beautiful national dress, a military cloth cloak is worn by the Effendis, which conceals the horrors of their present habiliments. So altered are the gentry of the new costume, that I should say their next step would be to turn Christians. The European dress was never intended for a Mahomedan, or even an Asiatic.

It is astonishing the effect dress has on the habits of the human race. Thus the Turks became more dignified and slothful than by nature they were intended to have been, because they could neither manage on foot the arrangement of their heaps of clothes, nor walk with comfort in their slippers. Since the tails of their coats have been clipped, certainly they move about with more activity. The sword is much more rapid in the work of conversion than the tongue. The Sultan uses the former weapon without any remorse; and it must be confessed, after all, that the Turks are a dastardly people, easily intimidated, submissive, and cringing. This has become apparent since the destruction of the Janissaries. Military costume is the fashionable dress of the day, whilst all copying from the Sultan wear their beards of the same length as his, and pull their caps equally low over their foreheads. The national colour for the army is blue. I never saw a better-behaved body of men than the new troops, trained and regimented on the European principle; they are always ready to give assistance to foreigners when required.

The city of Constantinople is much improved by being kept very clean, by the erection of new bazaars, by the embellishment of the old ones, and by the guardianship of a very vigilant police. The streets are now free from all rubbish and offensive objects; no notice is taken of foreigners; and even European females, without the slightest change of costume, may walk through every part unmolested, and almost unobserved.

Last Friday we went to see the Sultan on his week-

ly visit to a mosque, to hear divine service. It was on the Pera side of the Bosphorus. About 5000 infantry, with a powerful band, were drawn out in one line from the entrance of the place of worship to receive him. They must have been part of a select corps, since the men were very well dressed, and remarkably good-looking, stout, and tall. They handled their arms well, and were steady. We were placed under the veranda of a coffee-house, close to which the Sultan passed. His Majesty was preceded by sixed horses, saddled and bridled in the European manner, with richly-embroidered shabracks; then came double files of mounted pages, dressed in various coloured jackets and white trousers, officers of the household, aides-de-camp, and other military attendants; and lastly, the favourite Meer Allace, or General of the Guards, Hoosain Pasha. To these succeeded the Sultan, immediately followed by a personal guard of infantry, composed of remarkably fine, handsome young men. He wore the scarlet military cap, embroidered round the sides, and surmounted by a rich gold tassel, the long bullion of which hung like a fringe over its crown. A cloak of sky-blue cloth, with straight embroidered collar, almost concealed his under-dress, a light cloth jacket, buttoned tight up to the chin, his gold-laced white kersermere trousers, and boots with spurs. On his left breast shone a most beautiful diamond star. His sabre and belt were European, as also his saddle and bridle. For a moment I could scarcely place faith in my sight, so changed was this haughty monarch "of the sea and earth," from what I had seen him some years back, moving in the full awfulness of Asiatic majesty. The waving plumes of the multitude of shatters, or running footmen, then screened him from the gaze of his subjects; he was borne on by his horse at a movement almost motionless, his eyes were fixed, countenance pale, gloomy, and most melancholy; and now I beheld the same powerful sovereign decked out in a flippant uniform, very similar to that of a light cavalry officer, with florid complexion, active, inquisitive gaze, and beard clipped almost to the chin. I must say, Sultan Mahmood seemed to enjoy his emancipation from all the thralldoms of pomp and ceremony. In about half an hour the Sultan returned, and every part of the procession was managed without the slightest noise or confusion. Though, I imagine, the Sultan must have moments of great uneasiness regarding his personal safety, he does not hesitate to move amongst the crowded streets, or apparently show occasions when attempts might be made on his life.

Persons who, by a long sojourn in Constantinople, have acquired a considerable and more than superficial knowledge of Turkish affairs, assert that the late changes and ameliorations, instead of retarding will accelerate the downfall of the Ottoman government. The spirit of the people has been broken, and both national and religious feelings humbled and outraged. It is an arduous undertaking for a monarch endowed even with great wisdom and resolution to reform a nation, particularly a nation professing the Mahomedan faith; yet I should say, that much has apparently been effected in Constantinople; and, judging superficially, we would deem it the capital of a prosperous and vigorous government. The public buildings are undergoing general repair, old edifices are removing to be erected anew, and everywhere there is a certain stir denoting activity. Yet these signs of improvements are only observable in Constantinople, whilst the provinces are oppressed, misruled, and absolutely defenceless. If the system pursued by the Sultan does not produce the results anticipated by many, even to the regeneration of his people, certainly the body of the nation has been relieved from the insolence and lawless habits of the Janissaries; and those predatory bands of horsemen, the Dehles and Hytees, no longer pillage and desolate the country. Criminals are now with facility seized and punished, and for years the Turkish empire has not been so tranquil, or so secure for foreigners, travellers, or merchants.—*United Service Journal.*

SCENERY AROUND JERUSALEM.

The most pleasing feature in the scenery around Jerusalem (continues Carne, in his Letters from the East,) is the valley of Jehoshaphat. Passing out of the gate of St Stephen, you descend the hill to the torrent of the Kedron; a bridge leads over its dry and deep bed; it must have been very narrow, though in winter a rapid stream. A few steps beyond the Kedron, you come to the garden of Gethsemane, of all gardens the most interesting and hallowed, but how neglected and decayed! It is surrounded by a kind of low hedge, but the soil is bare; no verdure grows on it, save five or six fine venerable olive trees, which have stood here for many centuries. This spot is at the foot of Olivet, and is beautifully situated; you look up and down the romantic valley; close behind rises the mountain; before you are the walls of the devoted city. While lingering here, at evening and solitary—for it is not often a footstep passes by—that night of sorrow and dismay rushes on the imagination, when the Redeemer was betrayed, and forsaken by all, even by the loved disciple. Hence the path winds up the Mount of Olives: it is a beautiful hill. On the summit are the remains of a church, built by the Empress Helena. Descending Olivet to the narrow valley of Jehoshaphat, you soon come to the pillar of Absalom: it has a very antique appearance, and it is a pleasing object in the valley; it is of a yellow stone, adorned

with half columns, formed into three stages, and terminates in a cupola. The tomb of Zecharias, adjoining, is square, with four or five pillars, and is cut out of the rock.

The small and wretched village of Siloa is built on the rugged sides of the hill above; and just here the valleys of Hinnom and Jehoshaphat meet, at the south east corner of Mount Zion; they are both sprinkled with olive trees. Over the ravine of Hinnom, and directly opposite the city, is the Mount of Judgment, or of Evil Counsel; because there, they say, the rulers took counsel against Christ, and there the palace of Caiaphas stood. It is a broad and barren hill, without any of the picturesque beauty of Olivet, though loftier. On its side is pointed out the Acladema, or field where Judas hung himself: a small and rude edifice stands on it, and it is used as a burying place. But the most interesting portion of this hill is where its rocks descend precipitously into the valley of Hinnom, and are mingled with many a straggling olive tree. All these rocks are hewn into sepulchres of various forms and sizes; no doubt they were the tombs of the ancient Jews, and are in general cut with considerable care and skill. The valley of Hinnom now turns to the west of the city, and extends rather beyond the north vale; here the plain of Jeremiah commences, and is the best wooded tract in the whole neighbourhood. Above half a mile from the wall is a ruined desolate building, adorned with a few trees, and said to be the tombs of the kings.

On a delightful evening, we rode to the wilderness of St John. The monastery of that name stands at the entrance; it is a good and spacious building, and its terrace enjoys a fine prospect, in which is the lofty hill of Modin, with the ruins of the palace of the Maccabees on its summit. A small village adjoins the convent, in which are shown the remains of the house of Elizabeth, where the meeting with Mary took place. The next morning we visited the wilderness; it is narrow, partially cultivated, and sprinkled with trees; the hills rise rather steep on each side; from that on the right, a small stream flows into the ravine below. The whole appearance of the place is romantic; and the prophet might have resided here, while exercising his ministry, with very little hardship. The neighbourhood still, no doubt, produces excellent honey, which is to be had throughout Palestine. High up the rocky side of the hill on the left, amidst a profusion of trees, is the cave or grotto of St John. A fountain gushes out close by. When we talk of wildernesses, mountains, and plains in Palestine, it is to be understood that they seldom answer to the size of the same objects in more extensive countries; that they sometimes present but a beautiful miniature of them. From the east end of the wilderness you enter the famous valley of Elah, where Goliath was slain by the champion of Israel. It is a pretty and interesting looking spot, the bottom covered with olive trees. Its present appearance answers exactly to the description given in Scripture; the two hills on which the armies stood entirely confining it to the right and left. The valley is not half a mile broad. Tradition was not required to identify this spot; nature has stamped it with everlasting features of truth. The brook still flows through it in a winding course, from which David took the smooth stones; the hills are not precipitous, but slope gradually down; the vale is varied with banks and undulations, and not a single habitation is visible in it. From the scenes of some of the battles and positions of armies in those times, it is difficult to account for the mighty numbers stated as having fought; where could they be drawn up? The rich and beautiful plain of Esdralon is the most spacious area in the country, and was the theatre of some battles; and the plain of Jericho is next in extent; but when we read that many hundreds of thousands of men fought around Mount Ephraim, and other scenes in this country, one is tempted to wonder how the confined valleys and open places one traverses could have contained them.

At the south-east of Zion, in the vale of Jehoshaphat, they say the gardens of Solomon stood, and also on the sides of the hill adjoining that of Olivet. It was not a bad, though rather a confined site for them. The valley here is covered with a rich verdure, divided by hedges into a number of small gardens. The places within the walls of the city, which tradition would render sacred, are innumerable. Beneath the gate of Bethlehem is shown the spot where Bethsheba was bathing when the King beheld her from the roof of his palace, and the present tower of David is built on the site of the ancient edifice. A small distance within the gate of St Stephen that fronts Olivet, is the pool of Bethesda; it is deep and dry, the sides and bottom overgrown with grass, and containing two or three trees. A wretched street leads from this to the governor's palace, a spacious and rather ruinous building of Roman architecture; it contains some good apartments, the windows of which command an excellent view of the Mosque of Omar and its large area. In the palace the monks point out the room where Christ was confined before his trial; and at a short distance is a dark and ruinous hall, shown as the judgment-hall of Pilate. A little farther on is the arch where the Redeemer stood, as his judge exclaimed, "Behold the man." You then proceed along the street where Christ bore his cross, in which, and in the street leading up to Calvary, are three places where, staggering under the weight, he fell. These are marked by three small pillars laid flat on the ground. Departing from Jerusalem, and after many dangers, we came in sight of the Dead Sea, whose waters cover the cities of Sodom and Gomorrah. On reaching the brink of the precipices which hang over the Dead Sea, the dawn was just appearing; and in the grey and cold light, the lake was seen far beneath, stretched out to an interminable length, while the high mountains of Arabia Petraea opposite were shrouded in darkness. The descent of the heights was long and difficult, and ere we reached the bottom, the ruddy glare of morning was on the precipices over our heads. The line of shore at the bottom was about two hundred yards wide, and we hastened to the edge of the lake; but for several

yards from it, the foot sunk in a black mud, and its surface was everywhere covered with a grayish scurf, which we were obliged to remove before tasting it. There was not a breath of wind, and the waters lay like lead on the shore. Whoever has seen the Dead Sea, will ever after have its aspect impressed on his memory; it is, in truth, a gloomy and fearful spectacle. The precipices, in general, descend abruptly into the lake, and on account of their height, it is seldom agitated by the winds. Its shores are not visited by any footsteps, save those of the wild Arab, and he holds it in superstitious dread. On some of the rocks there is a thick sulphureous encrustation, which appears foreign to their substance; and in their steep descents there are several deep caverns, where the benighted Bedouin sometimes finds a home. No unpleasant effluvia are perceptible around it, and birds are occasionally seen flying across. For a considerable distance from the bank the water appeared very shallow; this, with the soft slime of the bottom, and the fatigue we had undergone, prevented our trying its buoyant properties by bathing. A few inches beneath the surface of the mud are found the black sulphureous stones out of which crosses are made and sold to the pilgrims. The water has an abominable taste, in which that of salt predominates; and we observed encrustations of salt on the surface of some of the rocks.

The mountains of the Judæan side are lower than those of the Arabian, and also of a lighter colour. Bitumen abounds most on the opposite shore. There is no outlet to the lake, though the Jordan flows into it, as did formerly the Kedron, and the Arnon to the south. It is not known that there has ever been any visible increase or decrease of its waters. Some have supposed that it finds a subterraneous passage to the Mediterranean, or that there is a considerable suction in the plain which forms its western boundary. But this plain, confined by the opposite mountains, is partially cultivated, and produces trees, and a rude pasture used by the camels of the Bedouins, although in some parts sandy. It has never been navigated since the cities were engulfed; and it is strange that no traveller should have thought of launching a boat to explore it, the only way that promises any success. Some stunted shrubs and patches of grass, a mere mockery of verdure, were scattered on the withered soil near the rocks. The golden and treacherous apples

That turn to ashes on the lips,

will be sought for in vain, as well as the fish in the lake, which have been also asserted to exist. The length of the Dead Sea is probably about sixty miles, and the general breadth eight. The sun had now risen above the eastern barrier of mountains, and shone full in the bosom of the lake, which had the appearance of a plain of burnished gold. But the sadness of the grave was on it, and around it, and the silence also. However vivid the feelings are on arriving on its shores, they subside after a time into languor and uneasiness, and you long, if it were possible, to see a tempest wake on its bosom, to give sound and life to the scene. The passage over the wilderness of Ziph had given us a more complete and intimate view of the lake than the usual route to Jericho, which conducts only to its commencement, at the embouchure of the Jordan. We had now to walk to its extremity along the shores, and over the plain to Jericho, in a sultry day; and we took a last look of this famous spot, to which earth can furnish no parallel. The precipices around Sinai are savage and shelterless, but not like these, which look as if the finger of an avenging God had passed over their blasted fronts and recesses, and the deep at their foot, and caused them to remain for ever as when they first covered the guilty cities.

EXTRAORDINARY ABSTINENCE FROM FOOD.

The more that animals enjoy the qualities of youth, strength, and activity, the greater is the increase and development of their parts, and the greater the necessity for an abundant supply of food. Of many individuals exposed to an absolute abstinence of many days, the young are always the first to perish. Of this the history of war and shipwreck offers in all ages too many frightful examples. There are several instances on record of an almost total abstinence from food for an extraordinary length of time. Captain Bligh, of the *Bounty*, sailed nearly 4000 miles in an open boat, with occasionally a single small bird, not many ounces in weight, for the daily sustenance of 17 people; and it is even alleged, that 14 men and women of the *Juno*, having suffered shipwreck on the coast of Arracan, lived 23 days without any food. Two people first died of want on the fifth day. In the opinion of Rhedi, animals support want much longer than is generally believed. A civet cat lived 10 days without food, an antelope 20, and a very large wild cat also 20; an eagle survived 28 days, a badger one month, and several dogs 36 days. In the memoirs of the Academy of Sciences there is an account of a bitch, which having been accidentally shut up alone in a country-house, existed for 40 days without any other nourishment than the stuff on the wool of a mattress which she had torn to pieces. A crocodile will live two months without food, a scorpion three, a bear six, a chameleon eight, and a viper ten. Vaillant had a spider that lived nearly a year without food, and was so far from being weakened by abstinence, that it immediately killed another large spider, equally vigorous, but not so hungry, which was put in along with it. John Hunter inclosed a toad between two stone flower-pots, and found it as lively as ever after 14 months. Land-tortoises have lived without food for 18 months; and Baker is known to have kept a beetle in a state of total abstinence for 3 years. It afterwards made its escape. Dr Shaw gives an account of two serpents which lived in a bottle without any food for five years.—*Encyc. Brit., new edit.*

Column for Young Women.

Of in the pleasant villages of France,
Some high-born lady crowns the rustic maid
With floral emblems of her modest worth.

It must never be forgotten by young women that mental improvement should be always conducive to moral advancement. Piety, integrity, fortitude, charity, obedience, consideration, sincerity, prudence, activity, and cheerfulness, may be presumed to define those moral properties called for in the daily and habitual deportment of young females, whether in higher or lower stations of life. The chief of these virtues is piety; but while the juvenile heart glows with devotion to the Creator, it must be taught that there are many earthly duties to be performed in the business of life, and prudence will point out that the exercise of these is not incompatible with genuine religious feeling. Piety forms a solid basis whereon to rear a superstructure of human affections and human action; and when properly indulged in, it will not interfere with the necessary and virtuous pursuits of the world. It is one of the greatest errors which a young woman can commit, when she imagines that she will fall under the anger of the Almighty by attending to the ordinary duties of life. This is the perversion of true religion, and there have been many melancholy examples of its mischievous character. I once heard of a young lady, the daughter of a gentleman in the country, who, from mistaken motives on this score, or allowing her mind to go into a diseased state, became affected with a religious madness, if it may be so called; she spent not only whole hours but whole days on her knees in the exercise of prayer; she gave up all attention to her domestic duties; would not enter into conversation or see any company, and almost broke the heart of a fond parent. No advice nor admonition could turn the current of her feelings; she gradually pined away in her health and personal appearance, and it was obvious that she was not long for this world. While in this dismal condition, it happened that a certain clergyman called upon her father, and remarked with pain the altered aspect of his daughter; on hearing the reason, he endeavoured to show to her the impropriety of her behaviour, and how ill it accorded with that dutiful devotion to God pointed out by the tenets of our faith. Yet all would not do; the lady was obstinate. Before leaving the house, the clergyman, who was a poet as well as a divine, and is well known in the South of Scotland for the exceeding beneficence of his character, and the kindness of his manners, conveyed to her the following lines applicable to her case:—

THE PIOUS ENTHUSIAST.

Why, lovely maid, thus waste thy blooming prime,
Of earth regardless and the things of Time?
Thou may'st become an inmate of the skies,
Without dissolving Nature's tender ties;
The gracious Power who rules o'er heaven and earth
Is not the foe of youthful, harmless mirth;
And though He bids thee think on things above,
Forbids thee not to own an earthly love;
All sentient creatures happy are and gay,
In the mild morning of life's little day,
And seldom scorn to bless the cheerful light,
Thro' apprehension of the coming night;
Though Christ demands an undivided heart,
Yet kindred beings justly claim a part:
Thus heavenly objects may thy thoughts employ,
In harmony with Friendship, Love, and Joy.

It is satisfactory to add, that these simple lines had the beneficial effect of awakening the lady to a sense of her folly; and their insertion here may possibly have a similar result in cases to which they bear a reference.

PERSONAL BEAUTY.

A recent writer concludes his observations on the means to be adopted to procure beauty in the person in these words:—"Let then the ladies observe the following rules:—In the morning use pure water as a preparatory ablution: after which they must abstain from all sudden gusts of passion, particularly envy, as that gives the skin a sallow paleness. It may seem trifling to talk of temperance, yet must this be attended to, both in eating and drinking, if they would avoid those pimples for which the advertised washes are a cure. Instead of rough, let them use moderate exercise, which will raise a natural bloom in their cheek, imitable by art. Ingenious candour, and unaffected good humour, will give an openness to their countenance that will make them universally agreeable. A desire of pleasing will add fire to their eyes, and breathing the morning air at sunrise will give their lips a vermilion hue. That amiable vivacity which they now possess may be happily heightened and preserved, if they avoid late hours and card-playing, as well as novel-reading by candle-light, but not otherwise; for the first gives the face a drowsy, disagreeable aspect, the second is the mother of wrinkles, and the third is a fruitful source of weak eyes and a sallow complexion. A white hand is a very desirable ornament; and a hand can never be white unless it be kept clean; nor is this all, for if a young lady would excel her companions in this respect, she must keep her hands in constant motion, which will occasion the blood to circulate freely, and have a wonderful effect. The motion recommended is working at her needle, brushing up the house, and twirling the distaff."

A LITERARY WIFE.

How delightful is it (says D'Israeli, in his *Curiosities of Literature*), when the mind of the female is so happily disposed, and so richly cultivated, as to participate in the literary avocations of her husband. It is then truly that the intercourse of the sexes becomes the most refined pleasure. What delight, for instance, must the great Badaeus have tasted, even in those works which must have been for others a most dreadful labour! his wife left him nothing to desire. The frequent companion of his studies, she brought him the books he required to his desk; she compared passages, and transcribed quotations: the same genius, the same inclinations, and the same ardour for literature, eminently appeared in those two fortunate persons. Far from withdrawing her husband from his studies, she was sedulous to animate him when he languished. Ever at his side and ever assiduous, ever with some useful book in her hand, she acknowledged herself to be a most happy woman. Yet she did not neglect the education of eleven children. She and Badaeus shared the mutual cares they owed their progeny. Badaeus was not insensible of his singular felicity. In one of his letters, he represents himself as married to two ladies; one of whom gave him boys and girls, the other was philosophy, who produced books. The lady of Evelyn designed herself the frontispiece to his translation of Lucretius. She felt the same pas-

sion in her own breast as animated her husband's, who has written with such various ingenuity. Of Baron Haller it is recorded that he inspired his wife and family with a taste for his different pursuits. They were usually employed in assisting his literary occupations; they translated manuscripts, consulted authors, gathered plants, and designed and coloured under his eye. What a delightful family picture has the younger Pliny given posterity in his letters! Of Calphurnia, his wife, he says, "her affection to me has given her a turn to books, and my compositions, which she takes a pleasure in reading and even getting by heart, are continually in her hands. How full of tender solicitude is she when I am entering upon any cause! How kindly does she rejoice with me when it is over! While I am pleading, she places persons to inform her from time to time how I am heard, what applause I receive, and what success attends the cause. When at any time I recite my works, she conceals herself behind some curtain, and with secret rapture enjoys my praises. She sings my verses to her lyre, with no other master but love, the best instructor, for her guide. Her passion will increase with our days, for it is not my youth nor my person, which time gradually impairs, but my reputation and my glory, of which she is enamoured."

MUSIC.

The study of the piano-forte, which comprises, within the compass of a single pair of hands, as much of harmony as is necessary to enjoyment, offers the greatest facilities to the improvement of the musical mind; and the amateur, who has accomplished sufficient variety of mechanical difficulty to play with freedom and ease, will find it more pleasing to extend her studies into the styles of masters, than to prosecute her practice on the piano-forte to a very high degree of perfection.—*Young Lady's Book.*

THE INDIAN GIRL'S LAMENT.

(From Poems by WILLIAM CULLEN BRYANT, an American Poet.)

AN Indian girl was sitting where
Her lover, slain in battle, slept;
Her maiden veil, her own black hair,
Came down o'er eyes that wept;
And wildly in her woodland tongue,
This sad and simple lay she sung:—
"I've pulled away the shrubs that grew
Too close above thy sleeping head,
And broke the forest boughs that threw
Their shadows o'er thy bed,
That shining from the sweet south-west,
The sunbeams might rejoice thy rest.
"It was a weary, weary road,
That led thee to the pleasant coast,
Where thou, in his serene abode,
Hast met thy father's ghost;
Where everlasting autumn lies
On yellow woods and sunny skies.
"Twas I the broidered moccasin made,
That shod thee for that distant land;
Twas I thy bow and arrows laid
Beside thy still, cold hand—
Thy bow in many a battle bent,
Thy arrows never vainly sent.
"With wampum belts I crossed thy breast,
And wrapped thee in thy bison's hide,
And laid the food that pleased thee best
In plenty by thy side,
And decked thee bravely, as became
A warrior of illustrious name.
"Thou'rt happy now, for thou hast passed
The long dark journey of the grave,
And in the land of light, at last,
Hast joined the good and brave—
Amid the flushed and balmy air,
The bravest and the loveliest there.
"Yet oft thine own dear Indian maid,
Even there, thy thoughts will earthward stray—
To her who sits where thou wert laid,
And weeps the hours away.
Yet almost can her grief forget
To think that thou dost love her yet.
"And thou, by one of those still lakes,
That in a shining cluster lie,
On which the south wind scarcely breaks
The image of the sky,
A bower for thee and me has made
Beneath the many-coloured shade.
"And thou dost wait the watch and meet
My spirit sent to join the blest,
And, wondering what detains my feet
From the bright land of rest,
Dost seem, in every sound, to hear
The rustling of my footsteps near."

BISHOP LEIGHTON.

This amiable personage, who was once Bishop of Dunkeld, in the reign of Charles II., was exceedingly charitable. One day as he was taking exercise in a secluded walk near the town, the widow of a poor clergyman, to whose support, and that of her children, his lordship had liberally contributed, broke in upon his solitude, and for a very strange reason. The good woman had been led to suppose that the real cause of the bishop's beneficence was a desire to make himself agreeable to her. Accordingly, when he asked eagerly after her children, under the impression that her intrusion arose from sudden distress on their part, she replied that they were all well, but she had been unable to rest till she disclosed to his lordship a remarkable revelation which had been made to her. "A revelation to you!" exclaimed the astonished dignitary. "Yes, my lord," said the woman; "it was revealed to me that your lordship and I are about to be married." "Indeed!" cried Leighton, "no such revelation, however, has yet been made to me: and if we are to be married by revelation, the marriage cannot take place, you know, until it is revealed to both parties."

REMARKABLE PRESENTIMENT OF DEATH.

"We were dispatched from the squadron in order to draw the attention of the American troops from Baltimore, whilst our army advanced upon Washington; and, consequently, we were engaged in some annoying and offensive operations every day and night."

We had, on the morning of the day on which the following event occurred, not only burnt, but robbed a house, from the parlour of which we had filched a mahogany table for our berth; we therefore got rid of our old oaken affair, and placed our ill-gotten furniture in its place. As this genteel apparatus was none the better for long neglect on shore, and the careless manner in which it had been handled in sending it on board, I, as the caterer of the mess—to which high situation I had been lately appointed—proposed that we should take it by turns to polish the table, in order to render it a proper bright appendage to our berth. Poor Sands, who was seated in a corner, looking wofully wretched, refused to assist; alleging as a reason, that he felt perfectly convinced he should never eat off the table, as that night he was to be killed. In vain I attempted to rally him from the strange melancholy which had overtaken him; he sat in a state of almost perfect stupefaction. I ordered some supper, of which, however, he would not partake, but, opening his desk, he made all his oldest friends a trifling present: to me he gave a silver knife, and, with a sad countenance, said, "I have nothing to send home; but my death will be severely felt there." We, not having exactly the same awful feelings as our messmate, burst into a fit of laughter, which however neither excited the resentment nor the spleen of poor Sands. At this time he was the only midshipman destined to remain on board, the rest being appointed to the different boats and different divisions of small-arm men, to be ready for service by nine o'clock. As it was requisite to avoid anything like suspicion in the eyes of our enemies (the frigate being placed within about pistol-shot of the shore), instead of using the boatswain's-mate's pipes to call the boats away, the order was merely whispered along the decks. Martin (who afterwards died in command of the *Nautilus*, I believe, in the Havannah) being asleep, and not being roused by the slight bustle, was absent when his boat was manned; and Sands, who had officiated in preparing the boats, was desired to command her in Martin's stead; thus he was thrust into service unprepared, and here he felt the certainty that his death was approaching. That morning Sir Peter Parker (the captain), in leaning backwards over the taffrail to make remarks upon the rigging at the mizen-top-gallant-mast head, let his laced cocked hat fall off. He said, very thoughtfully, and in a very unusual manner, "I much fear my head will follow this evening." From this moment he became thoughtful and reserved: he prepared his will with the purser; he destroyed his letters; he made several allusions to his wife and children; and at dinner—I dined alone with him that day—he was unusually reserved and dull; a kind of melancholy settled upon his countenance, and every feature indicated some secret foreboding awfully present to his imagination. Nine o'clock came; the boats were manned, and I, as his aid-de-camp, took my usual seat in his gig. All the boats left the ship at the same moment, and, with muffled oars and breathless silence, we approached the landing-place. When the gig's keel grated on the sand, and the boat stopped, I was surprised to find Sir Peter Parker remain motionless on his seat; and knowing his usual ambition to be first, I was rather slack in asking, which I was obliged to do, if I should land first. This awoke our chief from his lethargy; but, instead of walking over the gang-board, he stepped over-board alongside in the water, and walked on shore. The preparation of forming the men, selecting the advance-guard, and giving necessary orders, diverted Sir Peter from his melancholy, and he appeared as animated, and flushed with as much hope and confidence, as on any former occasion. Sir Peter Parker mounted a steed, and, turning round to his army, gave the word, "Battalion, advance!" Having some orders to deliver to the different officers, I passed to the rear, and on my return saw poor Sands; he expressed himself more and more satisfied that his end was approaching, and seemed only vexed at the idea of his marching a measured step to his inevitable destruction. I left him watchful as to his men, but irrevocably lost as to moral courage. To this moment Sir Peter Parker cheered on the marines with his usual determined courage; but now his voice failed, and he fell in my arms—a back shot had cut the femoral artery, and he was bleeding to death. "We sent on shore a flag of truce in the morning. The Americans were aware they had killed the Captain; for they produced his shoe, which had fallen from his foot. They likewise mentioned the death of poor Sands; a grape-shot struck him just above the heart."—*From the Life of a Sailor, in the Metropolitan for April.*

EFFECT OF MUSIC.

Major Denham, when in Africa, exhibited a musical snuff-box to the Sheikh of Bornou, who was greatly astonished, and exclaimed several times, "Wonderful, wonderful!" His feelings were completely overcome by the sweetness of a popular Swiss air. He covered his face with his hand, and remained silent; and a man near him breaking the charm with a loud exclamation, he struck him a blow, which made all his followers tremble. He asked "If one twice as large would not be better." The reply was, "Yes, but it would be twice as dear." He exclaimed, "It would be cheap if it cost a thousand dollars."

WAVES OF THE OCEAN.

The largest waves proceed at the rate of from thirty to forty miles an hour; yet it is a vulgar belief that the water itself advances with the speed of the wave. The form of the wave only advances, while the substance, except a little spray above, remains rising and falling in the same place.—*Arnott's Physics.*

PHENOMENON AT ST HELENA.

IN the year 1821 I was a midshipman in his Majesty's ship *Vigo*, guardship at St Helena, bearing the flag of Rear-Admiral Lambert, and commanded by Captain Thomas Brown, during the latter period of Napoleon's exile. I had charge of an excellent establishment on shore, called the stock-yard, for keeping a supply of fat cattle for the squadron after the arrival of the animals from the Cape, lank and lean. My party of men always slept on board, landing the next morning at day-light. It was in the early part of May, a month rendered remarkable by the death of the Great Chainman, which took place on the 5th day, that we were pulling in as usual in the launch, with several working-parties on board, but observing that the surf was too violent for the large boat filled with men to attempt a landing, we tried to accomplish it by a few at a time in the jolly-boat. A small number, including myself, got on shore in this manner. Shortly after, I was engaged in conversation with an officer of the Honourable Company's ship *Ganges*, surrounded by native women, some children, and Lascars, when I felt myself forcibly pulled by the arm, and heard a person exclaim—"Look at the horizon, run, save yourself, we shall all be lost!" I did look, and the sight I shall never cease to remember, it was so frightfully grand. On the horizon, from the north-west, appeared an immense undulation, or swell, resembling a bank of water rolling majestically in, directly in the wind's eye.—Whether it was my anxiety for the boats, or that astonishment had paralysed me, I cannot tell, but I felt rivetted to the spot alone, and before I could attempt to save myself, as others did by climbing the rocks, I was whirled along with the rapidity of lightning in the midst of this dark wave. Almost in an instant I experienced a violent shock, which stunned me for a few moments; on recovering the perfect use of my senses, I found myself in the armourers' cave, with the forge lying across my thigh. To this circumstance I must draw attention, as, by its weight keeping me from going into the sea as the water receded, and from being dashed against the rocks, to it I owe my preservation. Near me were lying two Lascars; one was split up the middle, the other's skull was beat to pieces—both were dead. Fearing a return of the surf, as the sea usually rolls in quickly twice, and then comes with a redoubled violence, I made the best use of my lungs; the carpenter fortunately heard my cries and rescued me. My clothes were torn to shreds, my ears, eyes, and nose filled with ashes and blood; but with the exception of a few contusions, and lacerated hands, I was otherwise unhurt. One woman was drowned, and several men and children were picked up by the boats. This first swell that I have mentioned was the prelude of a gigantic surf, which lasted three days. This phenomenon (as nothing like it had ever taken place in the memory of the oldest inhabitants) was attributed to an earthquake. We had only telegraphic communication with the ship while it lasted. The fortifications were much injured in front of St James Town; huge rocks were torn up and tossed into our little bathing-place to the left of the landing; the guard-house was abandoned, the sea reaching the upper windows; the ships were rode with sails aback to keep them astern of their anchors; and, while it lasted, to see the mass of water burst upon the cliffs, as if to shake the island from its foundation, was the grandest sight I ever beheld. There may be some who would connect such a singular occurrence with the last days of the expiring Emperor. Croly, if I recollect right, in his finely written history of George the Fourth, speaks of his soul taking its flight amidst the noise of the tempest and roar of the surf, comparing it to the crash of a battle and armies meeting.—*United Service Journal*.

FIGHTS OF WILD BEASTS.

CAPTAIN MUNDY, in his work on India, presents us with the following interesting account of certain fights of wild beasts at Delhi:—

"His majesty, before he retired, informed the commander in chief that he had given orders for the wild-beast fights to be prepared for his edification on the morrow; and as these sports are celebrated for the grand scale on which they are conducted at Lucknow, we were all very anxious to witness them. Early in the morning, therefore, the whole party, including ladies, eager for the noble spectacle, mounted elephants, and repaired to the private gate of the royal palace, where the king met the commander-in-chief, and conducted him and his company to a palace, in the park in one of the courts of which the arena for the combats was prepared. In the centre was erected a gigantic cage of strong bamboos, about fifty feet high, and of like diameter, and roofed with rope-net-work. Sundry smaller cells, communicating by sliding doors with the main theatre, were tenanted by every species of the savagest inhabitants of the forest. In the large cage, crowded together, and presenting a formidable front of broad, shaggy, foreheads, well armed with horns, stood a group of buffaloes sternly awaiting the conflict, with their rear scientifically *appuyé* against the bamboos. The trap-doors being lifted, two tigers, and the same number of bears and leopards, rushed into the centre. The buffaloes instantly commenced hostilities, and made complete shuttlecocks of the bears, who, however, finally escaped by climbing up the bamboos beyond the reach of their horned antagonists. The tigers, one of which was a beautiful animal, fared scarcely better; indeed, the odds were much against them, there being five buffaloes. They appeared, however, to be no match for these powerful creatures, even single-handed, and showed little disposition to be the assaunders. The larger tiger was much gored in the head, and in return took a mouthful of his enemy's dewlap, but was finally (as the fancy would describe

it) 'bored to the ropes and floored.' The leopards seemed throughout the conflict sedulously to avoid a breach of the peace. A rhinoceros was next let loose in the open court-yard, and the attendants attempted to induce him to pick a quarrel with a tiger who was chained to a ring. The rhinoceros appeared, however, to consider a fettered foe as quite beneath his enmity; and having once approached the tiger, and quietly surveyed him, as he writhed and growled, expecting the attack, turned suddenly round and trotted awkwardly off to the yard-gate, where he capsize a palanquin, which was carrying away a lady fatigued with the sight of these unfeminine sports. A buffalo and a tiger were the next combatants: they attacked furiously, the tiger springing at the first onset on the other's head, and tearing his neck severely, but he was quickly dismounted, and thrown with such violence as nearly to break his back, and quite to disable him from renewing the combat. A small elephant was next impelled to attack a leopard. The battle was short and decisive; the former falling on his knees, and thrusting his blunted tusks nearly through his antagonist. On our return from the beast-fight, a breakfast awaited us at the royal palace; and the white tablecloth being removed, quails, trained for the purpose, were placed upon the green cloth, and fought most gamely, after the manner of the English cockpit. This is an amusement much in fashion among the natives of rank, and they bet large sums on their birds, as they lounge luxuriously round, smoking their hookahs. Elephant fights were announced as the concluding scene of this day of strife. The spectators took their seats in a long veranda. The narrow stream of the river Goomty runs close under the palace walls, and on the opposite bank a large, open, sandy space presented a convenient theatre for the operations of these gigantic athletes. The elephants educated for the arena are large, powerful males, wrought up to a state of fury by constant feeding with exciting spices. On the spacious plain before us we counted several of these animals parading singly and sulkily to and fro, their mahouts seated on their backs, which were covered with a strong network for the driver to cling by in the conflict. In attendance upon every elephant were two or three men, armed with long spears, a weapon of which this animal has the greatest dread. We soon discovered two of the combatants slowly advancing towards each other from opposite sides of the plain. As they approached, their speed gradually increased, and they at length met with a grand shock, entwining their trunks, and pushing, until one, finding himself over-matched, fairly turned tail, and received his adversary's charge in the rear. This was so violent, that the mahout of the flying elephant was dislodged from his seat; he fortunately fell wide of the pursuer, and escaped with a few bruises. Five or six couple were fought, but shewed little sport; the sagacious animals instantly discovering when they were over-matched. I had long been ambitious of witnessing the far-famed wild-beast fights of Lucknow, and having enjoyed an opportunity of seeing them, which few have had, it would hardly be fair to say that I was disappointed. Before the party left the palace, his majesty took a great fancy to a hookah belonging to one of the staff. It was formed on an entirely new principle; and the king was so smitten with the novel invention, that he signified his royal wish to purchase it, and immediately carried it off, to display its charms to the three hundred and fifty fair inmates of his zenana. In the evening a Piedmontese conjuror, in the pay of the nawab, entertained us much by his ingenious tricks. He must be a useful fellow to amuse the vacant mind of an Eastern despot."

ODDS AND ENDS.

'Tis here all meet.—BLAIR.

A FIRST-RATE anchor weighs about three tons, employs twenty men for forty days in making, and costs £400.—The celebrated Dr Cullen was born at Hamilton, in Lanarkshire, in the year 1710.—The milk of the whale produces cream much richer than that of the cow, and a joint-stock company to establish a whale-cheese manufactory at Spitzbergen or the North Pole would certainly be a capital speculation.—Children may be hanged in England at twelve years of age, and married in Scotland at fourteen.—The people of Hampshire singe the bristles off their pigs instead of scalding them, and in this lies the secret of the excellence of the Hampshire hams.—While Columbus was engaged in discovering America, Henry VII. of England, and James IV. of Scotland, were entering into a treaty, which ultimately led to the union of the two kingdoms.—It was in the town of Dumfries that Kean first gave an earnest of that professional eminence to which he afterwards attained.—The last three Dukes of Athol planted altogether upwards of fourteen millions of larch and other trees.—The eagle which the Americans have chosen for the emblem of their nation is described by Audubon to be an exceedingly mean and cowardly animal, and Franklin laments that such a bird should have been selected for so honourable a purpose. It is thirteen hundred years since the first house in Edinburgh was built; Glasgow is of an equal antiquity.—Mrs Jordan was an Irishwoman, and was born in the neighbourhood of Waterford, about the year 1762.—At the time when Addison was writing the Spectator, the Scotch were burning witches.—At the period that the peasantry of England were burning thrashing mills, those in Scotland were establishing scientific and literary associations.—Upwards of forty-three millions of quarters of corn were imported into Great Britain in 1831.—The origi-

nal name of Paul Jones was John Paul.—"At the Cape of Good Hope," says a traveller, "people die very fast; but the sheep have remarkably large tails."—Cervantes, the author of *Don Quixote*, was a slave, and fought at the battle of Lepanto.—Corns may be effectually extirpated by placing on them the scrapings of chalk mixed with vinegar.—The distance from the Land's End to Charlotte Town in Prince Edward Island is 2280 miles.—Madden mentions that the walls of Constantinople could not endure a siege of six hours.—If milk be put into vessels lined with or formed of zinc, a much greater quantity of cream will be raised than in common vessels, and the butter will be of a finer quality; why is this not practised?—Bordeaux is situated on the navigable river Garonne, about 75 miles from its mouth, and has a population of 100,000 inhabitants.—Sobieski saved Christendom from the Mahomedans about the time that Claverhouse and Balfour were fighting the battle of Drumclog.—The chief products of Owhyee are arrow-root and cocoa nut oil.—There is not a protestant place of worship in Ireland in which the native Irish tongue is preached.—All the copies of Tacitus are copied from a single manuscript, discovered in a monastery in Westphalia.—Hyder Ali died in 1782.—The population of the United Kingdom in 1831 was 24,266,989, being an increase of 14½ per cent. since 1821.—Erasmus composed in a post-chaise.—The offices in London calculate upon one alarm of fire every day, and about thirty-two serious fires every year.—There is a superstition in the west of Scotland that the earth of the parish of Rosneath kills rats, and none of these animals can live in the district.—A west India proprietor once imported a ship-load of this earth to clear his plantations of that species of vermin, but the experiment is said to have failed.—The sum of thirteen-pence half-penny is called *hangman's wages*, because the fee of the executioner used to be a Scottish merk, or thirteen pence and the third of a penny.—Auctions were first introduced into England in the year 1700.—In Spain, in the year 1826, there were 1233 men committed for murder, 1773 for attempts to commit murder, and 1620 for robbery.—The annual export of paving stones from Arbroath, a seaport in the east coast of Scotland, is from 400,000 to 500,000 superficial feet.—In the year 1565, Mary Queen of Scots sent a boy from Edinburgh to Musselburgh on an errand to the magistrates, and the fee she paid him was a Scots shilling, or a penny sterling.—The scenting matter called musk is found in a small bag under the belly of a species of deer inhabiting the alpine mountains of the east of Asia.—The palace of the Tuilleries, in Paris, takes its name from a tile work once situated on the spot.—Handel was blind for eight years before his death.—When you buy a horse, avoid those having flat feet and low heels.—The city of Pompeii was overwhelmed with showers of lava, or ashes, from Vesuvius, in the month of August, in the year 79, and remained buried for 1676 years.—In the state of New York 237 different newspapers are published.—The humorous production, *Monsieur Tonson*, was written by a Mr Taylor, a gentleman of the press in London, now deceased.—If Lander and his companions, with their flat-bottomed steamer, reach in safety the quay of Timbuctoo, the natives may look for the arrival of guns, turnips, whisky, acts of Parliament, and the small pox, in about three years thereafter.—Ben Nevis rises 4370 feet above the level of the sea.—

"Frenchmen are mostly born in France,—

Mousetraps are not county jails,—

Turkeys are seldom made to dance,—

They don't stuff geese with copper nails."

PRIVILEGES OF THE KING'S SMITH.

One of our historians observes that, immediately preceding the Conquest, the art of working in iron and steel had arisen to such a state of improvement, that even the horses of some of the chief knights and barons were covered with steel and iron armour. Artificers who wrought in iron were so highly regarded in those warlike times, that every military officer had his smith, who constantly attended his person, to keep his arms and armour in order. The chief smith was an officer of considerable dignity in the court of the Anglo-Saxon and Welsh kings, where he enjoyed many privileges, and his wergeld was much higher than that of any other artificer. In the Welsh court, the king's smith sat next to the domestic chaplain, and was entitled to a draught of every kind of liquor that was brought into the hall—a privilege which many artificers of his class in our own day will not be disposed to make light of.—*Lardner's Cyclopaedia*.

Mr Chambers has much pleasure in announcing that the weekly impression of the Journal, in Edinburgh and London, now amounts to FIFTY THOUSAND COPIES. As the reprinting of the early numbers has hitherto been a most serious drawback on the paper, operations are now in progress to stereotype every number as it occurs, by which means sets of the Journal may at all times be obtained. The stereotyping process will take place in Edinburgh, and as duplicates of the plates will be transmitted weekly by mail to London, and there, by means of steam-presses, subjected to an impression of twenty thousand or more copies in a few hours after their arrival, the art of printing, in this humble periodical, will have secured a triumph altogether unparalleled in this or any other country.

EDINBURGH: Published by WILLIAM and ROBERT CHAMBERS, Booksellers, No. 19, Waterloo Place.

IN LONDON, an Edition is published, with the permission of the Proprietors, by W. S. ORR, Paternoster-row, for circulation throughout England, Wales, and Ireland.

Stereotyped by ALBX. KIRKWOOD, South St Andrew Street, And printed by W. RITCHIE & Co. Edinburgh.

PRICE THREE HALFPENCE.

CONFESSORS.

It is a very general impression, that the system of auricular confession was given up at the Reformation. Such is by no means the case: every man and mother's son in the country still keeps his *confessor*. By this epithet, it may be guessed, I mean that chief and most particular friend whom every man keeps about him—who stands his best man when he is married, and becomes his second when he fights a duel—his double, in short, or second self—a creature whom you almost always find with him when you call, and who either walks under his arm in the street, or is found waiting for him while he steps into some neighbouring shop, or, as the case may happen, is waited for by him.

I make bold to say, there is not a trader any where who does not keep his confessor. The creature haunts the shop, till he almost seems the Genius of the Place, to the grievous prepossession of newspapers, and, what is more intolerable still, to the exclusive occupation of the ear of the worthy shopkeeper himself. The evening is the grand revel-time for confessors of this genus. Between eight and nine, you see them gathering to the shops of their respective victims, like fowls to roost. As you pass about nine, you observe, on looking in, that the discipline and rigour of shop-life has dissolved. Master, men, and boys, feel the approach of the moment of emancipation, with a peculiar salience of thought, alternating with a deep and tranquil delight. The confessor reigns in the spirit of this glorious hour, and his laugh, and his joke, and his news, and his proffered pinch, are listened to, repeated, and partaken of by his devotee, with a pleasure of the keenest nature, and ominous, you may make sure, of oysters and gin punch on the way home.

In some shops, confessors cluster like grapes over a vintner's door. They block up the way of custom; and it is evident, in many cases, that the devotee would rather lose the chance of a penny from a customer, by omitting opportunities of attack, temptation, and inveiglement, than lose the joke that is passing in the merry circle of his confessors, which his ear drinks in as a precious *aside*, while he only can spare a mere fragment of his attention—a corner of one auditory organ—the front shop of his mind—to the real business before him. In some shops confessors get no encouragement before dinner. The broad eye of garish day, in those fastidious establishments, could no more endure such a walking personification of idle gossip, than a ball-room, at high twelve, could tolerate the intrusion of a man in a short coat, with a pen stuck in his ear. But this is by no means the general case; and even in some instances where the front shop will not admit of such an appendage, ten to one, but, if the premises were well ransacked, you would find a specimen of the class snug in some out-of-the-way corner, filling up the greater part of his time with a newspaper, but every now and then resorted to by his votary, in the intervals of actual employment, like an Egeria receiving the visits of a Numa, and no doubt administering equally precious counsel.

The more common position of a shopkeeper's confessor is a chair opposite the door, whence he may command a view of all that passes in the street, with a full front inspection of every individual that makes bold to enter. Into this chair the confessor invariably glides as a matter of course. There he sits down, and, throwing one limb over the other, considers himself entitled to inflict his company upon the unhappy shopkeeper for any length of time. He notices, as if he were not noticing, all that goes on in the premises. Not an order is given for goods, not a payment made, or a pennyworth sold, but it is seen, and very likely made the subject of after comment. It is of no consequence to the confessor what description of customers enter the place. Were a princess of the blood to come in, he would keep his seat and his countenance equally unmoved, and a whole band of ladies, driven in to escape a shower of rain, will not stir him from the chair, to which he seems nailed, like the marble prince of the Black Islands, in the Arabian Nights' Entertainments. The customers very naturally feel disinclined to patronise a shop which is thus, as it were, haunted by an evil spirit. Oh, how I do hate to enter that shop of Mr Such-a-thing, says one young lady to another, for every thing you do or say is noticed by that odious person who is always lounging there. And in this manner Mr Such-a-thing loses his business, almost without the

possibility of recalling it. He longs to discover a means of disposing of the confessor, but he finds a great difficulty in accomplishing his purpose. He is disinclined to be churlish to a person to whom he has confessed himself for years. Still he makes an effort. He grows cool in his civility, and makes a point of being always busy on his arrival. Perhaps he has the good luck, at length, to shake off this pest of his premises; but it is more than probable that he submits to the terrific infliction for life, his confessor only leaving him when he is fairly in his grave. I once knew a dreadful case of confessorship, in which the shopkeeper had the hardihood to expel his visitant, and by a plan so ingenious, that I think it worth while to advert to it. The shop contained four chairs, including the confessional, which stood opposite the door. One day when the confessor arrived, and, as usual, proceeded to his seat, he was a little surprised in remarking that it was filled to a pretty good height with parcels of some kind or other. But as this appeared naturally enough to be caused by a press in the stock of goods, no observation took place regarding it, and another chair was selected. However, next day when he again appeared, another chair was found covered up in a similar manner. The following day, he even found a third filled with parcels; and on the fourth day the whole were thus engaged. The confessor now saw that a conspiracy had been formed to destroy his functions, and to expel him from his ancient settlements. Like the unhappy antediluvians, who, as the flood arose, were driven from one spot of earth to another, and at last did not find a dry piece of ground whereon to rest their foot, so the unhappy confessor had been driven from chair to chair, till at last he could not discover a place whereon he could plant himself. A pang of vexation shot through his heart; a gleam of mingled shame and indignation passed over his countenance; and, with a last look of despair, he burst from the shop, and "ne'er was heard of more."

It must be allowed that some men do not stand so much in need of confessors, or do not indulge so much in them, as others; but, upon the whole, it may be taken as a general rule, that no man can altogether do without such an *official*. In the fair on-going business of life, one acts *suo more solito*, according to one's regular custom of trade, or by the common rules of the world. But occasions occur, where common practice does not furnish a rule. You are in love, and wish to interest a friend in your passion; you are about to marry, and require information about arrangements, and also some one to stand beside you, and pull off your glove, preparatory to the ceremony; you have a quarrel, and need a third party to tell you that you are in the right; you are about to enter into some commercial or other enterprise a little beyond your usual depth, and find it necessary to fortify your resolution by the sanction of a friend; or you write a poem or novel, and require to have somebody to read the manuscript, and tell you that it is sure of success. In all these cases, the confessor is indispensable. *Without him*, you would be crossed in love; get stranded in the straits of matrimony; permit yourself, after giving offence and insult, to let off the object of it with impunity for his remonstrance; break down in your new business scheme; and let your manuscript waste its sweetness on the desert scrutoire. But *with him*, all goes smooth.

Upon the whole, it is better that one's confessor should be a little poorer, as well as a little more plausible in speech, than one's self: he ought to be a man to whom meat and drink are things of some account—a broken-down Scotch licentiate—an author who has published respectable books which have never sold; in short, some idle, poor, servile individual, to whom it is of the last importance to get a good grazing ground in the back premises of a substantial trader, upon whom he may revenge that partiality of fortune, which decrees all the real comforts of life to the mercantile and common-place, while the real "clever fellows" starve.

But, after all, it must be allowed that there is a great deal of confessorship in the world, independent of a regard to cake and pudding. It is in many cases simply a fascination exerted over one mind by another; in others, the result of that very common failing, the want of confidence in one's own resources. Young men—by which I mean men in the mason-lodge time of life, say between twenty and five and

twenty—are most apt to indulge in confession. *They* think friends all in all, and for friends would give up every thing. All business and duty is to them an episode, only consented to because it is unavoidable; while the enjoyment of the countenance of their friends seems the main and true concern of life. Then are the joys of confession truly relished. Then does the vampire confessor suck deepest into the vitals of his devotee. Happy delusion—sweet morning dream—alas! too certain to wake to the conviction that it is "but a dream!"

POPULAR INFORMATION ON NATIONAL INSTITUTIONS.

BANKING INSTITUTIONS.

THE institutions which have been established in different quarters of the empire, for the purpose of manufacturing and disseminating paper notes as the representatives of solid property or coin, are of that peculiar and interesting description which may well serve to excite the inquiry of those who are entering on the busy scene of a mercantile life. Establishments with designs of this nature have been formed, chiefly since the development of the national energies at the revolution of 1688, over the united kingdom of England, Scotland, and Ireland; but it may be impartially stated, that it is only in Scotland that banking has been carried to the height of its perfection, and erected on a basis of the most absolute security. Why the English and the Irish have failed in perfecting their systems of paper money, we need not stop to inquire with minuteness. Perhaps it has been owing to the habits and character of the people, perhaps to the comparative extensiveness of their country, or perhaps to the existence of legislative enactments injurious to a perfect and salutary freedom of trade.

Most of the peculiar institutions of the Scotch have been produced from the force of particular circumstances; and it is very possible that they have sometimes succeeded in the ends of their establishment, when the same result would not follow their erection in many other territories. The nature and limited extent of the country, the reflective habits of the people, and the long impoverished condition of the nation, have given a decided turn to the modes of action of the inhabitants. In the absence of real wealth, they have been driven to various expedients to keep on a level with their neighbours; and to this cause alone may we attribute, in a great measure, their success in processes of banking. Nevertheless, it is obvious that the measures which have been judiciously resorted to for the purpose of accomplishing a thorough paper currency in Scotland, may be adopted with propriety by other nations; but before they attempt to do so, I would recommend a patient investigation into some other accessory institutions in the country—for instance, the law of attaching heritable property for debt, and the practice of public registration, which contribute in an extraordinary degree to give strength and stability to our system of paper currency.

It has been established as a principle in poeconomy, that money, or coin, is not in itself w. It is only the representative of a commodity w from its bulk, cannot be carried about, or of the wages of labour. The real wealth of a nation is the amount of its improved lands, the produce of its agriculture, its manufactured goods, and its industrious habits. If it want the latter, it will soon go to utter poverty, whatever be the quantity of coin it happens to have. At the revolution of 1688, or thereabouts, Scotland was much in the condition of a newly-discovered country. It had lands, but they were not improved, and consequently of little use; it had very little produce of any kind; and its people were by no means industrious in their habits. At that period they were of a slothful speculative turn of mind; yet they did not want a number of persons among them who were endowed with the most patriotic motives, and who volunteered to rouse and direct the dormant energies of the country. But nothing could be done without money, or its representative. To plough the fields and drain the morasses, it was necessary to pay those employed in the task. The landlord of 1000 or 10,000 acres of hill and dale said, I am anxious to bring my lands into cultivation, and to make them produce crops of corn, but I have no horses, nor machinery, not houses for labourers, and, to tell the truth, I have enough ado to keep my own family in food and cloth-

ing. However, he continued, if I could get credit for some ploughs, harrows, horses, and other essentials for carrying on some improvements, I would begin to clear my lands immediately, and I would certainly pay back what I had got, at the end of one or two years; for before that time I would have raised a considerable produce from the ground. This was the outcry of nearly all the landed proprietors in Scotland. They wanted credit. It may be asked, why did they not purchase what they wanted on credit? The reason of this was, that the makers of ploughs and other machinery, and the dealers in different kinds of goods, were as poor as themselves, and could not afford to give away the articles on the faith of a future payment. The thing now to be desired was promissory notes, which, by being given by the landlords to the manufacturers and people they employed, these again could give them to the people they employed, and so on and on through a variety of hands. But as the issuing of promissory notes by private gentlemen could serve little purpose, as the issuers could not be very widely known or trusted, a necessity arose for establishing a national bank, or an institution empowered to manufacture and lend notes on a great scale, and the payment of which would be guaranteed by a large body of individuals, each of considerable wealth, and each a depositor of so much coin, to lie in the bank, in order to pay the notes that chanced to come back to the establishment. The notes to be put forth, it will be seen by my young readers, were thus to bear a double character: they were to be the convenient representatives of credit, as well as the representatives of solid property, pledged by the large body of individuals who originated the bank. Such being the principle on which Scottish banking originated, and such being still its prominent characteristic, I proceed to state when and how the first bank was established.

The project of a bank to effect the purposes just alluded to, was hailed with acclamation by the most patriotic landowners and citizens; and in 1695, the scheme of its constitution being submitted to King William and the Scottish Parliament, it was sanctioned by both, and the bank was instituted by a charter of incorporation, under the designation of the BANK OF SCOTLAND. The capital of the bank (or the money to be paid in to meet the payment of notes when they came back) was named at L.1,200,000 Scots, or L.100,000 sterling, which would be reckoned a very small sum in modern times. The amount was raised by shares differing in extent, from L.1000 Scots, or L.83, 6s. 8d. sterling, to L.20,000 Scots. In 1774, the amount of stock was extended to L.200,000 sterling; and now it is a million and a half sterling. The shares still remain at L.83, 6s. 8d.

The establishment of the Bank of Scotland was of great service to the nation; the landholders borrowing notes and bringing the country into cultivation, and a spur being by that means given to various branches of manufactures. The Bank of Scotland continued to be the only bank in the country till the year 1727, when a new and similar establishment was constituted, under the title of the ROYAL BANK OF SCOTLAND. These two establishments engrossed all the respectable banking business in the country till the year 1746, when a new association was formed, and incorporated by royal charter, with the title of the BRITISH LINEN COMPANY. The peculiarity in the designation of this banking-house deserves a word of explanation. Hitherto the manufactures of Scotland, though partially developed by the above banks, remained in a very backward condition, and in an especial manner the manufacture of linens, for which the country was well adapted. In order to encourage the manufacture of linen, a number of individuals were incorporated under the aforementioned title, with power to raise a capital by shares, to the extent of L.100,000. The company itself did not take a part in the manufacturing of cloth; it only promoted it among others, through the aid of loans. Its salutary advances in this way soon wrought a great change among the working classes, and powerfully assisted to raise the character of Scottish linens to that pitch they have now acquired. The company gradually fell into the course of common banking business, and now occupies a high station among these institutions. From L.100,000, the capital of this bank has been raised to L.500,000, where it has long remained stationary. By very adroit management, it carries on a very great deal of business, and possesses as high credit as any bank in Scotland. It is understood to have been exceedingly fortunate in purchasing government stock at very fortunate periods. For many years its stock has been of a much higher value than that of any other company in the kingdom.

These are allowed to take precedence of others erected in the subsequent part of last, and in the present century, either in Edinburgh or in the provinces. Of the other banks, there are two kinds: one constituted by an extensive copartnership of shareholders, on the principles of joint-stock companies; and another, composed of only a few wealthy partners. Among these, the bank of Sir William Forbes and Company stands prominent for its age and respectability. Of the former description, there are at present upwards of thirty; and of the latter, there are five. All the banks issue notes, with the exception of three of the last named, which act more as bill-broking institutions than banking-houses.

The constitution and internal arrangements of the different Scottish banks are by no means alike; yet in general features they are the same, and in many

cases the only difference lies in the official designations of the functionaries.

The number of partners in these institutions is various, and depends generally on the price of the shares, or the amount paid in upon them. It sometimes occurs, that a provision is made that one person shall hold only a limited number of shares, and the votes of holders are regulated by a graduated scale. It is very difficult to say what may be the exact number of shareholders in any of the banks, as it must vary continually by the transfer of stock from one to many hands, or the reverse. It may give an idea of the number, however, when I state, that some time ago there were 1238 partners in the National Bank—500 in the Commercial Bank—446 in the Aberdeen Town and County Bank—and that in three of the remaining banks, the number exceeded 100—in six it varied from 20 to 100—and in seventeen was below 20.

It seems to have been a principle in Scottish banking from the very first, to institute shares of a certain amount, and only to call up portions of the same as is felt to be necessary or convenient. In the Bank of Scotland, and the other two first-mentioned banks, the whole amount of the shares is paid up. But this is far from being the case with most others. With respect to the Commercial Bank, in which the nominal value of the shares is L.500, a fifth part, or L.100 per share, is paid in; and of the National Bank shares of L.100 each, L.10 is only paid. The amount of paid-in capital, in general, bears no feasible proportion to the nominal capital. It hence follows that, but for subsidiary checks, a danger would ensue of lowering the respectability of the holders of shares.

In the greater proportion of Scottish banking institutions, the shares have risen much beyond par. The original holders of stock, therefore, or their successors by inheritance, draw large profits from their shares; and in many instances they gain from seven to nine per cent. on their sunk capital. When shares have been acquired by purchase in recent times, the percentage, by reason of the heavy premiums paid, may be stated at about three and a half per cent. or thereabout. The amount of premium paid in purchasing shares has been known to be immense. In 1825, when the mania for holding shares in companies was at its height, the L.100 shares of the British Linen Company sold for no less than L.325—the L.83, 6s. 8d. shares of the Bank of Scotland for L.240—the L.100 (paid in) shares of the Commercial Bank for L.227—and the L.100 shares of the Royal Bank for L.235.

Dividends of the profits of Scottish banks are paid twice a year, after public advertisement has been made. But besides these half-yearly per centages, the partners or shareholders in most banks receive bonuses at intervals of from seven to ten years, generally to the amount of from L.10 to L.20 per share. Such monies are raised by the accumulation of a sinking fund, laid apart after the interest or per centage has been declared annually, in order to meet runs, should such occur; and as it is rarely that these funds are acted upon, they are of course dissipated either in whole or in part at approved periods.

No shareholder in any bank can dispose of his stock until it has been first offered to the bank in its corporate capacity, as represented by its trustees. The broker employed to sell shares must in all cases primarily offer them to the bank, and if it do not accept of them at the market price, the broker is told that he may dispose of them otherwise, which, when he does, the transfer is not complete until the name of the new owner is registered in the bank books. The real use of a provision of this nature, is for the sake of security against injury by the seller. To make this sufficiently understood, it has to be explained, that it is customary, in forming new banks in Scotland, to offer subscribers for shares a liberty of a half or third of the capital they pay in.

It is extremely probable that many are led to buy shares in banking institutions who could not well spare the whole price for any length of time; but it has the effect of procuring at once a number of good customers, who take care to keep the notes which are produced in circulation. Besides, the bank never can lose by lending these people money, because it has their paid-in stock in security, and, on this account, when they wish to sell out, by being made aware of their intention, it can thereby refuse to permit the sale till all debts which may be due are paid to the establishment. Before the licence is given to sell, all their accounts must be balanced, and every bill they have had negotiated by the bank, as drawers, acceptors, or indorsers, must be honoured.

The business done by the Scottish banking-houses is prodigiously increased by the institution of branches in the provincial and country towns. From those banks already noticed, which are situated in Edinburgh, and from two or three of the chief provincial banks, there were altogether deputed not long since about one hundred and forty branches, and this number is undergoing a regular increase. These subsidiary establishments are to be found in every town of any note; from the borders to the most northern point of Scotland. They are conducted by resident wealthy or responsible merchants and others, who give securities for intrusions, and are subjected to a very rigorous supervision by inspectors, who are continually travelling about for this purpose. By a mutual agreement between the Bank of Scotland and the Royal Bank, rivalry is prevented in agencies, by the former being conceded the minor towns, while the

latter takes the city of Glasgow. The branch of the Royal Bank at that place, it has been long understood, does much more business than the parent establishment; but there can be little doubt that the institution of the Union Bank there will greatly injure its issues in that quarter. The number of branches belonging to different houses, varies according to the enterprise or capital of the companies. The Bank of Scotland had lately seventeen, the British Linen Company twenty-eight, the Commercial Bank thirty, and the National Bank eighteen. The conductors of the branch banks give no loans or negotiate any heavy transactions without consulting with their masters. They keep beside them at all times a competent supply of notes, with which, on most occasions, they may discount bills, according to their own judgment.

The expressed value of the notes put forth by the Scottish banks is for the greater part L.1, and though notes for five, ten, twenty, and a hundred pounds, are issued, they are seldom long in circulation, and are far less frequently seen. The notes of the Commercial Bank, the National Bank, the Bank of Scotland, the Royal Bank, the British Linen Company, and Sir William Forbes and Company, enjoy the greatest circulation, and in a greater relative proportion, I would suppose, to their priority in the above order. They are dissipated over every county; and it is seldom that the notes of provincial banks are taken so readily from their place of issuing: provincial bank notes are at least not common in the metropolis, and their circulation is for the most part of a local nature; the community at large preferring the notes of Edinburgh bankers. All notes are declared to be payable on demand at the office from whence they are issued. It is not expressed that, though issued by the branches, they will be cashed there; yet, in practice, the agents take them in, and I never heard of an instance of the public having suffered by this provision, which is not commonly adverted to. It was at one time ordained that Scottish bank notes should not be re-issued after they were three years old, but such a regulation is abrogated, and they are now sent out as long as they are in good condition. Each of the one-pound notes costs about eight-pence, five-pence of which sum goes for the stamp. Almost all the modern notes are produced from plates of hardened steel, and of such peculiar and intricate devices, that forgery cannot be attempted with success, or remain long undetected. So little is forgery known, and in general so readily can it be recognised by the inferiority of workmanship, that nobody is imposed upon but very simple or careless persons.—*To be continued.*

THE NORTHERN LAKES.

AGAIN we find ourselves traversing the wild scenery of the Western and Northern Highlands, wandering through the gloomy recesses of the glens and passes, and pausing on the noon-day beauty of the lovely lakes of Caledonia. What a remarkable stretch of lakes do we find in the Great Glen of Scotland—Glenmorenan-Albin, as it used to be called by the Celtic inhabitants of these regions, and now suited to purposes of inland navigation, as the Caledonian Canal. At the bottom of this strath, extending from one side of the island to the other, a distance of about sixty miles, lie Loch Ness, Loch Oich, and Loch Lochy, with the rivers and artificial channels joining them in a continuous line. Loch Ness, the most northerly of the series, is a lake possessing some mysterious and even terrible characteristics. It extends about twenty-two miles in length, by a breadth of from half a mile to one and a half, but more generally nearly a single mile. Its depth is considered to be greater than most parts of the sea between the northerly part of Scotland and the north of Europe, measuring in some places 185 fathoms, and throughout its whole length, except at two points, being able to sail a ship of the line, close upon the shore. It stretches along in a perfectly straight line, between two lofty piles of hills, which rise steep as walls to a prodigious height; and the tourist looks along it from one end to the other, as through a telescope. This lake has the remarkable property of never freezing in the severest winter, and in frosty weather is covered with a thick mist, having the appearance of a dense smoke; and it is usually agitated violently when any other part of the world is undergoing the phenomena of an earthquake. This remarkable peculiarity was particularly observable on the 1st of November 1775, at the time of the great earthquake at Lisbon. The water rose rapidly, and flowed up the lake with amazing impetuosity, the waves being carried more than two hundred yards up the river Oich, breaking on its banks five feet above the level of the river. It continued ebbing and flowing for about an hour; at the end of which time, a wave much greater than the others terminated the commotion, overflowing the north bank of the lake to the extent of thirty feet.

Loch Ness is fed by a number of tributary streams; among others, the water of Foyers, or Fyers, on its south side. The water of Fyers and its falls form the chief wonder in this part of the country, and have long been an object of attraction to travellers proceeding by the Caledonian Canal. The river rises in a mountainous region in the district of Badenoch, Inverness-shire, and flows in a northerly course for about ten miles, through a vale abounding in beautiful scenery, to Loch Ness. At a short distance from its embouchure, it arrives at two precipices, down which its waters are necessarily poured. The upper

fall is the smaller, and nearly half a mile above the lower. The former fall makes three leaps down a fearful gulf into a pool beneath. A stone bridge, unfortunately in an unsuitable taste, has been thrown across the ravine in front. The lower fall is that which chiefly attracts attention. The water, after flowing through a narrow rocky channel, suddenly makes a sheer unbroken descent of two hundred and twelve feet. From the top of the adjoining rocks, bristling with shrubbery and bedewed with the soft spray of the descending waters, to the surface of the troubled pool beneath, the height is four hundred and seventy feet. The appearance of this cataract is truly grand. Ideas of the magnificent efforts of nature connected with feelings of romance, fill the mind of the tourist; and as he scrambles down the face of the verdant precipices, or looks aloft from the green esplanade at the bottom, he confesses, amidst the din of the rushing waters, that in Scotland are found scenes not too fondly praised in the patriotic rhymes of its bards, and surpassed by those of few foreign and similar lands.

Loch Oich, the next in the chain of lakes, is an exceedingly beautiful sheet of water, measuring about four miles in length. The banks here slope gently to the water, forming a number of beautiful bays, and possessing several pretty islets, mostly covered with wood. Loch Lochy, the most westerly of the whole, extends fourteen miles in length, and is likewise envied by some striking Highland scenery.

Since we are at this part of the country, we may, if the kind reader be not too much fatigued, take a stretch eastward towards the river Findhorn, where there are several small lakes of some beauty, and not destitute of historical interest. Of these little gems in the rugged wilderness, none pleases us so much as the pretty lake of Moy. The lake of Moy is situated in the pastoral united parish of Moy and Dalarossie, on the left bank of the Findhorn, and extends two miles long by three-quarters of a mile in breadth. This small expanse of water is not without its islands, and, as in every instance, it is the islands which afford the greatest interest to the spectator. The lake, the trees, and the chief island, form a tiny picturesque scene so pleasing, that all around the country appears more dreary by the contrast. The island of Moy, situated in the centre of the lake, consists of perhaps two acres of ground, and contains the remains of a house once a chief seat of the lairds of Mackintosh, or heads of the powerful northern clan Chattan, and which attests, from various circumstances, the opulence and consequence of this long independent dynasty. Many a terrific tale of feud and battle is related about this insular strength. Among the prevailing legends of the Celts of Badenoch, the following has obtained a traditional notoriety. It is told that in a great battle which took place between the Cummins and Mackintoshes, the former were defeated, and being unable or unwilling to renew the war, a peace was proposed and accepted. To celebrate it, the Cummins invited the Mackintoshes to a feast prepared in the castle of Moy, with all the rude sumptuousness of feudal wealth. It was the secret design, however, of the treacherous inviters, to murder their unsuspecting guests, and it was arranged that a Mackintosh should sit, under the pretence of distinction, on the right hand of every Cummin, and that at a concerted signal he was to be stabbed by his neighbour. The signal proposed was the introduction of a bull's head. Happily this base and murderous plot was made known privily by one of the Cummins to the guests; and when the signal was made, so ready and active were the Mackintoshes, that they instantly plunged their dirks into the bodies of those beside them, and so prevented this extensive scheme of assassination by a just and indiscriminate slaughter of their pretended friends.

It is surprising how little is known of some of the finest Highland lakes, even by the people of Scotland. Loch Maree, in the north-west part of the Highlands, is only known by name, or by the descriptions of at most one or two travellers. Being situated in the parish of Gairloch, in the western wilds of Ross-shire, it lies so much out of the common route of tourists, that it is perhaps thought to be unworthy of a journey across the moors and mountains. Yet it is a noble lake, extending about sixteen miles in length, by a breadth of from one to two, and emitting its redundant waters by a river, falling into a salt-water bay on the west coast, called Loch Ewe. This extensive sheet of water is studded with some fine woody islands, and is partly surrounded with the sublimest mountain scenery. In the language of Macculloch, who alone has visited it in recent times for purposes of description, "it is bounded by high mountains, and having a very varied and irregular outline, its shores present a good deal of interesting scenery, the entire lake itself being displayed from many different points, and under a great variety of aspects, so as to produce some of the finest specimens of this class of landscape in the Highlands. In point of style, it ranks rather more nearly with Loch Lomond than with any other of the southern lakes, though still very inferior. The most accessible and the finest general views may be obtained from the rocky hills that bound the exit of the river. The mountain outline, which is grand and various, presents a greater diversity of form and character than any of the Scottish lakes; but Ben Lair is always the principal—graceful, solid, and broad. The middle ground is a source of variety—splendid and wild, an intermixture of rock and wood. The winding and

wooded course of the river Ewe adds much to its loveliness. Though there is a road on each side of the lake, the circuit is both laborious and tedious. The northern margin of Loch Maree presents a great variety of close shore scenery, consisting of rocky and wooded bays and creeks, rising into noble and overhanging cliffs and mountains. In one place the remains of a fir forest, in a situation almost incredible, produce a style of landscape that might be expected in the Alps, but not among the more confined scope and lower arrangements of Scottish mountains. It was with some difficulty (continues the narrator) we explored our nocturnal way through the labyrinth of islands in the centre of this lake, as they are little raised above the water, and covered with scattered firs, and with thickets of birch, alder, and holly, while they are separated by narrow and tortuous channels. Inch Maree has been dedicated to a saint of that name; and it still continues a burial place; chosen, it is said, like all those which are found in islands, to prevent depredations from the wolves of ancient days."

THE QUEEN OF THE MEADOW.

BY MISS MITFORD.

IN a winding unfrequented road, on the south side of our Village, close to a low two-arched bridge, thrown across a stream of more beauty than consequence, stood the small irregular dwelling, and the picturesque building of Hatherford Mill. It was a pretty scene on a summer afternoon, was that old mill, with its strong lights and shadows, its low-browed cottage covered with the clustering Pyracantha, and the clear brook, which, after dashing, and foaming, and brawling, and playing off all the airs of a mountain river, while pent up in the mill-stream, was no sooner let loose, than it subsided into its natural peaceful character, and crept quietly along the valley, meandering through the green woody meadows, as tranquil a trout stream as ever Isaac Walton angled in.

Many a traveller has stayed his step to admire the old buildings of Hatherford Mill, backed by its dark orchard, especially when its accompanying figures, the jolly miller, sitting before the door, pipe in mouth, and jug in hand, like one of Teniers' boors, the mealy miller's man with his white sack over his shoulders, carefully descending the out-of-doors steps, and the miller's daughter, flitting about amongst her poultry, gave life and motion to the picture.

The scenery at the other side of the road was equally attractive, in a different style. Its principal feature was the great farm of the parish, an old manorial house, solid and venerable, with a magnificent clump of witch elms in front of the porch, a suburb of out-buildings behind, and an old-fashioned garden with its rows of espaliers, its wide flower borders, and its close filbert-walk, stretching like a cape into the waters, the strawberry beds, sloping into the very stream; so that the cows, which in sultry weather came down by twos and by threes from the opposite meadows, to cool themselves in the water, could almost crop the leaves as they stood.

In my mind, that was the pleasanter scene of the two; but such could hardly have been the general opinion, since nine out of ten passers-by never vouchsafed a glance at the great farm, but kept their eyes steadily fixed on the mill; perhaps to look at the old buildings, perhaps at the miller's young daughter.

Katy Dawson was accounted by common consent the prettiest girl in the parish. Female critics in beauty would be sure to limit the commendation, by asserting that her features were irregular, that she had not a good feature in her face, and so forth; but these remarks were always made in her absence, and no sooner did she appear, than even her critics felt the power of her exceeding loveliness. It was the Hebe look of youth and health, the sweet and joyous expression, and, above all, the unrivalled brilliancy of colouring, that made Katy's face, with all its faults, so pleasant to look upon. A complexion of the purest white, a coral lip, and a cheek like the pear, her namesake, "on the side that's next the sun," were relieved by rich curls of brown hair, of the deep yet delicate hue that one sometimes finds in the ripest and latest hazel-nut of the season. Her figure was well suited to her blossomy countenance, round, short, and child-like; add to this "a pretty foot, a merry glance, a passing pleasing tongue," and no wonder that Katy was the belle of the village.

But gay and smiling though she were, the fair maid of the mill was little accessible to wooers. Her mother had long been dead, and her father, who held her as the very apple of his eye, kept her carefully away from the rustic junketings, at which rural flirtations are usually begun. Accordingly, our village beauty had reached the age of eighteen, without a lover. She had indeed had two offers; one from a dashing horse-dealer, who, having seen her for five minutes one day, when her father called her to admire a nag that he was cheapening, proposed for her that very night as they were chaffering about the price, and took the refusal in such dudgeon, that he would have left the house utterly inconsolable, had he not contrived to comfort himself by cheating the offending papa, twice as much as he intended, in his horse bargain. The other proffer was from a stayed, thick, sober, silent, middle-aged personage, who united the offices of schoolmaster and land-measurer, an old crony of the good miller's, in whose little parlour he had smoked his pipe regularly every Saturday evening for the last thirty years, and who called him still from habit, "Young Sam Robinson." He, one evening

as they sat together smoking outside the door, broke his accustomed silence with a formal demand of his comrade's permission to present himself as a suitor to Miss Katy; which permission being, as soon as her father could speak for astonishment, civilly refused, Master Samuel Robinson addressed himself to his pipe again, with his wonted phlegm, played a manful part in emptying the ale jug, and discussing the Welsh rabbit, reappeared as usual, on the following Saturday, and to judge from his whole demeanour, seemed to have entirely forgotten his unlucky proposal.

Soon after the rejection of this most philosophical of all discarded swains, an important change took place in the neighbourhood, in the shape of a new occupant of the great farm. The quiet respectable old couple who had resided there for half a century, had erected the mossy sun-dial, and planted the great mulberry tree, having determined to retire from business, were succeeded by a new tenant from a distant country, the youngest son of a gentleman brought up to agricultural pursuits, whose spirit and activity, his boldness in stocking and cropping, and his scientific management of manures and machinery, formed the strongest possible contrast with the old-world practices of his predecessors. All the village was full of admiration of the intelligent young farmer Edward Grey; who being unmarried, and of a kindly and sociable disposition, soon became familiar with high and low, and was nowhere a greater favourite than with his opposite neighbour, our good miller.

Katy's first feeling towards her new acquaintance was an awe, altogether different from her usual shamedness; a genuine fear of the quickness and talent which broke out, not merely in his conversation, but in every line of his acute and lively countenance. There was occasionally a sudden laughing light in his hazel eye, and a very arch and momentary smile, now seen, and now gone, to which, becoming as most people thought them, she had a particular aversion. In short, she paid the young farmer, for so he persisted in being called, the compliment of running away, as soon as he came in sight, for three calendar months. At the end of that time, appearances mended. First she began to loiter at the door; then she staid in the room; then she listened; then she smiled; then she laughed outright; then she ventured to look up; then she began to talk in her turn; and before another month had passed, would prattle to Edward Grey as fearlessly and freely as to her own father.

On his side, it was clear that the young farmer, with all his elegance and refinement, his education and intelligence, liked nothing better than this simple village lass. He passed over the little humours, proper to her as a beauty and a spoiled child, with the kindness of an indulgent brother; was amused with her artlessness and delighted with her gaiety. Gradually he began to find his own fireside lonely, and the parties of the neighbourhood boisterous; the little parlour of the miller formed just the happy medium, quietness without solitude, and society without dissipation—and thither he resorted accordingly. His spaniel, Ranger, taking possession of the middle of the hearth-rug, just as comfortably as if in his master's own demesnes, and Katy's large tabby cat, a dog-hater by profession, not merely submitting to the usurpation, but even ceasing to erect her bristles on his approach.

So the world waned for three months more. One or two little miffs had indeed occurred between the parties; once, for instance, at a fair held in the next town on the first of May: Katy having been frightened at the lions and tigers painted outside a show, had nevertheless been half-led, half-forced into the booth to look at the real living monster by the ungallant beau. This was a sad offence. But unluckily our village damsel had been so much entertained by some monkeys and parrots on her first entrance, that she quite forgot to be frightened, and afterwards, when confronted with the royal brutes, had taken so great a fancy to a beautiful panther, as to wish to have him for a pet; so that this quarrel passed away almost as soon as it began. The second was about the colour of a ribband, an election ribband. Katy having been much caught by the graceful person and gracious manners of a county candidate who called to request her father's vote, had taken upon herself to canvass their opposite neighbour, and was exceedingly astonished to find her request refused, on no better plea than a difference from her favourite in political opinion, and a previous promise to his opponent. The little beauty, astonished at her want of influence, and rendered zealous by opposition, began to look grave, and parties would certainly have run high at Hatherford, had not her candidate put a stop to the dispute by declining to come to the poll; so that that quarrel was perforce pretermitted. At last a real and serious anxiety overclouded Katy's innocent happiness; and, as it often happens in this world of contradictions, the grievance took the form of a gratified wish.

Of all her relations, her cousin Sophy Maynard had long been her favourite. She was an intelligent unaffected young woman, a few years older than herself, the daughter of a London tradesman, excellently brought up, with a great deal of information and taste, and a total absence of airs and finery. In person she might almost be called plain; but there was such natural gentility about her, her manners were so pleasing, and her conversation so attractive, that few people, after passing an evening in her society, remembered her want of beauty. She was exceedingly fond of the country and of her pretty cousin, who, on

her part, looked up to her with much of the respectful fondness of a younger sister, and had thought to herself a hundred times, when most pleased with their new neighbour, "how I wish my cousin Sophy could see Edward Grey;" and now that cousin Sophy had seen Edward Grey, poor Katy would have given all that she possessed in the world, if they had never met. They were heartily delighted with each other, and proclaimed openly their mutual good opinion. Sophy praised Mr Grey's vivacity; Edward professed himself enchanted with Miss Maynard's voice. Each was astonished to find in the other a cultivation unusual in that walk of life. They talked, and laughed, and sang together, and seemed so happy, that Katy, without knowing why, became quite miserable, flew from Edward, avoided Sophy, shrank from her kind father, and found no rest or comfort, except when she could creep alone to some solitary place, and give vent to her vexation in tears. Poor Katy! she could not tell what ailed her; but she was quite sure she was wretched, and then she cried again.

In the meanwhile, the intimacy between the new friends became closer and closer. There was an air of intelligence between them that might have puzzled wiser heads than that of our simple miller-maiden. A secret—Could it be a love secret? And the influence of the gentleman was so open and avowed, that Sophy, when on the point of departure, consented to prolong her visit to Hatherford, at his request, although she had previously resisted Katy's solicitations and the hospitable urgency of her father.

Affairs were in this posture, when one fine evening, towards the end of June, the cousins sallied forth for a walk, and were suddenly joined by Edward Grey when at such a distance from the house as to prevent the possibility of Katy's stealing back thither, as had been her usual habit on such occasions. The path they chose led through long narrow meadows, sloping down on either side to the winding stream, enclosed by high hedges, and seemingly shut out from the world.

A pleasant walk it was, through those newly-mown meadows, just cleared of the hay, with a bright rivulet meandering through banks so variously beautiful; now fringed by rushes and sedges; now bordered by little thickets of hawthorn and woodbine, and the briar-rose; now overhung by a pollard ash, or a silver-barked beech, or a lime-tree in full blossom. Now a smooth turf slope, green to the eye, and soft to the foot; and now again a rich embroidery of the golden flag, the purple willow-herb, the blue forget-me-not, and "a thousand fresh-water flowers of several colours," making the bank as gay as a garden.

It was impossible not to pause in this lovely spot; and Sophy, who had been collecting a bright bunch of pink blossoms, the ragged-robin, the wild rose, the crane's bill, and the fox-glove, or to use the prettier Irish name of that superb plant, the fairy-cap, appealed to Katy to "read a lecture of her country art," and show "what every flower, as country people hold, did signify"—a talent for which the young maid of the mill was as celebrated as Bellario. But poor Katy, who, declining Edward's offered arm, had loitered a little behind, gathering a long wreath of the woodbine, and the briony, and the wild vetch, was, or pretended to be, deeply engaged in twisting the garland round her straw bonnet, and answered not a word. She tied on her bonnet, however, and stood by listening, whilst the other two continued to talk of the symbolic meaning of flowers, quoting the well-known lines from the *Winter's Tale*, and the almost equally charming passage from *Philaster*.

At length Edward, who, during the conversation, had been gathering all that he could collect of the tall almond-scented tufts of the elegant meadow sweet, whose crested blossoms arrange themselves in a plumage so richly delicate, said, holding up his nosegay, "I do not know what mystical interpretation may be attached to this plant in Katy's 'country art,' but it is my favourite amongst flowers; and if I were inclined to follow the Eastern fashion of courtship, and make love by a nosegay, I should certainly send it to plead my cause. And it shall be so," he added, after a short pause, his bright and sudden smile illumining his whole countenance; "the botanical name signifies, the Queen of the Meadow; and wherever I offer this tribute, wherever I place this tuft, the homage of my heart, the proffer of my hand, shall go also. Oh, that the offering might find favour with my queen!" Katy heard no more. She turned away to a little bay formed by the rivulet, where a bed of pebbles, overhung by a grassy bank, afforded a commodious seat, and there she sat her down, trembling, cold, and wretched; understanding, for the first time, her own feelings, and wondering if any body in all the world had ever been so unhappy before.

There she sat, with the tears rolling down her cheeks, unconsciously making "rings of rushes that grew thereby," and Edward's dog Ranger, who had been watching a shoal of minnows at play in the shallow water, and every now and then inserting his huge paw into the stream, as if trying to catch one, came to her, and laid his rough head and his long curling brown ears into her lap, and looked at her "with eyes whose human meaning did not need the aid of speech"—eyes full of pity and of love; for Ranger, in common with all the four-footed world, loved Katy dearly; and now he looked up in her face, and licked her cold hand. Oh! kinder and faithfuller than your master, thought poor Katy, as with a fresh gush of tears she laid her sweet face on the dog's head, and sat in that position, as it seemed to her, for ages, whilst her

companions were hooking and landing some white water-lilies.

At last they approached, and she arose hastily, and tremblingly, and walked on, anxious to escape observation. "Your garland is loose, Katy," said Edward, lifting his hand to her bonnet: "Come and see how nicely I have fastened it! No clearer mirror than the dark smooth basin of water under those hazels!—come!" He put her hand under his arm, and led her thither; and there, when mechanically she cast her eyes on the stream, she saw the rich tuft of meadow-sweet, the identical Queen of the Meadow, waving like a plume, over her own straw bonnet; felt herself caught in Edward's arms, for, between surprise and joy, she had well nigh fallen; and when, with instinctive modesty, she escaped from his embrace, and took refuge with her cousin, the first sound that she heard was Sophy's affectionate whisper, "I knew it all the time, Katy! every body knew it but you! and the wedding must be next week, for I have promised Edward to stay and be bride's-maid;" and the very next week they were married.—*Our Village.*

DISCOVERY OF THE PACIFIC OCEAN.

It will be remembered by the readers of the *History of America*, that the latter days of Columbus, the discoverer of that continent and its islands, were embittered by the turbulence of his fellow-adventurers, who succeeded him in his command, and deprived him of the lustre belonging to his valuable services. Among those ambitious and discontented, but brave Spaniards, few were an equal match to Vasco Nunez de Balboa, either for the command which he obtained over his associates, or for his daring intrepidity in facing danger. We learn from an exceedingly agreeable volume, entitled "*The Voyages of the Companions of Columbus*," published in the *Family Library*, that this man was one of the most enterprising of those commanders appointed by Spain in taking charge of the colony at Darien. He was never tired of levying war against the caciques, or petty native princes, and it was on one of his expeditions of this nature, when extorting gold from one of the simple inhabitants, that he received intelligence of the existence of the great Pacific Ocean at no very great distance on the opposite side of the country. In the government of the colony, Vasco Nunez does not appear to have been much actuated by principles of moderation or justice. By his audacious conduct he at length roused the indignation of the Spanish sovereign, and was condemned in certain damages. Informed of this storm, which had arisen in consequence of the complaints laid against him, and that he would be immediately summoned to the court of Spain, to answer the criminal charge advanced against him, he at once resolved on the means to be adopted for his protection.

Vasco Nunez (says the author) was at first stunned by this intelligence, which seemed at one blow to annihilate all his hopes and fortunes. He was a man, however, of prompt decision and intrepid spirit. The information received from Spain was private and informal; no order had yet arrived from the king; he was still master of his actions, and had control over the colony. One brilliant achievement might atone for all the past, and fix him in the favour of the monarch. Such an achievement was within his reach—the discovery of the southern sea. It is true, a thousand soldiers had been required for the expedition; but were he to wait for their arrival from Spain, his day of grace would be past. It was a desperate thing to undertake the task with the handful of men at his command, but the circumstances of the case were desperate. Fame, fortune, life itself, depended upon the successful and the prompt execution of the enterprise. To linger was to be lost.

Vasco Nunez looked round upon the crew of daring and reckless adventurers that formed the colony, and chose one hundred and ninety of the most resolute, vigorous, and devoted to his person. These he armed with swords, targets, cross-bows, and arquebuses. He did not conceal from them the danger of the enterprise into which he was about to lead them; but the spirit of these Spanish adventurers was always roused by the idea of perilous and extravagant exploit. To aid his slender forces, he took with him a number of bloodhounds, which had been found to be terrific allies in Indian warfare.

The Spanish writers make particular mention of one of those animals, named Leonico, which was a constant companion, and, as it were, body-guard of Vasco Nunez, and describe him as minutely as they would a favourite warrior. He was of a middle size, but immensely strong: of a dull-yellow or reddish colour, with a black muzzle, and his body was scarred all over with wounds received in innumerable battles with the Indians. Vasco Nunez always took him on his expeditions, and sometimes lent him to others, receiving for his services the same share of booty allotted to an armed man. In this way he gained by him in the course of his campaigns upwards of a thousand crowns. The Indians, it is said, had conceived such terror of this animal, that the very sight of him was sufficient to put a host of them to flight.

In addition to these forces, Vasco Nunez took with him a number of the Indians of Darien, whom he had won to him by kindness, and whose services were important, from their knowledge of the wilderness, and of the habits and resources of savage life. Such was the motley armament that set forth from the little colony of Darien, under the guidance of a daring, if not

desperate commander, in quest of the great Pacific Ocean.

It was on the first of September that Vasco Nunez embarked with his followers in a brigantine and nine large canoes or pirogues, followed by the cheers and good wishes of those who remained at the settlement. Standing to the north-westward, he arrived without accident at Coyba, the dominion of the cacique Careta, whose daughter he had received as a pledge of amity. That Indian beauty had acquired a great influence over Vasco Nunez, and appears to have cemented his friendship with her father and her people. He was received by the cacique with open arms, and furnished with guides and warriors to aid him in his enterprises.

Vasco Nunez left about half of his men at Coyba to guard the brigantine and canoes, while he should penetrate the wilderness with the residue. The importance of his present expedition, not merely as affecting his own fortunes, but as it were unfolding a mighty secret of nature, seems to have impressed itself upon his spirit, and to have given correspondent solemnity to his conduct. Before setting out upon his march, he caused mass to be performed, and offered up prayers to God for the success of his perilous undertaking.

It was on the sixth of September that he struck off for the mountains. The march was difficult and toilsome in the extreme. The Spaniards, encumbered with the weight of their armour and weapons, and oppressed by the heat of a tropical climate, were obliged to climb rocky precipices, and to struggle through close and tangled forests. Their Indian allies aided them by carrying their ammunition and provisions, and by guiding them to the most practicable paths.

On the eighth of September they arrived at the village of Ponca, the ancient enemy of Careta. The village was lifeless and abandoned; the cacique and his people had fled to the fastnesses of the mountains. The Spaniards remained here several days to recruit the health of some of their number who had fallen ill. It was necessary also to procure guides acquainted with the mountain wilderness they were approaching. The retreat of Ponca was at length discovered, and he was prevailed upon, though reluctantly, to come to Vasco Nunez. The latter had a peculiar facility in winning the confidence and friendship of the natives. The cacique was soon so captivated by his kindness, that he revealed to him in secret all he knew of the natural riches of the country. He assured him of the truth of what had been told him about a great pechry or sea beyond the mountains, and gave him several ornaments ingeniously wrought of fine gold, which had been brought from the countries upon its borders. He told him, moreover, that when he had attained the summit of a lofty ridge, to which he pointed, and which seemed to rise up to the skies, he would behold that sea spread out far below him.

Animated by the accounts, Vasco Nunez procured fresh guides from the cacique, and prepared to ascend the mountains. Numbers of his men having fallen ill from fatigue and the heat of the climate, he ordered them to return slowly to Coyba, taking with him none but such as were in robust and vigorous health. On the 20th of September, he again set forward through a broken rocky country, covered with a matted forest, and intersected by deep and turbulent streams, many of which it was necessary to cross upon rafts. So toilsome was the journey, that in four days they did not advance above ten leagues, and in the meantime they suffered excessively from hunger. At the end of this time they arrived at the province of a warlike cacique, named Quaraqua, who was at war with Ponca.

Hearing that a band of strangers were entering his territories, guided by subjects of his inveterate foe, the cacique took the field with a great number of warriors, some armed with bows and arrows, others with long spears, or with double-handed maces of palm-wood, almost as heavy and hard as iron. Seeing the inconsiderable number of the Spaniards, they set upon them with furious yells, thinking to overcome them in an instant. The first discharge of fire-arms, however, struck them with dismay. They thought they were contending with demons who vomited forth thunder and lightning, especially when they saw their companions fall bleeding and dead beside them, without receiving any apparent blow. They took to headlong flight, and were hotly pursued by the Spaniards and their bloodhounds. Some were transfixed with lances, others hewn down with swords, and many were torn to pieces by the dogs, so that Quaraqua and six hundred of his warriors were left dead upon the field. After this sanguinary triumph, the Spaniards marched to the village of Quaraqua, where they found considerable booty in gold and jewels. Of this Vasco Nunez reserved one-fifth for the crown, and shared the rest liberally among his followers. The village was at the foot of the last mountain that remained for them to climb; several of the Spaniards, however, were so disabled by the wounds they had received in battle, or so exhausted by the fatigue and hunger they had endured, that they were unable to proceed. They were obliged therefore reluctantly to remain in the village, within sight of the mountain-top that commanded the long-sought prospect. Vasco Nunez selected fresh guides from among his prisoners, who are natives of the province, and sent back the subjects of Ponca. Of the band of Spaniards who had set out with him in this enterprise, 67 alone remained in sufficient health and spirits for this last effort. These he ordered to retire early to repose, that they might

be ready to set off at the cool and fresh hour of day-break, so as to reach the summit of the mountain before the noon-tide heat.

The day had scarce dawned, when Vasco Nunez and his followers set forth from the Indian village, and began to climb the height. It was a severe and rugged toil for men so wayworn; but they were filled with new ardour at the idea of the triumphant scene that was so soon to repay them for all their hardships. About ten o'clock in the morning they emerged from the thick forests through which they had hitherto struggled, and arrived at a lofty and airy region of the mountain. The bald summit alone remained to be ascended; and their guides pointed to a moderate eminence, from which they said the southern sea was visible.

Upon this, Vasco Nunez commanded his followers to halt, and that no man should stir from his place. Then with a palpitating heart he ascended alone the bare mountain-top. On reaching the summit, the long desired prospect burst upon his view. It was as if a new world were unfolded to him, separated from all hitherto known by this mighty barrier of mountains. Below him extended a vast chaos of rock and forest, and green savannahs and wandering streams, while at a distance the waters of the promised ocean glittered in the morning sun.

At this glorious prospect, Vasco Nunez sank upon his knees, and poured out thanks to God for being the first European to whom it was given to make that great discovery. He then called his people to ascend: "Behold, my friends," said he, "that glorious sight which we have so much desired. Let us give thanks to God that he has granted us this great honour and advantage. Let us pray to him to guide and aid us to conquer the sea and land which we have discovered, and which Christian has never entered to preach the holy doctrine of the Evangelists. As to yourselves, be as you have hitherto been, faithful and true to me, and by the favour of Christ you will become the richest Spaniards that have ever come to the Indies; you will render the greatest services to your king that ever vassal rendered to his lord; and you will have the eternal glory and advantage of all that is discovered, conquered, and converted to our holy Catholic faith."

The Spaniards answered this speech by embracing Vasco Nunez, and promising to follow him to death. Among them was a priest, named Andres de Vara, who lifted up his voice and chaunted *Te Deum laudamus*—the usual anthem of Spanish discoverers. The rest, kneeling down, joined in the strain with pious enthusiasm and tears of joy; and never did a more sincere oblation rise to the Deity from a sanctified altar than from that wild mountain summit. It was indeed one of the most sublime discoveries that had yet been made in the new world, and must have opened a boundless field of conjecture to the wondering Spaniards. The imagination delights to picture forth the splendid confusion of their thoughts. Was this the great Indian Ocean, studded with precious islands, abounding in gold, in gems, and spices, and bordered by the gorgeous cities and wealthy marts of the east? or was it some lonely sea locked up in the embraces of savage uncultivated continents, and never traversed by a bark, excepting the light pirogue of the savage? The latter could hardly be the case, for the natives had told the Spaniards of golden realms, and populous and powerful and luxurious nations upon its shores. Perhaps it might be bordered by various people, civilized in fact, though differing from Europe in their civilization; who might have peculiar laws and customs, and arts and sciences; who might form, as it were, a world of their own, inter-communing by this mighty sea, and carrying on commerce between their own islands and continents, but who might exist in total ignorance and independence of the other hemisphere.

Such may naturally have been the ideas suggested by the sight of this unknown ocean. It was the prevalent belief of the Spaniards, however, that they were the first Christians who had made the discovery. Vasco Nunez, therefore, called upon all present to witness that he took possession of that sea, its islands, and surrounding lands, in the name of the sovereigns of Castile; and the notary of the expedition made a testimonial of the same, to which all present, to the number of 67 men, signed their names. He then caused a fair and tall tree to be cut down, and wrought into a cross, which was elevated on the spot from whence he had first beheld the sea. A mound of stones was likewise piled up to serve as a monument, and the names of the Castilian sovereigns were carved on the neighbouring trees. The Indians beheld all these ceremonials and rejoicings in silent wonder, and, while they aided to erect the cross and pile up the mound of stones, marvelled exceedingly at the meaning of these monuments, little thinking that they marked the subjugation of their land.

The memorable event here recorded took place on the 26th of September 1513, so that the Spaniards had spent 20 days in performing the journey from the province of Creta to the summit of the mountain, a distance which at present, it is said, does not require more than six days' travel. Indeed, the isthmus in this neighbourhood is not more than eighteen leagues in breadth, in its widest part, and in some places only seven; but it consists of a ridge of extremely high and rugged mountains. When the discoverers traversed it, they had no route but the Indian paths, and often had to force their way amidst all kinds of obstacles, both from the savage country and its savage inhabitants. In fact, the details of this nar-

ative sufficiently account for the slowness of their progress, and present an array of difficulties and perils, which, as has been well observed, none but those "men of iron" could have subdued and overcome.

HINDOOISM.

In a pleasingly-written volume, entitled "Indian Recollections, by J. Strathan," intended, it would appear, to advance the cause of the Indian missions for the propagation of Christianity, we are presented with the following lucid view of Hindooism:—"The Hindoo religion is so complex in its nature, that it is impossible fully to detail its various branches, being founded on superstition, all its parts are moulded on an artificial system, difficult to unravel or explain. The whole family is divided into four branches or tribes, called CASTES, and denominated Brahmins, Kytetra, Bhysya, and Soodra. The rank, occupation, and duties of these several castes, are fully explained in their Vedahs, or holy books. The Brahmins are the priests; they are required to be virtuous, learned, just, peaceable, and self-denying. If these were the distinguishing traits of their order, the very reverse are the features of their character now. The Kytetra is the military caste; the Vedahs require of them a thirst for glory; to die rather than retreat; generosity and princely conduct to captives. Bhysya form the agricultural part of the community; their duties are briefly defined as cultivators and traffickers. The fourth, or Soodra caste, consists of labourers, who are enjoined to serve with patience and fidelity; the former, I believe, they generally do, but as for the latter, it is only when constrained by fear of punishment or loss of pay. The two middle castes have almost become extinct, or rather amalgamated with the former and latter. Thus, it may almost be said that the whole Hindoo nation is now composed of Brahmins, or Soodras, both of which are divided into a great many degrees, or sub-castes: so that there are many orders of Brahmins as well as Soodras. Of the latter the Koit is the highest, and the Hurry the lowest, which caste embraces shoe-makers, mat-makers, bird-catchers, tanners, skimmers, snake-catchers, and many others. By this division of caste, no possible means exist for any person to rise in the scale of society; all motives to exertion or mental improvement are cut off; no actions, however noble, no discoveries, however important to society, would ensure honour to a person of low caste; and those of high caste lose no honour or reputation by their ignorance and vice. Whatever be the mental abilities of a Hindoo, if born a Soodra, a Soodra he must remain; if the father be a snake-catcher, all his sons must be snake-catchers too; and the influence of caste follows him through all the ramifications of life. Persons of different castes or occupations cannot eat, drink, or smoke together; neither can they intermarry, nor meddle with each other's employment. If a Hindoo loses caste, which is the case if he breaks through any of the foregoing rules, the most distressing consequences ensue: no one will eat with him, or suffer him to come near his dwelling, or marry his children; his own wife and family disown him; looked upon as an outcast of society, he is deprived of all privileges, or means of comfort, as long as he lives; and however respectable he may have been before, the meanest caste consider him a vagabond, and will not associate with him. It is caste that renders so many servants necessary to do the work which one or two might easily accomplish. They are born to one particular department of service, and no other can they perform without losing caste. Thus, the man who fetches water cannot wait at table, nor the man who cooks the dinner serve it up; neither will the person who attends the table sweep the room afterwards—and so on through all the different pursuits of life. A native embracing Christianity loses caste by partaking of the Lord's Supper; it requires, therefore, great fortitude of mind to make a profession of faith in the gospel. There are many who have no caste, having been excommunicated because of some breach of the ceremonial laws of their religion, either by themselves or their forefathers; these are all termed Pariahs, and dare not touch the person, garments, food, utensils, or dwelling of a Hindoo of caste, as contamination follows. The Brahmins are a very lordly, domineering race, and exact the most severe homage of the Soodras. They themselves are under great restrictions, as well as the Soodras, particularly in the article of food, being prohibited from eating any thing that has had life, except fish. This, I consider, arises from their belief in the doctrine of transmigration; and as they believe that although the spirits of their ancestors may have entered the bodies of all beasts, birds, reptiles, and insects, yet they do not enter into another element, so that they may eat fish with impunity. Their principal diet is rice; this, with spices, milk, and ghee, is their principal repast, although they may partake of the flesh of such animals as are offered in sacrifice to the gods, the laws of men permitting this.

The Brahmins, though all eligible to the priesthood, yet do not all follow it. Some enter the military service of the Hon. Company, and others become clerks and copyists; but none are permitted to engage in menial employments, and in whatever state they are found, the same honour is paid by their associates, though perhaps not to that degree as if in priestly office. So great is the pride of the Brahmins, that they claim precedence of kings, and the noblest rajah will partake of food booked or presented by a Brahmin, whilst the meanest Brahmin will not taste that which

has been touched by the mightiest monarch, if not one of their own tribe. Many Brahmins are totally ignorant of their own Shasters, and these are always the most intolerant exactors of homage from the Soodras. Those amongst them who are at all learned are the most conceited pedants that can be possibly imagined. All pretend to a knowledge of astrology, and will calculate lucky days in which the business of life may be transacted. A Soodra always consults his teacher before he buys a cow, goes a journey, or engages in any concern, however trifling, and the Brahmins never act gratuitously. The whole system is founded in priestcraft.

The sacred writings of the Hindoos are of two kinds—the Vedas and Shasters. The former may be termed their scriptures, the latter expositions of them. The Vedas are divided into four books, all written in the Sanscrit language. The first book is called Rug Veda, which signifies the Science of Divination, concerning which it principally treats. The second is distinguished by the title of Sheeham, which signifies Piety or Devotion, and this book treats of religious and moral duties. The third is the Judga Veda, which, as the word implies, includes the whole science of religious rites and ceremonies. The fourth is denominated Obater Bah, or the knowledge of the Good Being, and accordingly this book comprehends the whole essence of theology and metaphysical philosophy. The Vedas, as also the Shasters or Commentaries, pretend to great antiquity; so much so, that many Europeans have been strangely staggered in their belief of the Mosaic chronology, by reading them. But it only requires a little consideration and research to discover a vein of imposition running through the whole details. The idea which their Shasters give of God is—that there is one Supreme Being, whom they style Bhogabon or Esher, sometimes Khodah; proceeding from him are three powers or deities, namely, Brahmha, the creator of all; Vishnu, the preserver of all; and Seeb, or Sheva, the destroyer of all. Now, whilst the latter is worshipped by all, the former has scarcely any attention paid to his temples; and Vishnu, the preserver, has few votaries, compared with the destroyer, Seeb. Subordinate to these are three hundred and thirty millions of inferior gods and goddesses, each representing some particular virtue or vice. They even go so far as to deify the waters of the Ganges, into which the whole population crowd morning and evening to bathe; and the water of this sacred stream is carried to all parts of India, and to swear by in a court of justice. At Allahabad, where the streams of the Ganges and Jumna unite, the country for many miles round is considered sacred ground; and so great is the number of pilgrims who resort thither for bathing, that the vizier has received in one year half a lac of rupees for permission to enjoy the benefit of immersion in the sacred flood. Oftentimes have I witnessed children hurrying their parents to the river side, fearful lest they should die before they reached its banks. Nothing can be more distressing to the feelings than to behold these poor expiring creatures, some calling upon Rham, some upon one of their false gods, others upon another, with their bodies half in the water and half out, the rising tide soon to overwhelm them. Many are laid where the tide cannot reach them, and their case is more pitiable still. Beneath a burning sun, they are left without food, and many of them, who would no doubt recover from their diseases if proper attention were paid to them, are literally starved to death, or devoured by jackals at night. The whole system of Hindooism is the most licentious and impure it is possible to conceive—so much so, that many of their rich men, who are very depraved, cannot but admit that it is too gross to be fully supported. The writings of the Hindoos, every class of them, even their works on ethics, are full of abominable allusions and descriptions, so that they are to-day what they were ages ago, a people unrivalled for impurity. The priests and the religious mendicants, under the dreadful profligacy which prevails, are the very ringleaders in crime. How noble, it may be added, must be the enterprise of endeavouring to reclaim the populous empire of India from these heathenish and vicious practices, and establishing in their stead the pure principles and practice of our own beneficent faith; but until some civil enactment, and a large introduction of British emigrants, have the effect of demolishing all ideas of caste, it is hopeless to expect any change worth mentioning in the debased moral condition of the Hindoos.

HEARING THE EVIDENCE.

Robert Burns dined in Edinburgh with a large party, in company with the late Lord Swinton and the Honourable Henry Erskine. Honest Lord Swinton had become extremely deaf. From time to time he observed the company convulsed with laughter; but his deafness prevented him enjoying the exquisite humour of Mr Erskine. That, however, was of little consequence: he inquired at his next neighbour, "Is that my friend Harry?" Being answered in the affirmative, he burst out into as hearty a laugh as the best of them, and in this manner partook in the general hilarity the whole evening. Burns next day mentioning the circumstance to a lady of his acquaintance, she expressed her astonishment that a man who could act so absurdly should sit as a judge on the lives and fortunes of his fellow-subjects. "My dear madam," answered Burns, "you wrong the honest man; he acts exactly as a good judge ought; he does not decide before he has heard the evidence."

Column for Boys.

The youthful Veomany are in the field—
Their tents are pitched, and every heart beats high
To join the friendly strife:—their stoutest forts
Are slender wickets;—all their entrenchments,
A popping and a bowling-crease; their weapons,
Bats;—their ammunition, a brace of balls,
In leathern and tight-fitting jerkins clad.

MY DEAR LITTLE BOYS,

I AM almost afraid you will be beginning to think I have forgot my promise, in not devoting a column oftener to matters connected with your sports and amusements; but the truth is, as I can assure you, I have been kept very busy writing all manner of things, not a few of which, as you may have perceived, have been put into the Journal for the perusal of no one but yourselves. I daresay you will have found a number of my essays very dull and tiresome, and not the least funny; but then you know there are many good folks who like that kind of reading, and would not for the world that all the articles were light and humorous; and I could wager—though I hate betting, for it is an exceedingly bad practice—that in time you will also say you like to read a grave piece now and then, and will perhaps go the length of searching out some old neglected numbers of the Journal, for the express purpose of reading those papers you now consider so very dry and valueless. When I was a little chap like yourselves, and ran about with a cap and a jacket, I had the very same notions of reading as you have, and could not bear the sight of a book which had no stories in it. When I fell in with a volume of old magazines, I did nothing but turn over the leaves to pick out the tales, if there were any, and you may be sure, when I did light upon a story, I was not long in going through it from beginning to end. I often in my own mind compare the condition of boys in my period of youth, with that of the boys of the present day, and I always think how much better off you are. In my time, boys were paid very little attention to, and had a sad life of it. They were generally driven to school by their fathers and mothers frequently with blows, and nearly all that they learned was thrashed into them by the schoolmasters. Many a time have I beheld little boys stripped half naked, laid across a table, and lashed over the back in the most frightful manner, all for the most trifling inaccuracy in their lesson, or what was worse, for the fault of another; and almost every man in the present day can tell how his hands used to be blistered at school by the dreadful strokes of hardened pieces of leather, administered without regard to principles of justice. The boys in these times had in fact no sort of comfort in their schools, and they had nobody to take their part when out of them. No one ever thought of writing amusing little books for them, excepting perhaps good old Mr Newbury, at the corner of St Paul's Church Yard, who got up the ADVENTURES OF TOMMY TRIP, and the HISTORY OF KING PIPPIN, and a few more delightful books of that class, in a small size, covering them with patches of gilding or Dutch metal, and selling them to boys for sixpence a-piece. Bpt, you know, boys soon get through these, and then there was not much else for them to read but fairy tales, which are all nonsense; so they spent their time frequently in very mischievous pursuits. Their case was very sad, indeed, as you may well suppose. Now, just consider how well you are off, in comparison with these exceedingly ill-used boys. All your school-books are improved and greatly simplified, and your masters, even those who belong to the old thrashing times, are generally very attentive and kind in giving you instruction. And then such lots of story-books you've got for your entertainment at leisure hours. Very distinguished authors have condescended to write historical tales for your special use, every one of which is as nice reading as BEAUTY AND THE BEAST, or VALENTINE AND ORSON, with the advantage of being true, and of showing you how this great nation, of which you have the good fortune to be members, arose from a barbarous state to be the most powerful and opulent kingdom in the whole world. And then; have you not a whole series of tales, amounting, I believe, to some dozens in number, written by that singularly good lady, Miss Edgeworth, all about the rising of poor boys into notice through their activity and good behaviour? I am sure you feel thankful to this ingenious authoress for the many happy hours you have spent in reading her stories, especially that one called LAZY LAWRENCE, which shows how a very humble but clever little boy worked for so many pence every day, to raise as much money as would pay the rent of his grandmother's cottage, and to save her from selling her old horse Blackberry, which was her chief means of support; and how he put the pence every night into a broken flowerpot in the stable, placing it in the manger to show the poor animal what was doing for his benefit; and how the money was stolen by a very naughty boy called Lazy Lawrence, who had associated with bad companions; and how the theft was detected, as thefts always are, sooner or later; and how vice was punished and virtue rewarded. You cannot but remember this excellent story; and I am equally certain you will recollect the tale called LAME JERVIS, which is the story of a boy in the tin mines of Cornwall, who, by doing his master a great service in discovering to him a valuable vein of metal when a plan had been laid to conceal it, was promoted in his service, and, being given a good education, became, from one thing to another, a gentleman of property. But, above all, you will certainly remember the excellent tale entitled To-Morrow, which discloses the history of a young man, a shop-

keeper in London, who went all to wreck and ruin several times over, entirely from a bad habit he had of putting off the doing of every thing till to-morrow. You will recollect how, when driven to America in search of employment, he completely lost the favour of a merchant by being half an hour behind in coming to dinner, all because he had spent his time foolishly in going to hear a frog concert. You will remember, also, how vexed you were for his excellent wife Lucy, who did all in her power to remedy the errors he committed, and who, as in the case of many unfortunate women who have chanced to get bad husbands, supported the family by her ability and diligence in sewing. I do not doubt but many of you have thought that when you grew up and married, you would be glad if you could get a wife as good-tempered and as clever as Lucy; and who knows but what you may, besides arriving at great eminence in your various professions, provided you but conduct yourselves with scrupulous honesty, as well as the most vigilant industry, never putting off your time in frivolous pursuits when you have any labour or duty to perform, and on no account leaving lessons to be learned or work done to-morrow. The desire to furnish you with subjects of agreeable reading, is, however, not confined to tales of this nature, but extends itself over every department of literature and science, and stoops to illustrate the most trifling sports in which you may innocently spend your unoccupied hours. You therefore see how much attention is paid to boys of the present day, not only in furnishing instruction, but also mere amusement, in comparison with what was done in former times. Of books of pastimes for the use of persons of your age, none equals in value the Boy's Own Book, from which I have already taken some extracts, and out of which I am now going to present you with a description of that capital out-of-door sport,

THE GAME OF CRICKET.

This truly English pastime, although long a favourite with the people of this country, never reached to a greater degree of popularity than it possesses at the present time. It is a favourite with the peer and the peasant—the member of the Society of Arts and the schoolboy. Royal as has before stood bat in hand at the popping-crease, surrounded by those youthful buds of nobility of which our nation has since been proud; and, strange though it may seem, yet it is no less strange than true—young matrons have played matches of cricket against maidens, without impeachment to their usual reputation, and having husbands, brothers, and sweethearts, for their spectators. In many countries, cricket is the universal pastime of the people; in others, it is rarely played, and in many scarcely mentioned. The man of Devon, who deems all sports inferior to wrestling, and the inhabitant of Somerset, who deems upon the manly game of back-sword, seldom bestow a thought upon cricket; it is, nevertheless, esteemed and enjoyed by the people of other counties, especially those about the metropolis, as a sport paramount, and practised in such degraded manner as to exclude all other manly field recreations of a similar nature.

Cricket is usually played by eleven persons on each side, though a less number is sufficient. Two umpires are to be appointed, in order to settle all disputes that may arise; they are to take their stations at each wicket, and should be well acquainted with the laws of the game. The umpire at the striker's wicket should be rather behind it, so as not to be in the way of the players; and the umpire at the bowler's wicket directly behind it, to see that the striker does not strike the ball with his leg.

BATS, BALLS, WICKETS, &c.

The bat should not be higher than twenty-one inches in the pod, and four inches and a quarter in the widest part; this is the size for men; boys must of course have bats in proportion to their size and strength.

The ball for the use of men should weigh about five ounces; for youth, however, it should be lighter. Full-sized wickets are three stumps, which are sufficiently long to leave twenty-four inches out of the ground, with a ball seven inches long, to fit the top. These, like the bat and ball, must be dressed in the skin of the young cricketeer. They should be placed directly opposite to each other at the distance of twenty-two yards for men, but varying according to the size of the player.

The bowling-crease should be in a line with the wicket, and have a return-crease.

The popping-crease should be three or four feet from the wicket, and exactly parallel with it.

THE BOWLER.

Bowling is a very important part of the game, and requires great steadiness. Bad bowling is often the cause of losing a game. A bowler should not be too systematic, but vary his balls faster or slower, according to the peculiarities of the striker. The bowler and his partner at the opposite wicket should have a secret sign, by which they may hint to each other the propriety of varying the direction or swiftness of the balls. The mode of bowling most generally approved of, is to hold the ball with the seam across, so that the tips of the fingers may touch; it should be held with just a sufficient grasp to keep it steady; by a turn of the wrist it may be made to cut and twist after it is grounded, which will frequently perplex expert players.

THE STRIKER, OR BATSMAN.

The striker should always be ready for running; when his partner is about to strike, he should stand before the popping-crease, but he must be cautious not to leave the ground before the ball is out of the bowler's hand; for if he do, the bowler may put down his wicket, and he will of course be out. As soon as the ball is delivered, the striker may follow it, but should not run too far, so that, if no runs be obtained, he may return in time to save his wicket. The bat should be kept on the outside of the opposite partner, and care taken not to run against him.

THE WICKET-KEEPER.

The wicket-keeper should not suffer the striker to move from his ground without knocking down his wicket, which is called "stumping out."

THE FIRST SHORT-SLIP.

The first short-slip should stand so as to reach within two feet of the wicket-keeper; if the latter should go from the wicket after the ball, the first short-slip should take his place until his return; but no player should take the ball before the wicket-keeper, provided it be coming straight to him.

THE POINT.

The point should place himself in the popping-crease, about seven yards from the strike. In backing up, he should take care to give the slip sufficient room.

LEG, OR HIP.

Leg, or hip, should stand a little back from the straight line of the popping-crease.

LONG-STOP.

Long-stop should stand a proper distance behind the wicket, to save a run if the ball should not be stopped by the striker or wicket-keeper. The person who is placed in this situation should not be afraid of the ball when bowled swift. He should also be able to throw in well, as it is not only to the balls that pass the wicket-keeper, but to such as are just tipped with the edge of the bat, that he will have to attend. He must also be attentive in backing up.

THE LONG-SLIP TO COVER THE SHORT-SLIP.

This player must stand about the same distance from the wicket as the long-stop, in a line with the striker, between the point and the short-slip.

TO COVER THE POINT AND MIDDLE-WICKET.

This player's place is on the off-side, so that if the ball should be hit to the point and middle-wicket man, and missed, he will be in readiness to receive it.

THE LONG-FIELD OFF-SIDE.

He should be placed on the off-side, between the middle-wicket man and the bowler, at a considerable distance in the field, so as to cover them. It is desirable to appoint a person to this situation who can throw well and judiciously.

LONG-FIELD ON-SIDE

Long-field on-side is at some distance wide of the bowler's wicket, so as to prevent a second run.

If there be more players, they may be placed to back up, or save runs, in different situations about the field.

LAWS OF CRICKET.

The bowler should deliver the ball with one foot behind the bowling-stump, and with the return-crease. He should bowl four balls before a change of wickets, which he is to do but once in the same innings. He must be careful to toss the ball in such a way that the striker can play at it; for if he should toss it above the striker's head, or out of the bounds of the bowling-crease, the party which is in shall be allowed one notch, to be put down to the eyes; and such ball is not to be considered as one of the four balls. When the umpire calls "In ball," the hitter may strike at it, and get all the runs he can. When an exchange of bowler takes place, no more than two balls can be allowed for practice. If the arm be extended straight from the body, or the back part of the hand be uppermost when the ball is delivered, the umpire shall immediately call "No ball."

The striker, or batsman, is always out when the ball is knocked off the stump; when the stump is bowled out of the ground; or, if the ball should, from a stroke over or under his bat, or upon his hands (but not his wrists), be held before it touches the ground, even if it should be pressed to the body of the catcher; or if, while he is striking, or at any other time when the ball is in play, both his feet are over the popping-crease, and his wicket put down, except when his bat is on the ground within it. Likewise if he hit down his own wicket; or, if either of the strikers prevent a ball from being caught, the striker shall be out; or, if the ball be struck up, and the hitter wilfully strike it again; or if, in attempting to run a notch, the wicket be struck down by a throw or with the ball in hand, before his foot, hand, or bat is grounded over the popping-crease. If the striker remove or take up his ball while in play, without being requested by the opposite party; or if, with his leg or foot, he stop a ball which has been pitched in a straight line to the striker's wicket. If "a lost ball" be called, the striker shall be allowed four notches. If the players have crossed each other in running, he that runs for the wicket which is put down, shall be out; but if they have not crossed each other, he that has left the wicket which is put down, shall be out.

When a ball is caught, no notch shall be reckoned. When a striker is run out, the notch they were running for shall not be reckoned. While the ball is kept in the bowler's or wicket-keeper's hand, it is considered no longer in play, nor are the strikers bound to keep within their bounds till the umpire has called "Play;" before a player should go out of his ground, with intent to run, he must first be asked by the umpire to do so. If a player is struck by a ball, or otherwise, during his play, he may retire from his wicket, and continue his innings; and another person may be permitted to stand out for him, but not go in. If any player should stop the ball intentionally with his bat, it shall then be considered dead, and the opposite party may add five notches to the batsman's score.

If the ball be struck up, the striker may guard his wicket either with his bat or his body. If the striker hit the ball against the wicket of his partner when he is off his ground, he is out, if he have previously touched the bowler's or any of the field-men's hands, but not otherwise.

Two minutes are allowed for each man to come in, and fifteen minutes between each innings; when, upon the umpire calling "Play," the party refusing to play shall lose the match.

The umpire should observe the situation of the bowler's foot when he delivers the ball, and if it be not behind the bowling-crease, and within the return-crease, he shall call "No ball." If the striker should run a notch, the umpire shall call "No notch." The umpire at the bowler's wicket has a right to be first applied to for his decision on the catches.

SINGLE WICKET.

The game of single wicket is not so interesting as that of double wicket; but it may be played by almost any number of persons, though it is seldom played with more than four or six on a side. The business of a bowler and striker is nearly the same as in double wicket.

When the striker runs to the bowler's wicket, and knocks the ball from off two stumps placed there, with his bat, and returns to his own wicket, without having been asked down by the umpire, he is entitled to count one notch. After he has run one notch, if he start for another, he must touch the bowling-stump, and turn again before the ball crosses the play, to entitle him to another notch. He is entitled to three notches for a lost ball.

If four or a less number are at play, then they should make all hits before the wicket with bounds, &c., and not move off the ground except by agreement. When there are more than four players on a side, there should be no bounds; and all hits, byes, and overthrows, should be allowed. It is of course to be understood that the bowler must bowl at the usual distance from the wicket. No more than one minute is to be allowed between each ball. When the striker hits the ball, one of his feet must be on the ground, except behind the popping-crease, otherwise the umpire shall call "No hit." The field-man must return the ball, so that it shall cross the play between the wicket and the bowling-stump, or between the wicket and the bounds; the striker may run till the ball shall be so returned. These are the principal rules and regulations, adopted by the most experienced cricket-players at the game of single wicket. The distance between the wickets is nearly the same as in double wicket, consequently the runner has twice the ground to win, in obtaining each notch; but we would suggest that this evil might be remedied by running only a little more than half the usual distance; by this method, single wicket will be rendered much less fatiguing, and far more lively and amusing, at least to the batsman.

DIAMOND MILL OF AMSTERDAM.

The diamond mill is one of the most interesting objects in Amsterdam. It is the property of a Jew, whose son, a clever lad, obligingly conducted us through the rooms, and explained the various parts of the process of polishing diamonds. Four horses turn a wheel, setting in motion a number of smaller wheels in the room above, whose cogs, acting on circular metal plates, keep them in continual revolution. Pulverized diamond is placed on these; and the stone to be polished, fastened at the end of a piece of wood by means of an amalgam of zinc and quicksilver, is submitted to the friction of the adamantine particles. This is the only mode of acting on diamond, which can be ground, and even cut, by particles of the same substance. In the latter operation, diamond dust is fixed on a metal wire that is moved rapidly backwards and forwards over the stone to be cut. You are probably aware of the distinction between a rose diamond and a brilliant. The one is entire and set vertically, the other is divided, and set horizontally. The largest diamonds are reserved for roses, which always rise in the centre to an angle; the smaller are used as brilliants, and have a flat octagon on the upper surface.—*Elliot's North of Europe.*

YARROW UNVISITED.

Written in 1803.

By WILLIAM WORDSWORTH.

From Stirling Castle we had seen
The mazy Forth unravell'd;
Had trod the banks of Clyde and Tay,
And with the Tweed had travell'd,
And when we came to Clovenford,
Then said my "winsome Marrow,"
"Whate'er betide, we'll turn aside,
And see the braes of Yarrow."
"Let Yarrow folk frae Selkirk town,
Who have been buying, selling,
Go back to Yarrow, 'tis their own,
Each maiden to her dwelling!
On Yarrow's banks let herons feed,
Hares couch, and rabbits burrow!
But we will downwards with the Tweed,
Nor turn aside to Yarrow.
There's Gala Water, Leader Haughs,
Both lying right before us;
And Dryburgh, where, with chiming Tweed,
The liltwhites sing in chorus;
There's pleasant Teviotdale, a land
Made blithe with plough and harrow:
Why throw away a needful day
To go in search of Yarrow?
What's Yarrow but a river bare
That glides the dark hills under?
There are a thousand such elsewhere
As worthy of your wonder."
—Strange words they seemed of slight and scorn;
My true-love sighed for sorrow;
And looked me in the face, to think
I thus could speak of Yarrow!
Oh, green, said I, are Yarrow's holms,
And sweet is Yarrow flowing!
Fair hangs the apple frae the rock,
But we will leave it growing.
O'er hilly path, and open strath,
We'll wander Scotland through;
But, though so near, we will not turn
Into the dale of Yarrow.
Let beebes and homebred kine partake
The sweets of Burn mill meadow;
The swan on still St Mary's lake
Float double, swan and shadow!
We will not see them, will not go,
To-day, nor yet to-morrow;
Enough if in our hearts we know
There's such a place as Yarrow.
Be Yarrow's stream unseen, unknown!
It must, or we shall rue it;
We have a vision of our own;
Ah! why should we undo it?
The treasured dreams of times long past,
We'll keep them, winsome Marrow!
For when we're there, although 'tis fair,
'Twill be another Yarrow!
If care with freezing years should come,
And wandering seem but folly,
Should we be loth to stir from home,
And yet be melancholy;
Should life be dull, and spirits low,
'Twill soothe us in our sorrow,
That earth has something yet to show,
The bonny holms of Yarrow.

HALIFAX, IN NOVA SCOTIA.

Halifax, the capital of Nova Scotia, is built on the east side of a peninsula, facing an inlet of the sea, and on the declivity of a hill which rises gradually from the water. In length it is rather more than two miles, and about half a mile in breadth. The streets are wide, and cross each other generally at right angles, but that only next the water is paved; most of the others, however, are macadamised, and, from the ascent, and nature of the ground, usually dry; but in summer, the dust, which is often whirled furiously along by the winds, is exceedingly disagreeable. The appearance of Halifax from the water, or from the opposite shore, is prepossessing and peculiar. The front of the town is lined with wharfs, alongside of which vessels of all sizes, and variously rigged, are incessantly discharging or loading their cargoes. Warehouses rise over the wharfs as well as in different parts of the town; and dwelling-houses and public buildings rear their heads over each other as they stretch along, and up the sides of the hill. The spires of different churches; the building above the town, in which the town clock is fixed; a rotunda-built church; the signal posts on Citadel Hill; the different batteries; the variety of style in which the houses are built, some of which are painted white, some blue, some red, and some built of brick and stone intermixed with those built of wood; rows of trees showing themselves in different parts of the town; his majesty's ship moored opposite the dock-yard; the establishments and tall sheers of the latter; the merchant ships under sail, at anchor, or alongside the wharfs; the woody and rocky scenery of the back-ground, with the islands and the small pretty town of Dartmouth, on the eastern shore; are all objects which strike most forcibly on the view of a stranger when sailing up the harbour. The number of dwelling-houses is estimated at about 1700, the public buildings 82, and the population, exclusive of the army and navy, about 16,000. The houses are very irregularly built, some being one, some two, some three, and a few four stories high. Hand-some stone and brick buildings are built and furnished in the English style; and many of the houses built of wood are really more imposing in their appearance, being large, neatly finished, and painted white, than the best stone houses.—*McGregor's British America.*

HIGHLAND HARDIHOOD.

JOHN, the second Lord Reay, son of the unfortunate royalist, Donald, the first Lord Reay, and chief of the clan Mackay, was long kept in confinement in the tolbooth of Edinburgh, during the troubles of the Commonwealth, but at length, as is related by tradition, effected his escape in a manner well worthy of recording. His lady, the daughter of Mackay of Scaury, was uncommonly beautiful and handsome; and having been introduced to the Protector Cromwell, she fell on her knees before him, and in the most impressive manner begged that her husband might be liberated. He was so struck with her beauty and deportment, that he said he would do all that lay in his power to gratify her. Lord Reay, he added, was a state prisoner, and he could not of himself order his liberation; but if she could manage so as to get him out of prison, he would grant him a protection or pass to secure him from farther trouble, and which he delivered to her accordingly. A great difficulty still remained, how to get his lordship beyond the prison wall. His lady and his faithful servant, John Mackay, it seems, always had free access to him. There were two grenadiers placed before the entry to the prison, as guards—a duty performed in later times by the members of an ancient civic militia, called the Town Guard. John said, if Lady Reay could get his lordship brought that length, he would, at the hazard of his life, prevent the sentinels from obstructing him in his escape. The lady got her part effected; and as Lord Reay was ready to advance towards the sentinels, John suddenly laid hold of them both, and with the greatest ease laid them prostrate, the one above the other, and then disarmed them. As his master was now under cover of the protection, John surrendered himself, and was immediately put in prison, and laid in irons. He was afterwards brought to trial, at which Cromwell himself assisted. He said that the servant had no doubt forfeited his life; but his conduct, which went to obtain his master's liberty, and perhaps to save his life, was heroic; and if this man was put to death for an act of this nature, which proceeded wholly from his fidelity to his master, and was attended with nothing hurtful in itself, it would discourage their own and other servants from entertaining that degree of attachment to their masters, which a pardon granted to this prisoner would insure. His opinion, therefore, was, that, for the sake of justice, the prisoner should be condemned to die: but that, in the circumstances of the case, the punishment should be remitted, which was agreed to unanimously. After the sentence was intimated to Mackay, Cromwell took a full view of his person, and noticing his fierce aspect and athletic frame, exclaimed to those around him, "May I ever be kept from the devil's and that man's grasp."

INSECTS IN THE STOMACH.

In the country parts of Scotland we often hear stories related of people swallowing, by accident or unwittingly, small reptiles or insects, which live and breed in the stomach, and put the unhappy person who has received them to great pain. There is reason to believe that these stories are in general fabrications, or that they are greatly exaggerated. It is found that, except in rare cases, no animal can live in the stomach, from its heat, and from the juices which prevail in it. Worms of a certain description, however, can exist with perfect security in the stomach and intestines. We are informed that 1200 species of these intestinal worms have been discovered, and that sixteen of these have been found in the human body. Some of these worms are thin, flat, like pieces of tape, and others are round, or consist of a sort of elongated cartilage in joints. "That insects were, in some rare cases (says the author of *Insect Transformations*) introduced into the human stomach, has been more than once proved; though the greater number of the accounts of such facts in medical books are too inaccurate to be trusted. But one extraordinary case has been completely authenticated, both by medical men and competent naturalists, and is published in the *Dublin Transactions*, by Dr Pickells of Cork. 'Mary Riordan, aged 28 years, had been much affected by the death of her mother, and at one of her many visits to the grave, seems to have partially lost her senses, having been found lying there on the morning of a winter's day, and having been exposed to heavy rain during the night. When she was about fifteen, two popular Catholic priests had died, and she was told by some old women that if she would drink daily, for a certain time, a quantity of water mixed with clay taken from their graves, she would be for ever secure from disease and sin. Following this absurd and disgusting prescription, she took from time to time large quantities of the draught. Some time afterwards, being affected with a burning pain in the stomach, she began to eat large pieces of chalk, which she sometimes also mixed with water, and drank. Now, whether in any or in all of these draughts she swallowed the eggs of insects, cannot be affirmed; but for several years she continued to throw up incredible numbers of grubs and maggots, chiefly of the churchyard beetle. 'Of the larvæ of the beetle,' says Dr Pickells, 'I am sure I considerably underrate, when I say that not less than 700 have been thrown up from the stomach at different times since the commencement of my attendance. A great proportion were destroyed by herself to avoid publicity; many, too, escaped immediately by running into holes in the floor.' Upwards of 90 were submitted to Dr Thomson's examination, nearly all

of which, including two of the specimens of the weal worm, I saw myself thrown up at different times. The average size was about an inch and a half in length, and four lines and a half in girth. The larvæ of the bipterous insect, though voided only about seven or eight times, according to her account, came up almost literally in myriads. They were alive and moving.' Altogether, Dr Pickells saw nearly 2000 grubs of the beetle, and there were many which he did not see. Mr Clear, an intelligent entomologist of Cork, kept some of them alive for more than twelve months. Mr S. Cooper cannot understand whence the continued supply of the grubs was provided, seeing that larvæ do not propagate, and that only one proper and one perfect insect were voided; but the simple fact that most beetles live several years in the state of larvæ, sufficiently accounts for this. Their existing and thriving in the stomach, too, will appear less wonderful from the fact, that it is exceedingly difficult to kill this insect; for Mr Henry Baker repeatedly plunged one into spirits of wine, so fatal to most insects, but it revived, even after being immersed a whole night, and afterwards lived three years. That there was no deception on the part of the woman, is proved by the fact that she was always anxious to conceal the circumstance, and that it was only by accident that the medical gentlemen, Drs Pickells, Herrick, and Thomson, discovered it. Moreover, it does not appear that, though poor, she ever took advantage of it to extort money. It is interesting to learn that, by means of turpentine in large doses, she was at length cured."

SLOGANS, OR WAR-CRIES.

THE war-cry may be traced up to the earliest ages amongst the most ancient people, and it seems, till a recent period, to have been almost universal. Sometimes the cry was of an invocatory nature for protection; at other times it was commemorative of some signal transaction; and in many cases it was a shout of allusion to a well-known place of rendezvous. The Irish, in all cases, used the interjection, *aboo*, along with their war-cries, as *Butler-aboo*, *Cromaboo*, *Leamh-dearg-aboo*, and so forth. The Scots-Irish brought with them the ancient custom of war-cries, though they dismissed the affix *aboo*; and for a long period they used a general cry before the onset began, shouting with an allusion to their native country and their generic name, *Albanich*. After the Saxon tongue was introduced into North Britain, the war-cry was called the *slogan* or *slogan*, from the word *slag*, signifying an alarm of war. The Highland chiefs were most tenacious of their war-cries. The chief of the Mackenzies had for his slogan, *Tulloch-ard*, or the high hill; the mountain particularly signified being one of the most lofty in Kintail, and being that on the summit of which a flaming beacon was shown when it was wished that the clan should gather. The chief of the numerous clan of the Grants had the war-cry of *Craig-ealachie*, or the rock of alarm, which rocky eminence is situated in the country of the Grants in Strathspey. The chief of the Macphersons had *Craig-ubbe*, or the black rock, from a small but well-known black rock in Badenoch, the country of the Macphersons. The chief of the Macdonalds had *Craig-an-Fhithich*, the rock of the raven. The chief of the Macfarlanes had *Loch Sloy*, a place in the district of Arrochar, at the head of Loch Lomond. The chief of the Macgregors had *Ard Chaillich*. The chief of the Buchanans had *Clareinch*, which is an island in Loch Lomond, where he anciently resided. The Lowland barons had likewise their slogans. The war-cry of the potent family of the Scotts of Buccleuch was *Alemoor*, from its commodious situation in the midst of the clan. The cry of the retainers of the Earls of Home was, *A Home, a Home*; that of the Douglasses, *A Douglas, a Douglas*; and that of the house of Winton, *A Seaton, a Seaton*. The Maxwells had for their cry, *I bid you bide, Ward-law*, which is the hill above Caerlaverock Castle, where the clan rendezvoused. The Johnstons, when they were the wardens of the borders, assumed for their slogan, *Light, thieves all*, which was the command of the warden to alight from their horses, and submit to the law. During the change of customs, ancient families converted their war-cries into *mottoes*, which they placed upon escrols above their crests; as the Dukes of Lennox, like the Duke of Leinster, assumed the war-cry of the family, *Aaant Darnley*, as an appropriate motto for their armorial crests.

EASTER HUNT AT EPPING.

Fitzstephen informs us that the hunting at Epping and round London, at Easter time, commenced in 1226, when King Henry the Third confirmed to the citizens of London, free warren, or liberty to hunt a circuit about their city, in the warren of Staines, Hainault forest, &c.; and in ancient times, the lord mayor, aldermen, and corporation, attended by a due number of their constituents, availed themselves of this right of chase in solemn guise. From newspaper report, it appears that the office of Common Hunt, attached to the mayoralty, is in danger of desuetude. The Epping hunt seems to have lost the lord mayor and his brethren in their corporate capacity, and the annual sport to have become a farcical show.

CURIOUS TYPOGRAPHICAL ANECDOTE.

It is well known to literary people, that, in preparing works for the press, it is usual for the printer, after the proof sheets have been seen by the author, to go over them again, and clear them of what are called typographical errors, such as wrong spellings, inaccuracies of punctuation, and similar imperfections. In performing this office for a celebrated northern critic and editor, a printer, now dead, was in the habit of introducing a much greater number of commas than it appeared to the author the sense required. The case was provoking, but did not produce a formal remonstrance, until Mr W—— himself accidentally afforded the learned editor an opportunity of signifying his dissatisfaction with the plethora of punctuation under which his compositions were made to labour. The worthy printer, coming to a passage one day which he did not understand, very naturally took it into his head that it was unintelligible, and transmitted it to his employer, with a remark on the margin, that "there appeared some obscurity in it." The sheet was immediately returned, with this reply, which we give *verbatim*. "Mr J. sees no obscurity here, except such as arises from the quantity of commas, which Mr W—— seems to keep in a pepper-box beside him, for the purpose of dusting all his proofs with."

A LIDDESDALE OUTLAW.

The following tradition may be taken as illustrative of the character of the ancient borderers. Veitch of Dawick (a place in the upper part of Peeblesshire), a man of great strength and bravery, who flourished in the sixteenth century, was, it seems, upon bad terms with a neighbouring proprietor, Tweedie of Drummelyer. By some accident, a flock of Dawick's sheep had strayed over into Drummelyer's grounds, at the time when *Dickie of the Den*, a Liddesdale outlaw, was making his rounds in Tweeddale. Seeing this flock of sheep, he drove them off without ceremony. Next morning, Veitch, perceiving his loss, summoned his servants and retainers, laid a bloodhound upon the traces of the robber, by whom they were guided for many miles, till, on the banks of Liddel, he stayed upon a very large hay-stack. The pursuers were a good deal surprised at the obstinate pause of the bloodhound, till Dawick pulled down some of the hay, and discovered a large excavation, containing the robbers and their spoil. He instantly flew upon Dickie, and was about to poniard him, when the murderer, with the address for which the border thieves were famed, protested that he would never have touched a *cloot* (hoof) of them, had he not taken them for Drummelyer's property. This dexterous appeal to Veitch's passions was the means of saving the life of the freebooter.

THE LION IN THE SCOTTISH SHIELD.

Antiquaries have found considerable difficulty in settling at what precise period the Scottish nation began to assume armorial bearings, although the obscure records of tradition assure us that they were first granted to the Scottish kings by Charlemagne. One thing is sufficiently certain, that none of the predecessors of William, who began to reign in the year 1165, adopted a court armorial, and that it was that sovereign who first assumed the cognisance of a lion on his banners, from which circumstance, as well as from his gallant bearing, he was termed *William the Lion*. We are told that the king of the beasts was anciently the cognisance of the Celtic nations, yet it is conjectured by George Chalmers, that William did not assume the red lion on that account, but rather because it was already the armorial bearing of the earldom of Huntingdon, and, as such, the cognisance of William's father. The lion is first seen on the shield of Alexander the Third, and appeared on gold coins in the reign of Robert the Third. It is said by Nisbet that the double tressure (or border) was anciently used on the royal shields to perpetuate the various leagues betwixt the French and Scottish monarchs. In the reign of James the Third, when the English faction predominated in the country, parliament was induced to ordain "that in tyme to cum their sould be na double tressour about the kingis armys, but that he sould ber hale armis of the lyoun, without any mair." Yet the double tressure seems to have maintained its place in the armorial bearings of Scotland, even to our own times.

GERMAN PHILOSOPHERS.

On several occasions (says Hodgskin, in his *Travels in Germany*), I have mentioned the taste for trifles and absurdities which yet so much distinguishes scientific Germans, that their country is sometimes called a madhouse of natural philosophers. This unhappy propensity has undoubtedly been invigorated by the honours bestowed on such pursuits by the numerous sovereigns of Germany. At Cassel I was informed by a physician at Heidelberg, who, in the madness of scientific or rather witchcraft experiments, prescribed human brains to be taken inwardly, as a cure for violent fevers, and he had worked something like a wonder on his patients, probably by affecting their imagination. Another celebrated man had lately adopted the entrails of cats as a specific for all disorders. And a public newspaper, while it announced the death of a child of a celebrated physician, also announced his intention of preserving it in his anatomical museum, along with some more of his children already deceased.

TOWNS IN THE DESERT.

The extraordinary strength of the buildings in some parts of Syria has excited the surprise of most travellers. "In periods of misrule," says Buckingham, "one town becomes suddenly deserted, and another re-peopled, at short intervals of time; and the edifices in each being of the most durable kind, they remain uninjured, and thus serve for the habitations of race after race, descending through many generations. For the same reasons, the houses may be said to be without permanent owners, the first occupier holding his right indisputable, until he is forced by some sudden emergency to quit it; when the next occupier enters, and retains it on the same condition, no rent or taxes being paid in either case, any more than would be if a man lived in his own tents, or in a natural cavern which he might find suited to his purpose, and adopt for his abode. As there are in general more houses in these everlasting and indestructible towns than there are persons at any one time requiring to occupy them, an ample choice is afforded to all parties, but particularly to the earliest comers; and as no one has a permanent interest in the security of any one particular dwelling, very little attention is paid to improving them. The buildings are in themselves so strong, being wholly composed of stone, including roofs, and even doors, that they never need repairs. The doors have no hinges, being attached at the top and bottom with a pivot of stone. In times of great danger, when a visit from the Arabs of the desert is apprehended, the inhabitants either retire to some other town, or barricade themselves in their houses, by heaping up loose stones to oppose the approach of horsemen to the most defenceless parts of their dwellings, while they can assail them with the same material as missiles from the terraces above."

SPANISH POLITENESS.

Near Naval-Moral, we met a Spanish family of rank travelling, a sight very uncommon. The ladies and female attendants were seated in a large, heavy, old-fashioned carriage, covered with carved work and tarnished gilding. This vehicle was drawn by eight mules, which two fine-looking men on foot guided solely by the voice, calling out their names, to which they appeared by their movements to answer with great docility. The gentlemen of the party rode with the male servants, all conversing familiarly together; and the last often put their heads into the carriage-window, and spoke to the ladies. The Spaniards, I have often observed, however exalted their rank, are exceedingly kind and affable to their servants and inferiors. And, indeed, the lower classes have much natural politeness; nor is there any thing in their language or manner which disgusts or offends. They have no vulgarity in their freedom, nor servility in their respect. I have often sat round the fire of a Posada, amid Spaniards of all classes, whom chance had assembled together, and been quite charmed to mark the general good humour, and the easy, unembarrassed propriety of behaviour of the common peasants.—*Recollections of the Peninsula.*

UN MOMENT DE PEUR.

Bonaparte lost four aide-de-camps during the short time he was in Egypt. One of them, Croisier, appearing to Napoleon to lack the proper degree of boldness at the proper moment, he burst out against him in one of his violent and humiliating attacks of abuse and contempt. The word "coward" escaped him; Croisier determined not to survive it; he sought death on several occasions, but did not succeed till the siege of Acre. He was in attendance on Napoleon in the trenches there, when such a sharp look-out was kept by the garrison, that if an elbow or feather showed itself above or beside them, it was immediately grazed by a bullet. Croisier watched his opportunity, and jumped upon the platform. "Come down, I command you," cried Napoleon, in a voice of thunder; but it was too late—the victim of his severity fell at his feet. Murat, the chivalrous braver of all danger, had also his *moment de peur* (moment of fear), which lost him the countenance of his general, until displeasure could no longer resist the brilliancy of his achievements. It was at the siege of Mantua, in the first Italian campaign, that Murat was ordered to charge a body of troops that were making a sortie from the garrison. He hesitated, and in his confusion declared himself wounded—he was removed from the presence of the general—he was in every way discounted; in Egypt he was sent on the most distant and dangerous services; in short, he more than reconquered his character before the battle of Aboukir, on which occasion Napoleon himself was obliged to declare he was *superb*. The brave Marshal Lannes one day severely reprimanded a colonel who had punished a young officer for a *moment de peur*. "That man," said he, "is worse than a poltroon who pretends that he never felt fear."

ALWAYS DRUNK.

Lord Newton, an eminent judge in the Court of Session, about the beginning of the present century, was an extraordinary bacchanal, even at the time when all were bacchanalian. He was proposing to buy an estate; and he mentioned to his friend and crony, J——, that he should like it to be one with a well-sounding name, as he might perhaps take his title from it. "Weel, my lord," answered J——, "there's the yestate o' *Drunkie* in the mercat; buy it, and then ye'll no need to tak it amiss when folk say ye're *drunk aye*."

DR PITCAIRNE.

Dr Alexander Pitcairne, who died in 1713, but who is yet remembered most distinctly in Scotland for his strong Jacobitism, his keen wit, and his eminence as a physician, studied his profession in Holland, where he was for some time the preceptor of Boerhaave. His political principles causing him to be no friend to the republican Dutch, he amused himself with satirising them in verse. Dull, however, as the Dutch are generally esteemed, they had once paid him very smartly in his own coin. Pitcairne, it seems, took great offence at the facility with which the University of Leyden, like some of those in this country at a more recent period, conferred degrees upon those applying for them. To ridicule them, he sent for a diploma for his footman, which was granted. He next sent for another for his horse. This, however, was too gross an affront for even a Dutchman to swallow. In a spirit of resentment, an answer was returned, to the effect, that, "search having been made in the books of the University, they could not find one instance of the degree of doctor having ever been conferred upon a horse, although, in the instance of one Dr Pitcairne, it appeared that the degree had once been conferred on an ass."

A MID-LOTHIAN TRADITION.

A tradition exists in Mid-Lothian relative to a house on the barony of Gilmerton, near Lasswade, which has given occasion to the beautiful ballad entitled "The Gray Brother," by Sir Walter Scott, and which is said to be of the following purport:—The building alluded to, now called Gilmerton Grange, was originally named Burndale, from the following tragic adventure. The barony of Gilmerton belonged of old to a gentleman named Heron, who had one beautiful daughter. This young lady was seduced by the abbot of Newbottle, a richly-endowed abbey on the banks of the South Esk, now a seat of the Marquis of Lothian. Heron came to the knowledge of this circumstance, and learned also, that the lovers carried on their intercourse by the connivance of the lady's nurse, who lived at the house of Gilmerton Grange. He formed a resolution of bloody vengeance, undeterred by the supposed sanctity of the clerical character, or by the stronger claims of natural affection. Choosing, therefore, a dark and windy night, when the objects of his vengeance were engaged in a stolen interview, he set fire to a stack of dried thorns, and other combustibles, which he had caused to be piled against the house, and reduced to a pile of glowing ashes the dwelling, with all its unfortunate inmates.

THE FEAR OF ABERDEEN.

During a late jury trial at Jedburgh, in which three of the first luminaries of the bar (Messrs M-n-cr-f, J-f-r-y, and C-c-k-b-r-n) were engaged as counsel, while the former was addressing the jury, Mr J-f-r-y passed a slip of paper to Mr C-c-k-b-r-n with the following case for his opinion:—"A legacy was lately left by an old lady to the *Peer of Aberdeen*. As the will was written by the dowager herself, and by no means distinguished for correctness of orthography or expression, a dispute has arisen as to the intent of the testator, and the following claimants have appeared for the legacy—1st, The Earl of Aberdeen; 2d, The commissioners for erecting the pier at Aberdeen; and, 3d, The manager of the charity workhouse, who grounds his right on the fact that the old lady was in the habit, *more majorum*, of pronouncing poor, *peer*. To which of the parties does the money belong?" Mr C-c-k-b-r-n immediately wrote in answer—"To none of the three; but to the Horticultural Society of Scotland, for the purpose of promoting the culture of a sort of fruit called, or to be called, the *Pear of Aberdeen*."

NATIONAL SALUTATIONS.

The common mode of salutation in Holland curiously exemplifies the remark, that the expressions used by various nations in token of friendly greetings bear reference to the object they most esteem, and bespeak their habits or general tone of feeling. The Greek and Roman salutations may be adduced as instances in point; so may the English, French, and Italian; nor can we forget the tranquillity and repose implied in the oriental word "*salaam*." To these and other characteristic expressions may be added the Dutchman's "How do you navigate?" Even on the water or in the water, the ideas of this amphibious people are inseparably connected with the element which they alone have subjected; and the words, which I have translated literally, inappropriate in any other mouth, are amply addressed by the Hollander to his aquatic brother.—*Elliot's North of Europe.*

EDINBURGH: Published by WILLIAM and ROBERT CHAMBERS, No. 19, Waterloo Place.—Agent for Glasgow, JOHN MACLEOD, 20, Argyll Street.

Subscribers in town may have the Paper left at their houses every Saturday morning, by leaving their addresses at 19, Waterloo Place. Price of a quarter of twelve weeks, 1s. 6d.; of a half year of twenty-four weeks, 3s.; and of a year, 6s. 6d. In every case payable in advance.

In LONDON, an Edition is published, with the permission of the Proprietors, by WILLIAM ORR, Paternoster-row, for circulation throughout England and Wales.

Typography executed by W. and R. CHAMBERS; stereotyped by A. KIRKWOOD; and printed by BALLANTYNE and COMPANY, Paul's Work.

CHAMBERS' EDINBURGH JOURNAL

CONDUCTED BY WILLIAM CHAMBERS, AUTHOR OF THE "BOOK OF SCOTLAND," "GAZETTEER OF SCOTLAND," &c.

No. 22.

SATURDAY, JUNE 30, 1832

PRICE THREE HALF-PENCE.

A CHAPTER OF POLITICAL ECONOMY.

WRITTEN FOR THE BRITISH PEASANTRY.

THE monstrous absurdity, that there is a principle in the economy of nature by which population increases beyond the means of support, has been stated by men eminent in various departments of political economy, and countenanced by individuals in whom the soundest reasoning and far-sightedness might have been expected. There is *not* a principle in nature having a tendency to increase population beyond the means of subsistence, or to over-people the world. To suppose that there is, is to impugn the magnificent designs of the Creator, and to call in question his vigilant and ever-sustaining Providence. When the globe which we inhabit, and all that it sustains in the animal and vegetable kingdoms, was called into existence, and sent forth fresh from the hands of its Divine Constructor, certain fixed principles were ordained and put into unremitting action, by which all were to be sustained, and prevented alike from coming to a stand, or into collision. These principles involved the production and reproduction of food for man and beast through an incalculable series of ages, and this process of production was left to be excited or retarded in a great measure by man, for whose convenience all subordinate parts were organized, and by whose thinking faculties the increase or decrease of food was apparently to be proportioned. In a word, it was left to our free will whether to cultivate the soil, or leave it in its rude and unproductive condition.

It has happened in the course of some five or six thousand years after the creation of the world, that a small island, lying in the seas which border on the northern part of Europe, a spot of earth so comparatively small that it may be traversed from one end to the other in the space of little more than a week, has, by the artificial state of its society, and a course of injudicious regulations, increased in its population to about seventeen millions of inhabitants; and because, as must necessarily be the case from the influence of these regulations, a number of the people are in impoverished circumstances, and are not so well fed as their neighbours, it has, forsooth, pleased a few men in this large mass of humanity to impeach the God of the universe, and to tell us that He creates millions of thinking beings only to put them to death by starvation.

To show the utter fallacy of this detestable theory, I need only bring under your notice two simple facts, in which all such vicious and shallow-minded reasoning finds an insurmountable obstacle to its establishment. It is a great, a comforting, and an undeniable fact, that there are immense tracts of land, islands, and even continents, which, till this hour, are lying in nearly their primeval state, with the soil untouched since the beginning of the world. So boundless are these almost uninhabited territories, so capable are they of sustaining human life, that, if the proper means were used, they would yield food, clothing, and a place of residence to more people than all that the ancient settlements of the human race at present contain. They could hold all the existing population of the earth, and not be filled. Canada itself could receive and maintain the whole of the population of Europe; and the seventeen millions of human beings belonging to the little island which has raised such alarm, might be transported to the banks of one of the mighty rivers in the United States, and it would hardly be known that they had taken up their residence in the country. "Send us over your whole population (says an American writer); we have plenty of room for you all, and a hundred millions more." But such a gratifying fact as this gives but a faint idea of the vastness, the capabilities of the world beyond the waters of the Atlantic. In a former number of the Journal, I honoured these humble pages with the account given by the ingenious naturalist Audubon, of the wild pigeons of America. Have my readers any recol-

lection of the extraordinary number of these animals, and the calculation made regarding the quantity of their daily food? Let me here repeat and extend the calculation. The number of pigeons seen on the wing by Audubon, as computed by allowing two pigeons to the square yard, was *one billion, one hundred and fifteen millions, one hundred and thirty-six thousand*, and "as every pigeon (says he) daily consumes half a pint of food, the quantity necessary for supplying this vast multitude must be *eight millions seven hundred and twelve thousand bushels per day*." The species of food used is the produce of the trees. We thus find that, by a moderate calculation, a single flock of pigeons in the back woods of America consumes in one day as great an amount of food, whether by weight or measure, as would support the whole seventeen millions of people in Great Britain for at least a week. The mind is lost in wonder in contemplation of so magnificent a fact. The faculty of thought is bewildered in pondering on so striking an instance of the astonishing bounty of the great Author of Nature in providing for the wants of his creatures. Where, where, may we then ask, have the predictors of famine been examining the sources of food for man? On what have their eyes and their thoughts been fixed, that they have passed over this prospect of inexhaustible plenty? It would seem that they have never looked beyond the confines of that little spot of land in the ocean which I have alluded to, and whose superabundant thousands require only to be transferred to that division on the earth's surface holding out food, raiment, and residence for their gratuitous acceptance, in order that society may right itself.

The above is the *first* fact I have to offer in the elucidation of this important question; and I maintain, in direct opposition to those who have taken a contrary view of the subject—among whom I am sorry to include persons otherwise distinguished for the clearness and comprehensiveness of their views of the social compact—that until the *whole* earth has been peopled, and until it can hold no more, it cannot rationally be said that the means of subsistence are inadequate for the wants of the population. These means are no more inadequate than that the produce of a kitchen-garden is insufficient to support the family to which it belongs; and if this family be prevented from seeking its subsistence beyond its garden walls, and so be half-starved, their miserable case is exactly parallel with that of this over-populated island. Remove, I would say, all restrictions of a certain description; do not unnaturally foster population either in a particular part of the country, or at a particular time; *LET MANKIND ALONE*; and, in the same manner that fluids find their level, so will the redundant population of Great Britain and Ireland be profitably dispersed over territories hitherto untrod by the footsteps of civilised men.

My *second* fact is more hypothetical, but not less obvious to our understanding. It is an old proverbial expression, that "necessity is the mother of invention." Now, in this sentiment we discover one of the wisest provisions of Providence. It is only by necessity that mankind, in a savage state, are compelled to hunt, or otherwise toil, for their subsistence. The same feeling predominates through all the ramifications of civilised society. In proportion as the necessities of men spur them on to seek out new means of subsistence, so do these new means of subsistence open upon their view. If we cast a retrospective glance upon those steps which society has traced from its infancy to manhood—from a state of barbaric rudeness to a condition of luxury and splendour—we invariably find that all improvements have originated in the wants of the people; and that in proportion as they increased in number, so did they whet their invention, and contrive additional means of support. It is from this cause that Scotland, for instance, had no greater overplus of food when it had only a million of inhabitants than it has now, when

it supports nearly three times the number. Nay, it had much less food in proportion when it had only a million of people; and hence it is proved that mankind, by their inventions and improvements, greatly increase the means of support beyond the point at which they formerly stood. The power of seeking out, or inventing, new means of subsistence, just as the old ones are perceived to be inadequate, has been actively at work since the beginning of time, and will operate for the benefit of our race as long as sun and moon endure. It is in the exercise of this transcendent faculty of the human mind that we see the beneficence of the Creator in providing unseen means of subsistence; and it is in it that we find the cheering hope, that at no period, however distant, even when the *whole* earth shall have been covered with inhabitants, shall mankind languish for lack of food. As they go on increasing in number, so will they go on perfecting their contrivances; every succeeding generation may labour under some new difficulty, but so will it be endowed with the faculty of releasing itself from it.

I have been led into these reflections by cogitating on the probable effects of that species of elemental locomotion in which steam is the active agent, and which appears to come into use for the benefit of our species precisely at the time that the quantity of food produced in this country has begun to be felt as too limited. An exceedingly instructive volume, illustrative of the commercial, political, and moral advantages of elemental locomotion, by means of steam-carriages on common roads, has appeared in London, from the pen of Alexander Gordon, civil engineer; and on turning over its leaves, I am glad to perceive that the same idea, with regard to increasing the amount of food by the introduction of inanimate for animate power, is insisted upon both by the author and by those who have been examined on the question by a committee of the House of Commons.

"The substitution of inanimate for animate power (says Mr Gordon), if not the panacea which is to cure all the evils of our condition, is at least one that comes recommended as a matter of fact—easy of operation and effectual in its result. If want of food, or, in other words, redundancy of population, be the bane of the country, it does not propose to meet that evil by a visionary project, tending in its operation to unhinge society, tedious in its process, and ending at length in bitter disappointment; but it meets the evil directly, substantially, and effectually, by the substitution of [consumers of] food. And how are all these advantages to be effected? By the substitution of inanimate for animate power. At present, the animate power employed in the commercial transportations of this great kingdom is estimated to amount to two millions of horses. Each horse consumes as much food as is necessary for the support of eight men. Hence the conversion of its consumption to purposes of human existence would, if carried to this practical extent, amount to a quantity of food equal to support sixteen millions of people. Now, the suppression of the stage-horses upon our principal thoroughfares, and of the dray-horses in the great commercial towns, may be calculated to economise a saving of food equivalent to the supply of the above human beings. The reduction of farm consumption, the bugbear of the project, will be met and compensated by a steady and proportionate demand from other quarters; whilst in the United Kingdom the 8,100,000 acres of land now required to feed the horses, together with the capital sunk in their purchase, will, when both applied to other and general purposes, amply compensate for the change. If instead of 20,000 horses we keep 30,000 fat oxen, butcher's meat will be always cheap to the operative classes, whilst the quantity of tallow will of course make candles cheap, and so many hides lower the price of leather. Or the same quantity of land may keep 30,000 cows, the milk of which will make both butter and cheese cheaper to the poor, as well

as to the labouring manufacturer. The same thing may be said in favour of more sheep and woollen cloths.

"If, then, elemental locomotion can be made to supersede the expensive unproductive system of animal labour now in use, it will indubitably be for the vital interest of all classes of society that the substitution should be realised speedily and extensively. That steam can be so applied, has been satisfactorily proved by the report of the committee of the House of Commons, in which it was expressed as an opinion that 'the substitution of inanimate for animal power, in draught or common roads, is one of the most important improvements in the means of internal improvement ever introduced.'" It would be needless here to particularise the evidence adduced before the committee, and I may only refer to what was said by Colonel Torrens, M.P. "With respect (says he) to the demand for labour, that demand consists of the quantity of food and raw materials which can be cheaply obtained; and, as by the supposition the displacing of horses will leave at liberty more food, and more material, the demand for labour will ultimately be greatly increased, instead of being diminished. If steam-carriages could ultimately be brought to such perfection as entirely to supersede draught-horses on the common roads (not including horses used for other commercial and for agricultural purposes), there would be food and demand for eight millions of persons. But when we take further into consideration, that lowering the expense of carriage would enable us to extend cultivation over soils which cannot now profitably be tilled, and would have the further effect of enabling us to apply, with a profit, additional portions of labour and capital to the soils already under tillage, I think it not unfair to conclude, that were elementary power on the common roads completely to supersede draught-horses, the population, wealth, and power of Great Britain, would at least be doubled. In point of fact, superseding horses by mechanical power would have precisely the same effect in increasing the population and wealth of England, as would be produced were we to increase the extent of the country, by adding thereto a new and fertile territory, equal in extent to all the land which now breeds all the horses employed upon common roads. Such addition to the extent of fertile territory in England, suddenly effected, would, in the first instance, lower the value of agricultural produce, and be injurious to the proprietors of the old portion of the territory; but no person would therefore contend, that if we would enlarge the island of Great Britain, by additional tracts of fertile land, the public interests would be injured by such enlargement. This would be monstrously absurd. It is not less absurd to object to the increase of food available for human beings, by substituting mechanical power for horses."

My readers may now perhaps be satisfied with what has been said on a topic which has in various shapes already excited a good deal of controversy, and which appears to have been strangely obscured by the elaborate essays of a certain description of political economists. In my humble opinion, it requires neither books nor intricate disquisitions to elucidate those principles which govern the production and consumption of food by man. The very simple facts I have here chosen to bring undisguisedly forward, might, I think, convince every one who does not prefer the mystifications of theorists to plain sense and plain truth, that the doctrine as to the means of subsistence having a constant disposition to fall beneath the demand for food, rests on no sure foundation, is irrational in its character, and, in reality, amounts to a scandalous, though perhaps unintentional, libel on the beneficent designs of Providence.

"O WALY, WALY."

AMONG the ballads of Scotland supposed to refer to real circumstances in private life, we hardly find one which possesses such touching tenderness and melancholy pathos as that beginning—

"O waly, waly, up yon bank,
And waly, waly, down yon brae,
And waly, waly, by yon burn-side,
Where I and my love went to gae!"

"Waly, waly," is a Scottish interjection of bewailment, and, with the remainder of the ballad, refers to a dark and treacherous transaction, in connection with the fate of a Marchioness of Douglas. The story on which the ballad has been founded may be related in a few words.

James, second Marquis of Douglas, when aged twenty-four, married at Edinburgh, on the 7th of September 1670, Lady Barbara Erskine, eldest daughter of John, ninth Earl of Mar. This lady is said to have been previously wooed, without success, by a gentleman of the name of Lowrie, who, on account of his afterwards marrying Mariotte Weir, heiress of Blackwood in Lanarkshire, was commonly called, according to the custom of Scotland, the tutor, and sometimes the laird, of Blackwood. Lowrie, who seems to have been considerably ad-

vanced in life at the time, was chamberlain or factor to the Marquis of Douglas; a circumstance which gave him peculiar facilities for executing an atrocious scheme of vengeance he had projected against the lady. By a train of proceedings somewhat similar to those of Iago, he completely succeeded in breaking up the affection of the unfortunate couple. Lord Douglas, who, though a man of profligate conduct, had hitherto treated his wife with some degree of politeness, now rendered her life so miserable, that she was obliged to seek refuge with her father. The Earl came with a large retinue to carry her off, when, according to the ballad, as well as the tradition of the country, a most affecting scene took place. The Marquis himself was so overcome by the parting of his wife and child—for she had now borne a son—that he expressed, even in that last hour, a desire of being reconciled to her. But the traitorous Lowrie succeeded in preventing him from doing so, by a well-aimed sarcasm at his weakness.

The unhappy pair now parted, the lady lamenting her miserable fate—

Now Arthur's Seat shall be my bed,
The sheets shall ne'er be pressed by me,
St Anton's Well shall be my drink,
Since my true love's forsaken me.
Oh, Martinian wind, when wilt thou blow,
And shake the green leaves off the tree?
Oh, gentle death, when wilt thou come,
And take a life that wears me?

Arthur's Seat is a conspicuous rocky hill rising on the east side of Edinburgh, and St Anton's, or St Anthony's Well, a fountain which springs from its base, near the ruins of a small chapel and hermitage, the tenant of which it must have supplied with water. This pleasing classic spot has been shockingly abused in recent times. The explanation here given of the occasion of the ballad is countenanced by local circumstances. The forlorn Marchioness, in alluding to the period when she was an honoured wife, speaks of a visit to Glasgow, a city near to her husband's residence and estates; in alluding to her present degraded condition, when residing with her father at Edinburgh, she introduces Arthur's Seat and St Anthony's Well, two objects of note in the immediate vicinity of the capital.

Regarding the ultimate fate of the Marchioness, I am altogether ignorant. The ballad concludes in mentioning, that at last a reconciliation took place between her and her husband, and, for the sake of human nature and injured innocence, it is to be hoped that such was the case. Her son was afterwards a personage of some historical note. When only eighteen years of age, he raised the 20th, or Cameronian regiment, a band originally associated in 1689 for the purpose of protecting the Convention of Estates at Edinburgh, while the measure of the revolution was in agitation, but which he afterwards led abroad to fight in King William's French wars. He was killed, in the act of leading on the regiment, at the battle of Steinkirk, in 1692, when only twenty-one years of age. The Marquis of Douglas married a second wife, who bore him the noted Archibald Duke of Douglas, Lady Jane Douglas, and other children; and thus, what is a very strange circumstance, the venerable Lord Douglas, who died in 1827, was but grandson to the "false love" who sent the heroine of "Waly, waly," to take her couch on Arthur's Seat, and slake her thirst at St Anton's Well, in the decade of 1670.

The traitorous Lowrie, laird of Blackwood, distinguished himself in the religious troubles of the reign of Charles II. He had been accessory to the insurrection of 1666, and was condemned to death for his concern in the affair of Bothwell Bridge, but was pardoned. Fountainhall describes him as a man disliked by people of every party and every condition. It seems that Archibald Duke of Douglas used to take great pleasure in hearing the ballad sung, and that an old woman who had been dairy-woman at Douglas Castle was frequently sent for by his Grace to sing it to him. As she doled out the verses to their slow melancholy tune, his Grace wheeled round the room in a gilded chair, muttering imprecations against Lowrie, and sometimes exclaiming aloud, "Oh, that Blackwood must have been a detestable soul." It says something for the heart of the Duke, whatever his general conduct in life says for his head, that he should have thus bewailed the treachery by which his father had permitted himself to be so grievously imposed upon. The old woman who sung the ballad to his Grace usually got a bottle of wine home in her lap, as her minstrel grandson.—(From "THE SCOTTISH BALLADS, collected and illustrated by Robert Chambers.")

A NORWEGIAN TALE.

In one of those short and brilliant nights peculiar to Norway, a small hamlet near its coast was disturbed by the arrival of a stranger. At a spot so wild and unfrequented, the Norwegian government had not thought fit to provide any house of accommodation for travellers, but the pastor's residence was easily found. Thorsen, though his hut hardly afforded room for his own numerous family, gave ready admission even to an unknown guest, and placed before him the remains of a dried torsk-fish, a thrush, and a loaf composed of oatmeal mixed with fir-bark. To this coarse but hospitable banquet the traveller seated himself with a courteous air of appetite, and addressed several questions to his host respecting the produce, customs, and peculiarities of the district. Thorsen gave him intelligent answers, and dwelt especially on the cavern of Dolstein, celebrated for its extent beneath the sea. The traveller listened earnestly, commented in language which betrayed deep science, and ended by proposing to visit it with his host.

The pastor loved the wonders of his country with the pride and enthusiasm of a Norwegian; and they entered the cave of Dolstein together, attended only by one of those small dogs accustomed to hunt bears. The torches they carried could not penetrate the tremendous gloom of this cavern, whose vast aisles and columns

seem to form a cathedral fit for the spirits of the sea, whose eternal hymn resounds above and around it. "We must advance no farther," said Thorsen, pausing at the edge of a broad chasm, "we have already ventured two miles beneath the tide." "Shall we not avail ourselves of the stairs which nature has provided here?" replied the traveller, stretching his torch over the abyss, into which large masses of shattered basaltine pillars offered a possible, but dreadful mode of descent. The pastor caught his cloak—"not in my presence shall any man tempt death so impiously! Are you deaf to that terrible murmur? The tide of the northern ocean is rising upon us; I see its white foam in the depth." Though retained by a strong grasp, the stranger hazarded a step beneath the chasm's edge, straining his sight to penetrate its extent, which no human hand had ever fathomed. The dog leapt to a still lower resting-place, was out of sight a few moments, and returned with a piteous moan to his master's feet. "Even this poor animal," said Thorsen, "is awed by the divinity of darkness, and asks us to save ourselves." "Loose my cloak, old man!" exclaimed the traveller, with a look and tone which might have suited the divinity he named. "My life is a worthless hazard. But this creature's instinct invites us to save life, not to loose it. I hear a human voice!" "It is the scream of the fish-eagle!" interrupted his guide; and exerting all his strength, Thorsen would have snatched the torch from the desperate adventurer—but he had already descended a fathom deep into the gulf. Panting with agony, the pastor saw him stand unsupported on the brink of a slippery rock, extending the iron point of his staff into what appeared a wreath of foam left on the opposite side by the sea, which now raged below him in a whirlpool more deafening than the Malestrom. Thorsen with astonishment saw this white wreath attach itself to the pike-staff; he saw his companion poise it across the chasm with a vigorous arm, and beckon for his aid with gestures which the clamour of waves prevented his voice from explaining. The sagacious dog instantly caught what now seemed the folds of a white garment; and, while Thorsen trembling held the offered staff, the traveller ascended with his prize. Both fell on their knees, and silently blessed Heaven. Thorsen first unfolded the white garment, and discovered the face of a boy, beautiful though ghastly, about eleven years old. "He is not dead yet!" said the good pastor, eagerly pouring wine between his lips from the flask they had brought to cheer them. He soon breathed, and the traveller, tearing off his wet half-frozen vestments, wrapped him in his own furred coat and cloak, and spoke to him in a gentle accent. The child clung to him whose voice he had heard in the gulf of death, but could not discern his deliverers. "Poor blind boy!" said Thorsen, dropping tears on his cheek, "he has wandered alone into this hideous cavern, and fallen down the precipice." But this natural conjecture was disproved by the boy's replies to the few Norwegian words he seemed to understand. He spoke in a pure Swedish dialect of a journey from a very distant home with two rude men, who had professed to bring him among friends, but had left him sleeping, he believed, where he had been found. His soft voice, his blindness, his unsuspicious simplicity, increased the deep horror which both his benefactors felt as they guessed the probable design of those who had abandoned him. They carried him by turns in silence, preceded by their watchful dog; and quenching their torches at the cavern's mouth, seated themselves in one of its most concealed recesses. The sun was rising, and its light shone through a crevice on the stranger's face and figure, which, by enveloping the child in his furred mantle, he had divested of disguise. Thorsen saw the grace and vigour of youth in its contour, features formed to express an ardent character, and that fairness of complexion peculiar to northern nations. As if aware of his guide's scrutiny, the traveller wrapped himself again in his cloak, and, looking on the sleeping boy whose head rested on his knee, broke the thoughtful pause. "We must not neglect the existence we have saved. I am a wanderer, and urgent reasons forbid me to have any companion. Providence, sir, has given you a right to share in the adoption of this child. Dare you accept the charge for one year with no other recompense than your own benevolence and this small purse of dollars?"

Thorsen replied, with the blush of honest pride in his forehead: "I should require no bribe to love him—but I have many children, and their curiosity may be dangerous." "There is a good old peasant whose daughter is his only comfort and companion. Let us intrust this boy to her care, and if in one year—" "In one year, if I live, I will reclaim him!" said the stranger solemnly:—"Show me this woman." Though such peremptory commands startled Thorsen, whose age and office had accustomed him to respect, he saw and felt a native authority in his new friend's eye, which he obeyed. With a cautious fear of spies, new to an honest Norwegian, he looked round the cavern entrance, and led the stranger by a private path to the old fisherman's hut. Claribell, his daughter, sat at his door, arranging the down feathers of the beautiful Norwegian pheasant, and singing one of the wild ditties so long preserved on that coast. The fisherman himself, fresh coloured and robust, though in his ninetieth year, was busied amongst his winter stock of oil and deer skins. Thorsen was received with the urbanity peculiar to a nation whose lowest classes are artisans and poets; but his companion did not wait for his introduction. "Worthy woman," he said to Claribell, "I am a traveller with an unfortunate child, whose weakness will not permit him to accompany me farther. Your countenance confirms what this venerable man has told me of your goodness: I leave him to appeal to it." He disappeared as he spoke, while the blind boy clung to Claribell's hand, as if attracted by the softness of a female voice. "Keep the dollars, pastor!" said Hans Hotland, when he had heard all that Thorsen chose to tell—"I am old, and my daughter may marry Brande our kinsman—keep the purse to feed this poor boy, if the year should pass and no friends remember him."

Thorsen returned well satisfied to his home, but the stranger was gone, and no one in the hamlet knew the time or way of his departure. Though a little Lutheran theology was all that education had given the pastor, he had received from Nature an acute judgment and a bountiful heart. Whether the deep mystery in which his guest had chosen to wrap himself could be connected with that which involved his ward, was a point beyond his investigation; but he contented himself with knowing how much the blind boy deserved his pity. To be easy and useful was this good man's constant aim, and he always found both purposes united.

The long, long winter and brief summer of Norway passed away without event. Adolphus, as the blind boy called himself, though he soon learned the Norwegian language, could give only confused and vague accounts of his early years, or his journey to Dolstein. But his docility, his sprightliness, and lovely countenance, won even the old fisherman's heart, and increased Claribell's pity to fondness. Under Hans Hofland's roof there was also a woman who owed her bread to Claribell's bounty. She was the widow of a nobleman whose mansion and numerous household had suddenly sunk into the abyss now covered with the lake of Frederic-Stadt. From that hour she had never been seen to smile; the intense severity of a climate in which she was a stranger, added to the force of an overwhelming misfortune, had reduced her mind and body to utter imbecility. But Claribell, who had been chosen to attend her during the few months which elapsed between her arrival in Norway and her disastrous widowhood, could never be persuaded to forsake her, when the rapacious heir, affecting to know no proofs of her marriage, dismissed her to desolation and famine. The Lady Johanna, as her faithful servant still called her, had now resided ten years in Hans Hofland's cabin, nursed by his daughter with the tenderest respect, and soothed in all her caprices. Adolphus sat by her side singing fragments of Swedish songs, which she always repaid by allowing him to share her sheltered corner of the hearth; and he, ever ready to love the hand that cherished him, lamented only because he could not know the face of his second foster-mother.

On the anniversary of that brilliant night which brought the stranger to Dolstein, all Hofland's happy family assembled round his door. Hans himself, ever gay and busy, played a rude accompaniment on his ancient violin, while Adolphus timed his song to the slow motion of the Lady Johanna's chair, as it rocked her into slumber. Claribell sat at her feet preparing for her pillow the soft rich fur of the brown forest-cat, brought by Brande, her betrothed husband, whose return had caused this jubilee. While Hans and his son-in-law were exchanging cups of mead, the pastor Thorsen was seen advancing with the stranger. "It is he!" exclaimed Claribell, springing from her kinsman's side with a shriek of joy. Adolphus clung to his benefactor's embrace, Hans loaded him with welcomes, and even the lady looked round her with a faint smile. They seated their guest amongst them, while the blind boy sorrowfully asked if he intended to remove him. "One year more, Adolphus," replied the traveller, "you shall give to these hospitable friends, if they will endure the burthen for your sake." "He is so beautiful!" said old Hans. "Ah, father!" added Claribell, "he must be beautiful always, he is so kind!" The traveller looked earnestly at Claribell, and saw the loveliness of a kind heart in her eyes. His voice faltered as he replied, "My boy must still be your guest, for a soldier has no home; but I have found his small purse untouched—let me add another, and make me more your debtor by accepting it." Adolphus laid the purse in Claribell's lap, and his benefactor rising hastily, announced his intention to depart immediately, if a guide could be procured. "My kinsman shall accompany you," said the fisherman; "he knows every crag from Ardanger to Dofrefield." Brande advanced, slinging his musket behind his shoulder, as a token of his readiness. "Not to-night!" said Claribell; "a snow-fall has swelled the flood, and the wicker bridge has failed."—Thorsen and Hans urged the tedious length of the mountain-road, and the distance of any stage-house. Brande alone was silent. He had thought of Claribell's long delay in fulfilling their marriage contract, and his eye measured the stranger's graceful figure with suspicious envy. But he dared not meet his glance, and no one saw the smile which shrivelled his lips when his offered guidance was accepted. "He is bold and faithful," said the pastor, as the stranger pressed his hand, and bade him farewell with an expressive smile. Brande shrunk from the pastor's blessing and departed in silence. "All were sleeping in Hofland's hut when he returned, pale and almost gasping." "So soon from Ardanger?" said Claribell; "your journey has speeded well." "He is safe," returned her lover, and sat down gloomily on the hearth. Only a few embers remained which cast a doubtful light on his countenance. "Claribell!" he exclaimed, after a long pause, "will you be my wife to-morrow?"—"I am the lady Johanna's servant while she lives," answered Claribell—"and the poor blind boy! what will become of them if I leave my father?"—"They shall remain with us, and we will form one family—we are no longer poor—the traveller gave me this gold, and bade me keep it as your dowry."—Claribell cast her eyes on the heap of rubies, and on her lover's face—"Brande, you have murdered him!"—"With these half articulate words, she fell prostrate on the earth, from which he dared not approach to raise her. But presently gathering the gold, her kinsman placed it at her feet—"Claribell! it is yours! it is his free gift, and I am innocent."—"Follow me, then!" said she, putting the treasure in her bosom; and quitting her father's dwelling, she led the way to Thorsen's. He was awake, reading by the summer moonlight.—"Sir," said Claribell in a firm and calm tone, "your friend deposited this gold in my kinsman's hands—keep it in trust for Adolphus in your own." Brande, surprised, dismayed, yet rescued from immediate danger, acquiesced with downcast eyes; and the pastor, struck only with respectful admiration, received the deposit.

Another year passed, but not without event. A tremendous flood bore away the chief part of the hamlet, and swept off the stock of timber on which the good pastor's saw-mills depended. The hunting season had been unproductive, and the long polar night found Claribell's family almost without provision. Her father's strength yielded to fatigue and grief; and a few dried fish were soon consumed. Wasted to still more extreme debility, her miserable mistress lay beside the hearth, with only enough of life to feel the approach of death. Adolphus warmed her frozen hands in his, and secretly gave her all the rein-deer's milk, which their neighbours, though themselves half famished, bestowed upon him. Brande, encouraged by the despairing father's presence, ventured to remind Claribell of their marriage contract.—"Wait," she replied, with a bitter smile, "till the traveller returns to sanction it." Moody silence followed; while Hans, shaking a tear from his long silver eye-lashes, looked reproachfully at his daughter. "Have mercy on us both," said Brande, with a desperate gesture; "shall an idiot woman and a blind boy rob even your father of your love?"—"They have trusted me," she answered, fixing her keen eyes upon him—"and I will not forsake them in life or death.—Hast thou deserved trust hitherto."

Brande turned away his face and wept. At that terrible instant the door burst open, and three strangers seized him. Already unmanned, he made no resistance; and a caravan sent by judicial authority conveyed the whole family to the hall of the viceroy's deputy. There, heedless of their toilsome journey and exhausted state, the minister of justice began his investigation. A charge of murder had been lodged against Brande, and the clothes worn by the unfortunate traveller, found at the foot of a precipice, red with blood and heaped together, were displayed before him. Still he professed innocence, but with a faltering voice and unsteady eye. Thorsen, strong in benevolence and truth, had followed the prisoner's car on foot, and now presented himself at the tribunal. He produced the gold deposited in his hands, and advanced a thousand proofs of Claribell's innocence, but she maintained herself an obstinate silence. A few silver ducats found in old Hofland's possession implicated him in the guilt of his kinsman; and the judge, comparing the actual evidence of Brande's conduct on the fatal night of the assassination, with his present vague and incoherent statements, sentenced the whole family to imprisonment in the mine of Conings-better?"

Brande heard his decree in mute despair; and Claribell, clinging to her heart-broken father, fixed her eyes, dim with intense agony, on the blind boy, whose face during this ignominious trial had been hidden upon her shoulder. But when the conclusive sentence was pronounced, he raised his head and addressed the audience in a strong and clear tone—"Norwegians! I have no home—I am an orphan and a stranger among you. Claribell has shared her bread with me, and where she goes I will go."—"Be it so," said the judge, after a short pause—"darkness and light are alike to the blind, and he will learn to avoid guilt if he is allowed to witness its punishment."—The servants of justice advanced, expecting their superior's signal to remove the victims, but his eye was suddenly arrested. The Lady Johanna, whose chair had been brought before the tribunal, now rose from it, and stood erect, exclaiming, "I accuse him!" At this awful cry from lips which had never been heard to utter more than the low moan of insanity, the judge shuddered, and his assistants shrunk back as if the dead had spoken. The glare of her pale grey eyes, her spectre-like face shadowed by long and loose hair, were such as a Norwegian sorcerer exhibits. Raising her skeleton hands high above her head, she struck them together with a force which the hall echoed.—"There was but one witness, and I go to him!"—With these words, and a shrill laugh, she fell at the judge's feet, and expired.

Six years glided away; and the rigorous sentence passed on these unfortunate Norwegians had been long executed and forgotten, when the Swedish viceroy visited the silver mines of Cronenburgh. Lighted by a thousand lamps attached to columns of the sparkling ore, he proceeded with his retinue through the principal street of the subterranean city, while the miners exhibited the various processes of their labours. But his eye seemed fixed on a bier followed by an aged man, whose shoulder bore the badge of infamy; leaning on a meagre woman and a boy, whose voice mingled with the rude chant peculiar to Norwegian mourners, like the warbling of an Eolian lute among the moans of a stormy wind. At this touching and unexpected sound, the viceroy stopped and looked earnestly at his guide—"It is the funeral of a convicted murderer," replied the superintendent of the miners; "and that white haired man was his kinsman and supposed accomplice."—"The woman is his widow then?" said the viceroy shuddering—"No, my lord;—her imprisonment was limited to one year, but she chose to remain with her unhappy father, to prepare his food and assist in his labours; that lovely boy never leaves her side, except to sing hymns to the sick miners, who think him an angel come among us."—While the humane intendat spoke, the bier approached, and the torches carried by its bearers shone on the corpse of Brande, whose uncovered countenance retained all the sullen fierceness of his character. The viceroy followed to the grave; and advancing as the body was lowered into it, said, "Peace be with the dead, and with the living. All are forgiven."

The intendat of the mines, instructed by one of the viceroy's retinue, removed the fetters from Hans Hofland's ankles, and placed him with his daughter and the blind boy in the vehicle used to reach the outlet of the mine. A carriage waited to receive them, and they found themselves conveyed from the most hideous subterranean dungeon to the splendid palace of the viceroy. They were led into his cabinet, where he stood alone, not in his rich official robes, but in those he had worn at Dolstein—"It is the traveller!" exclaimed Claribell; and

Adolphus sprang into his arms—"My son!" was all the viceroy could utter as he held him close to his heart.—"Claribell!" he added, after a few moments of agonizing joy, "I am the father of Adolphus, and the Lady Johanna was my wife. Powerful enemies compelled me to conceal even my existence; but a blessed chance enabled me to save my only son, whom I believed safe in the care of the treacherous kinsman who coveted my inheritance, and hoped to destroy us both. Brande was the agent of his guilt; but fearing that his secrecy might fail, the chief traitor availed himself of his power as a judge, to bury his accomplice and innocent victim for ever. Providence saved my life from his machinations, and my sovereign has given me power sufficient to punish and reward. Your base judge is now in the prison to which he condemned your father and yourself—you, Claribell, if you can accept the master of this mansion, are now in your future home. Continue to be the second mother of Adolphus, and ennoble his father by a union with your virtues."—*European Magazine.*

VICIOUS FORMS OF SPEECH AND COMPOSITION.

Few, even of the greatest writers, are so perfectly conversant with the anatomy of the English language, as to be free from occasional improprieties; far less can the mass of the people be expected to avoid such errors in common speech. We think that it is impossible to write or speak too correctly, and it will be allowed that the greater part of the vicious forms of speech and composition might be prevented by a small degree of attention. We therefore submit a few corrections of the more obvious blunders in general use, for the purpose of putting every one on his guard.

Both, whether as a numeral, or as a conjunction, ought to be applied to no more than two objects or sentences.

Whether; a similar remark applies to this word, which in reality is a contraction of "which of the either," that is, which of two objects. *Whether* is too frequently applied to three objects.

Couple, which simply implies the juncture of two objects, cannot properly be used in reference to separate objects. "A couple of shillings," for instance, is an error.

The former and latter can only be used properly in respect of two objects.

Neither (or not either) is only applicable to two objects.

Every, and each, being singular ideas, ought never to be used as plurals. The error of so using them is very common.

Eat is the proper preterite of eat. Eat is now generally used as the preterite—a vulgar mistake, arising from the pronunciation. Sir Walter Scott, who is nearly the most careless writer of the day, and whose writings abound in provincialisms, uses *eat* as the preterite.

Bade is the proper preterite of bid. *Bid* is often used as the preterite, an error similar to that just alluded to.

Lay is the proper preterite of lie. It is also the present of a verb, signifying to deposit. Care ought to be taken not to use it as the present of the former verb, which is often done.

Bidden, ridden, written, spoken, are the past participles of bid, ride, write, speak. We often hear people say, "He was spoke to;" "I have wrote to him;" "Eclipse was rode by Jenkins." Nothing could be more vulgarly erroneous.

Drunk is the proper past participle of drink. Fastidious people have lately got into a way of saying, "His health was drank." Drank is the preterite, and cannot be thus used without a palpable fracture of the skull of Priscian.

Don't, won't, and can't, though admitted as colloquial English, are not good contractions. We could forgive them, however, if people would avoid using *don't* in the third person singular. "He does not" can never be properly abbreviated into "He don't." This error, vulgar as it is, advances a pace in good English society.

Had better, had rather. These are vulgar absurdities, arising, perhaps, from the desire of brevity. "I had rather" must have originally been "I would rather," contracted into "I'd rather." There is a singularly vile Scotticism—"I had oblige to do so and so." It should be I was obliged.

Short-lived, long-lived, should be short-lived, long-lived.

The above, as an adjective. "The above statement may be relied on." Above, being an adverb, can never be correctly used as an adjective. It is, however, very commonly employed in that capacity.

Then, as an adjective. "The then Earl of Winchelsea." Nothing can be more vicious.

A great many, a good many, a few; here a singular article is used with plural nouns. These are very incorrect forms of language.

Quantity is often used in reference to objects susceptible of numeration. It is only applicable to an object capable of increase or decrease, not by numeration.

Differ with, differ to, very bad. *From* is the only correct particle to use with *differ* and its derivatives. *Disagree with* is proper, because *agree* there governs, not the *dis*.

Supported by subscription, which simply means by underwriting, might be improved into "supported by contribution."

Lieutenant. Why should this be pronounced *lef-tenant* 3? Can it be because the *u* in *lieu* was once written *v*? an error similar to that which makes the Mackenysies in Scotland be called Mackenzies, and the name of Menyies be spelt Menzies, the *y* being mistaken by transcribers for *z*.

Beside means *over and above*, and occasionally *except*. To say, "sit beside me," or to use the word in any way as implying place, is incorrect.

Animal. It is generally supposed that this word is only applicable to quadrupeds, as *beast* certainly is. It is in reality applicable to any creature having life and breath.

Without, in the sense of *unless*, is certainly a vulgarism.

Often is decidedly wrong.

Men's minds, the horses' heads. Here the abbreviation of the singular *his* is used or implied for the plural *their*. Nothing can be more incorrect. "The minds of men," and "the heads of the horses," are the proper phrases.

Those sort of things ought to be *this* sort of things.

Progress, as a verb—an Americanism. What fault can be found with the good old English word *advance*?

Man-milliner seems to be both vulgar and wrong. Milliner, from its masculine termination, should certainly be applicable to males; and the word should be altered for the ladies.

Last night, last evening. These are poor substitutes for the fine old English sound of *yesternight*.

Antiquarian is often used for *Antiquary*. The former is the adjective, the latter the noun.

ITALY AND ITS SCENERY.

ITALY is a country more interesting from the historical associations connected with it than almost any other region on the globe, with the exception of Greece. The following vivid description of this beautiful territory is from the poetical pen of Vieuzeux, in his work entitled "Italy and the Italians."

"It is in the southern division that we find the true classical ground of Italy; the land of antiquities, and of mighty recollections; the land of the fine arts. It is chiefly in the south that belong the romantic scenes described by poets and travellers; the beautiful moonlight nights; the glowing azure of the sky; the dark blue sea; the purple tinged mountains; the forests of orange, lemon, and olive trees. There you find men lawless and impassioned; and female beauty,

'Soft as her clime, and sunny as her skies.'

There the landscapes of Salvator Rosa, and the Madonnas of Raphael, had originals in nature. There Pergolesi, Cimarosa, and Paisiello, were inspired. The wonders of Michel Angelo, the Temple of St Peter, as well as the Coliseum and the Pantheon, are there to be found. It is the country of Dante, of Machiavelli, and of Tasso; it was the birth-place of Scipio, of Cæsar, and of Cicero.

The north of Italy is the country of plenty; less poetical, but better cultivated. It has also its recollections of glorious deeds and great men, although of a more recent date and less imposing aspect. It has produced Doria, Titian, Corregio, Ariosto, Alfieri, and Canova. The north has given the best soldiers; the south the keenest politicians. The southern painters excel in the genius of composition, and in the boldness of design; the northern ones, in the delicacy and warmth of tints, and in the softness of outlines. The architecture of the south is colossal and imposing; that of the north is more finished and convenient.

The scenery of the two countries is not less varied. The north is, for the greater part, a fertile plain, watered by abundant rivers, divided into well cultivated fields and gardens; full of towns and villages, inhabited by a numerous and industrious race. The landscape is luxuriant, but monotonous; roads wide, level, and straight, never-ending avenues and trees; the misty glimpse of the distant Alps and Appenines is the only thing that relieves the sleepy dullness of the scene. In the south, on the contrary, the landscape varies every twenty miles. There are to be seen delightful valleys, surrounded by stupendous crags; torrents fearfully swelled at one time of the year, and rolling their foaming waters with the noise of thunder—and at other scenes reduced to scanty rivulets, bubbling over the pebbles of their rocky beds; wide, uncultivated plains, strewn with ruins of former greatness, inhabited by wild buffaloes, and wilder men; and, in the midst of these, the proudest city in the world lifting its melancholy head. Farther inland are seen ruinous castles and towers, perched upon almost inaccessible peaks, among beautiful forests of chestnut trees and wild solitary glens. More to the south, the rich plains of Campania and of Apulia, the lovely shores of Parthenope, encircled by the frowning Appenines, which rise bolder, and higher, and wilder, as they extend farther south; until at last, being narrowly confined between the two seas, they invade the whole breadth of the Peninsula, and heap their dark summits in the province of Calabria. There, at the extremity of Italy, exists a race of men little known to the rest of Europe, and as savage as the inhabitants of the opposite coast of Albania; living in an almost primitive state; full of uncultivated ge-

nus; ignorant, but intelligent; individually courageous, but unruly, ferocious, and impatient of discipline; faithful to their friends, but revengeful to the last against their enemies; capable of the darkest, as well as of the most heroic deeds.

The Italians of the north have less of those peculiar features which mark the fallen descendants of ancient Rome. They resemble more their neighbours, the French, Swiss, and Germans, with whom they have been long in contact, and from whom they have imbibed habits of greater comfort, of artificial luxury, of social discipline. They are of tamer manners; their ideas are more on a level with those of the rest of Europe; they have more the features of a modern nation, and are more likely to form one; they have, in short, the good and the bad qualities of modern civilised Europe.

The Italians of the south (with the exception of Tuscany in some respects) are yet much behind in modern improvements, or modern refinement. They have more characteristic traits of their own to distinguish them from other nations; they have more of the personal independence of half-civilised people, although living under absolute governments: they have stronger passions, but they have also greater enthusiasm for the beautiful, especially in the works of art and music. South Italy is essentially the country of painting and of song.

In the midst of this magic land rise three great cities, the resorts of the traveller—all three beautiful, and famed, although each of them totally different from the other two. Florence, the city of Italian society, Italian urbanity and elegance, and also of polite literature. Rome, the city of monuments, of religious pomp and splendour, and of the arts; the seat also of a certain solemnity and dignity which is more peculiarly her own, and becomes her name and former state. Naples, at last, gay and thoughtless, the city of voluptuousness, the syren of Italy, the spoiled favourite of a too bountiful nature, the seat of epicurism mixed with some degree of Greek refinement, the country of senses, but the country also of imagination."

CHARACTER OF FISH.

It would appear that the character of fish has been generally misrepresented or misunderstood, and Sharon Turner, in his Sacred History, recently published, takes in hand to set us right on the subject. "The general character of fish (says he) is not that of voracity and hostility. It is gentleness, harmlessness, sociality, and animation. They are peaceful animals; happy in themselves, and for the most part harmonising together, without any display of savage cruelty or malignant passions. Such as are appointed to be the food of others, die in that way, and are sought and taken for that purpose when the appetite actuates, but no farther. But they cannot be justly stigmatised as voracious for this habit, more than ourselves for taking and eating them and cattle, sheep, fowls, game, venison, and other living creatures. We are carnivorous, but not voracious. We kill and cook the animals we feed on, but we have no malice, or ill will, or hostility in such action or diet, any more than in plucking the apple, grinding the corn, or boiling the potatoe. It is, therefore, unjust to impute peculiar voracity and destructiveness to these tribes, because some feed on smaller fish, and others on molluscs, worms, and insects that they find. These latter animals appear to be as specially provided for such as use them as slugs and caterpillars are for birds, and grass for cattle; for, at particular seasons, the ocean is made to swarm with them, for no other visible purpose than that the fish may derive nutrition from them. The molluscs, which supply so many of the natives of the sea with their subsistence, are therefore endowed with a power of multiplication, which, as in several other cases, astonishes us by its amount. It is the abundance of these petty invertebrate animals, of various species, so sedulously provided for the nutriment of the fish, which constitutes that luminous appearance, or phosphorescence of the sea, which so often surprises and delights the mariner on his watch in his nightly navigation. If some species of fish are always eating, which is not by any means an authenticated fact, they would but resemble the gaminivorous quadrupeds, which pass the day in browsing and in resting rumination; neither can be fitly branded as voracious in such perpetual mastication; for what animal is milder or more inoffensive than the tranquil though ever-eating cow, who takes 100lbs. of grass in the day? But there are some facts which indicate that the fish have been much misconceived in this respect; and that, however it may be with some particular classes or at particular seasons, the far greater number take less food, and live with pleasure, and apparently from choice, longer without any ascertainable quantity of it, than any other tribes of animals that we know of. The gold and silver fish in our vases seem never to want any food; they are often seen for months without any apparent nourishment. Even the pike, which has been so much branded as a devouring glutton, fattens on total abstinence. The salmon, although it comes in such multitudes from the ocean into the rivers, yet, when opened, is never found to have any nutritive substance in its stomach, an evidence of their taking none in that period of their existence, for herings, when they shoal, are found, on being opened, to have fed largely on the sea caterpillar in their voyage. The lamprey tribe are confessedly small, or no eaters. Many facts of this sort will be recollected by the intelligent naturalist, which will lead him to inquire, whether the great majority of the finny world do not, for the larger part of their existence, content themselves with the nutrition they extract from water alone, without any additional substance. The mild and harmless character of the fish class of being, in its general prevalence, is

impressively exhibited by most of its largest tribes. The great Greenland whale pursues no other animal, leads an inoffensive life, and is harmless in proportion to its strength to do mischief. The massy sturgeon is of the same gentle nature. The formidable narwhal, or sea unicorn, with all its size and powerful weapon of offence, displays the same disposition. The Oro moko manati, which has been found so huge in bulk that 27 men could not draw it out of the water, and the others of this tribe, of which some are twenty-eight feet long, and weigh eight thousand pounds, are likewise gentle and peaceable animals. These mightier chiefs of the finny nation are the true representatives of its general character. All are for the most part the same, mild, playful, animated, and unoffending beings, and have been so designed and organised, habited and stationed, as to be continually of this placid temperament."

THE HYPOCHONDRIAC PRINCE.

Many distinguished persons, from a disease in the imagination, have fallen into strange notions regarding their personal identity and character. In the memoirs of Count de Maurepas, there is an account given of a most singular hypochondriac in the person of the Prince of Bourbon. He once imagined himself to be a hare, and would suffer no bell to be rung in the palace, lest the noise should scare him in the woods. At another time, he fancied himself to be a plant, and as he stood in the garden, insisted on being watered. He some time afterwards imagined he was dead, and refused all nourishment, for which, he said, he had no further occasion. This last whim would have proved fatal, if his friends had not contrived to disguise two persons, who were introduced to him as his grandfather and Marshal Luxembourg, and who, after some conversation concerning the shades, invited him to dine with Marshal Turenne. Our hypochondriac followed them into a cellar prepared for the purpose, where he made a hearty meal. While this turn of his disorder prevailed, he always dined in the cellar with some noble ghost. It is somewhat remarkable that this strange fantasy did not incapacitate him for business, especially where his immediate interests were concerned. Hypochondriasm is doubtless produced, in a great measure, from deep study, or from an artificial mode of living, and a want of proper air and exercise. We seldom hear of a ploughman or an industrious artisan falling into that diseased state of the imagination, and considering themselves hares, vegetables, plants, or disembodied spirits.

THE EARL OF CAITHNESS AND JAMES IV.

Under the vigorous administration of James IV., the young Earl of Caithness incurred the penalty of outlawry and forfeiture, for revenging an ancient feud. On the evening preceding the battle of Flodden, accompanied by three hundred young warriors, arrayed in green, he presented himself before the King, and submitted to his mercy. This mark of attachment was so agreeable to that warlike prince, that he granted an immunity to the Earl and all his followers. The parchment on which this immunity is inscribed is said to be still preserved in the archives of the Earls of Caithness, and is marked with the drum-strings, having been cut out of a drum head, as no other parchment could be found in the army. The Earl and his gallant band perished to a man in the battle of Flodden; since which period, it has been reckoned unlucky in Caithness to wear green, or cross the *Ord* (a huge mountain betwixt Caithness and Sutherland) on a Monday, the day of the week on which the chieftain advanced into Sutherland, on his way towards the south.

ACQUISITION OF KNOWLEDGE.

"I felt the ennobling pride of learning. It is a fine thing to know that which is unknown to others: it is still more dignified to remember that we have gained it by our energies. The struggle after knowledge, too, is full of delight. The intellectual chase, not less than the material one, brings fresh vigour to our pulses, and infinite palpitations of strange and sweet suspense. The idea that is gained with effort affords far greater satisfaction than that which is acquired with dangerous facility. We dwell with more fondness on the perfume of the flower that we have ourselves tended, than on the odour which we cull with carelessness, and cast away with remorse. The strength and sweetness of our knowledge depend upon the impression which it makes upon our own minds. It is the liveliness of the ideas that it affords which renders research so fascinating; so that a trifling fact or deduction, when discovered or worked out by our own brain, affords us infinitely greater pleasure than a more important truth obtained by the exertions of another." "The high poetic talent—as if to prove that a poet is only, at the best, a wild, although beautiful error of nature—the high poetic talent is the rarest in creation."—*Contarini Fleming*.

FIGHT WITH A LION.

A gentleman of our party had a perilous adventure with a lion, he having enjoyed the singular distinction of lying for some moments in the very clutches of the royal quadruped. The main features of the anecdote offered a striking illustration of the sagacity of the elephant, and may be strictly depended upon. A lion had charged my hero's elephant, and he, having wounded him, was in the act of leaning forward in order to fire another shot, when the front of the howdah (or car on the back of the elephant) suddenly gave way, and he was precipitated into the very jaws of the furious beast. The lion, though severely hurt, immediately seized him, and would doubtless shortly have put a fatal termination to the conflict, had not the elephant, urged by the mahout or servant, stepped forward, though greatly alarmed, and, grasping in her trunk the top of a young tree, bent it across the loins of the lion—and thus forced the tortured animal to quit his hold. My friend's life was thus preserved, but his arm was broken in two places, and he was severely clawed on the breast and shoulders. The lion was afterwards slain by the other sportsmen who came up.—*Captain Mundy's Sketches of India*.

NON-BAPTISING OF THE RIGHT HAND.

In the border counties of Scotland it was formerly customary, when any rancorous enmity subsisted between two clans, to leave the right hand of small children unchristened, that it might deal the more deadly, or according to the popular phrase, "unhallowed" blows, to their enemies. By this superstitious rite, they were devoted to bear the family feud, or enmity. The same practice subsisted in Ireland, as appears from the following passage in *Campion's History of Ireland*, published in 1633. "In some corner of the land they used a sinful superstition, leaving the right arms of their infants, males, unchristened (as they termed it), to the end it might give a more ungracious and deadly blow."

THE MINISTER AND THE COLLIER.

A Fife clergyman, of very gentle disposition, one Sunday came upon a pair of Borrowstownness colliers, who had come over the Frith of Forth, and made a piratical descent upon one of his bean-fields. Disposed to take pacific measures with the offenders, the worthy man began to represent to them, in the first place, the sin of thus violating the sanctity of the Sabbath; in the second, the wickedness of destroying so much of his property while in an unripe state, and when it could be of so little service to themselves. "Stay," he entreated, "till the beans are ripe, and, if you will not steal any before that time, I shall willingly give you a whole peck as a sort of reward for your patience and honesty." "A peck!" cried one of the wretches, in a tone of mingled astonishment and scorn; "a peck! gae wa', man, we wadna tak your bow (boll)!"

THE EAGLE AND THE STOAT.

Brown, in his *Anecdotes of Quadrupeds*, relates the following interesting incident in relation to the stoat, a small animal resembling the weasel:—"A group of hay-makers, while busy at their work on Chapelhope meadow, at the upper end of St Mary's Loch (or rather of the Loch of the Lowes, which is separated from it by a narrow neck of land), saw an eagle rising above the steep mountains that enclose the narrow valley. The eagle himself was, indeed, no unusual sight; but there is something so imposing and majestic in the flight of this noble bird, while he soars upwards in spiral circles, that it fascinates the attention of most people. But the spectators were soon aware of something peculiar in the flight of the bird they were observing; he used his wings violently, and the strokes were often repeated, as if he had been alarmed and hurried by unusual agitation; and they noticed, at the same time, that he wheeled in circles that seemed constantly decreasing, while his ascent was proportionably rapid. The now idle hay-makers drew together in close consultation on the singularity of the case, and continued to fix their attention on the seemingly distressed eagle, who rose perpendicularly, until he was nearly out of sight in the concave recess of the blue ether. In a short time, however, they were all convinced that he was again seeking the earth, evidently not as he ascended, in spiral curves; his descent was like something falling, and with great rapidity. As he approached the ground, they plainly perceived that he was tumbling like a shot bird; the convulsive fluttering of his wide and powerful pinions but slightly impeding the rapidity of his descent, until he fell at a small distance from the men and boys of the party, who had naturally run forward, highly excited by the strange occurrence. A large black-tailed stoat ran from the body as they came near, turned with the usual nonchalance and impudence of the tribe, stood up upon its hind legs, crossed its fore paws over its nose, and surveyed its enemies a moment or two (as they frequently do, when no dog is near), and bounded into a willow bush. The king of the air was dead; and, what was more surprising, he was covered with his own blood; and, upon farther examination, they found his throat cut. It was clear that the stoat must have been the regicide."

SINGING.

The American physician, Dr Rush, thus speaks of the utility of singing, not only as an accomplishment, but as a corrective of the too common tendency to pulmonary complaints. "Vocal music," says this celebrated writer, "should never be neglected in the education of a young lady. Besides preparing her to join in that part of public worship which consists in psalmody, it will enable her to soothe the cares of domestic life; and the sorrows that will sometimes intrude into her own bosom may all be relieved by a song, when sound and sentiment unite to act upon the mind. I here introduce a fact which has been suggested to me by my profession, and that is, that the exercise of the organs of the breast by singing contributes very much to defend them from those diseases to which the climate and other causes expose them. The Germans are seldom afflicted with consumptions; nor have I ever known but one instance of spitting blood among them. This, I believe, is in part occasioned by the strength which their lungs acquired by exercising them in vocal music, for this constitutes an essential branch of their education. The music master of our academy has furnished me with an observation still more in favour of this opinion. He informed me that he had known several instances of persons, who were strongly disposed to consumption, who were restored to health by the exercise of their lungs in singing."

Harmonicon.

POOR MAN OF MUTTON.

A leg of mutton, in its last stage of scragginess, is sometimes (in Scotland) devilled, or otherwise prepared for the table, and then bears the familiar title of "a poor man of mutton," or more briefly, "a poor man." It is related by Dr Jamieson, in his Dictionary, that a Scotch nobleman entering an inn in London, after a long journey, and being asked by the landlord what he would please to have, answered with a yawn, "I dare say I could take a bit of a poor man." "A bit of what?" inquired the landlord. "A bit of a poor man," repeated his Lordship. "The Lord have a care of my poor soul!" cried mine host, and made but one step from the top of the stair to the bottom; nor could he be prevailed upon, till the phrase was explained by the nobleman's valet, to make his appearance again in the parlour.

EMIGRATION—PRINCE EDWARD ISLAND.

"WHEN travelling through the settlements of Prince Edward Island (continues Mr Macgregor, in his work on British America), we discover the inhabitants to consist of Englishmen, who, though fewer than any others in numbers, are found from almost every county in England; Scotchmen, who form more than one-half of the population, from the Highlands, Hebrides, and the southern counties; American loyalists; and a few Dutch, Germans, and Swedes. The whole population may be estimated at 35,000. The English settlers, although for some time discontented with their condition, are generally found to thrive, particularly those from Yorkshire; and they are much more attentive to in-door comfort and cleanliness than most other settlers."

The Highland Scotch, particularly those who settled first in the colony, and their descendants, are exceedingly regardless of domestic cleanliness or neatness, while they are at the same time in much better circumstances than they would be in their native country. The Lowland Scotch make probably the best settlers, at least those who have, during late years, removed to the island, may be considered so; and the Perthshire Highlanders, as well as those sent to the colony by the late Earl of Selkirk, may also be classed among the most thriving part of the population. The American loyalists, who removed to the island after the revolutionary war, are generally most industrious in their occupations. They live very comfortably, and are extremely ingenious, building their own houses, are carpenters and joiners, make their own shoes, ploughs, harrows, carts, sledges, cabrioles, &c. The women spin, knit, and weave linens, cottons, and woollen cloth for domestic use. The Irish emigrants soon better their condition in this colony; but they are certainly a less steady class of settlers than any other. There are about 5000 Acadian or Nova Scotian French on the island, and these profess the Roman Catholic religion. Their priests are educated in Canada. The Indians, who wander about the colony, are now few in number.

The inhabitants of the colony, particularly the old farmers, are hospitable, kind, and obliging, and, generally speaking, a moral people. Litigation, which the timber business, and the credit given by the tavern-keepers and small shopkeepers, have produced, and the low price of rum, form the sole causes of immorality, and the most baneful evils connected with the island. The farmers are employed, during the winter, in attending to their cattle, thrashing out their corn, cutting and hauling home fire-wood for winter use, and a stock of fuel for summer; these occupations, with many other little matters connected with his farm, house, and markets, engage the constant attention of a managing industrious man. The farmers' wives and daughters are generally very industrious, decorous, and correct, and strictly domestic and attentive to household duties. They assist in the labours of the farm during seed-time, hay-making, and harvest, and, during winter, prepare their flax and wool for spinning and knitting, and many of them also weave their home-spun cloth. The different denominations of religion that have places of worship, are the Church of England, as established by law, the Kirk of Scotland, Scottish Dissenters, Roman Catholics, Methodists, and Baptists. All the members of these professions associate together as neighbours, and frequently attend the places of worship of each other with great good feeling. There is in Charlotte Town a very respectable grammar-school, a school on the Madras system, and schools in most of the settlements for elementary instruction. The Legislative Assembly vote money for the partial support of these schools. The island is governed by a lieutenant-governor, a council, and a House of Assembly of eighteen representatives, elected by the people.

As to the prospects which this colony may present to persons in the United Kingdom who are desirous of emigrating, not more than 20,000 acres, if so much, are held by the crown. Woodlands in convenient situations may, however, be purchased for from 10s. to L.2 per acre; and leases, in perpetuity, or, what amounts to the same thing, for 999 years, can be obtained for the annual rent of from 1s. to 2s. per acre, and in some situations for less. So that, taking into consideration the advantages of residing in the vicinity of well-disposed society, the opportunity that is afforded of having children instructed in the rudiments of education, of roads communicating between all the settlements, of corn-mills and saw-mills being almost every where in the neighbourhood, and having the convenience and benefit, by living near the shipping ports, of ready markets for the produce of the land or sea, it may be reasonably concluded, that the terms on which lands are now to be had in this island are much more favourable than those on which they can be had in the United States.

It is curious and interesting to observe the progress which a new settler makes in clearing and cultivating a wood farm, from the period he commences in the forest, until he has reclaimed a sufficient quantity of land to enable him to follow the mode of cultivation he practised in his native country. As the same course is, with little variation, followed by all new settlers in every part of America, the following description may, to avoid repetition, be considered applicable to all the British American settlements.—The first object is to select the farm among such vacant lands as are most

desirable, and after obtaining the necessary tenure, the settler commences, usually assisted in his first operations by the nearest inhabitants, by cutting down the trees on the site of his intended habitation, and those growing on the ground immediately adjoining. This operation is performed with the axe, by cutting a notch on each side of the tree, about two feet above the ground, and rather more than half through on the side it is intended the tree should fall on. The lower edges of these notches are cut horizontally, the upper making an angle of about 60° with the ground. The trees are all felled in the same direction, and after lopping off the principal branches, cut into ten or twelve feet lengths. On the spot on which the house is to be erected, theseunks are rolled away, and the smaller parts cleared off, or burnt. The habitations which the new settlers first erect are all nearly in the same style, and in imitation of, or altogether like, the dwellings of an American back-woodsman, constructed in the rudest manner. Round logs, from fifteen to twenty feet long, without the least dressing, are laid horizontally over each other, and notched in at the corners to allow them to come along the walls, within about an inch of each other. One is first laid on each side to begin the walls, then one at each end, and the building is raised in this manner, by a succession of logs crossing and binding each other at the corners, until the wall is six or seven feet high. The seams are closed with moss or clay; three or four rafters are then raised to support the roof, which is covered with boards, or more frequently with the rinds of birch or fir-trees, and thatched with spruce branches, or, if near the sea coast, with a long marine grass, which is found in quantities along the shores. Poles are laid over this thatch, tied together with birch withes, to keep the whole securely down. A wooden frame-work, placed on a slight foundation of stone roughly raised a few feet above the ground, lends through the roof, which, with its sides closed up with clay and straw kneaded together, forms the chimney. A space large enough for a door, and another for a window, is cut through the walls; and in the centre of the cottage a square pit or cellar is dug for the purpose of preserving potatoes or other vegetables during winter; over this pit a floor of boards, or logs hewed flat on the upper side, is laid, and another over head, to form a sort of garret. When the door is hung, a window-sash, with six or nine, or sometimes twelve panes of glass, is fixed, and one, two, or three trundle beds are put up; the habitation is then considered ready to receive the new settler and his family. Although such a dwelling has certainly nothing handsome, comfortable, or even attractive, unless it be its rudeness in appearance, yet it is by no means so miserable a lodging as the habitations of the poorer peasantry in Ireland, and in some parts of England and Scotland. In a few years, however, a much better house is built, with two or more rooms, by all industrious settlers. Previous to commencing the cultivation of woodlands, the trees that are cut down, lopped, and cut into lengths, are, when the proper season arrives, generally in May, set on fire, which consumes all the branches and small wood. The logs are then either piled in heaps and burnt, or rolled away for fencing. Those who can afford the expense, use oxen to haul off the large unconsumed timber. The surface of the ground, and the remaining wood, is all black and charred; working on it, and preparing it for the seed, is as disagreeable probably as any labour in which a man can be engaged. Men, women, and children, however, must employ themselves in gathering and burning the rubbish, and in such parts of labour as the strength of each adapts them to. If the ground be intended for grain, it is sown without tillage over the surface, and the seed covered with a hoe. By some a triangular harrow is used in place of the hoe, to shorten labour. Others break up the earth with a one-handed plough (the old Dutch plough), which has the share and coulter locked into each other, drawn also by oxen, while a man attends with an axe to cut the roots in its way. Little regard is paid in this case to making straight furrows, the object being no more than to work up the ground. With such rude preparation, however, three successive good crops are raised without any manure. Potatoes are planted in round hollows, scooped four or five inches deep, and about twenty in circumference, in which three or five sets are planted, and covered over with a hoe. Indian corn, cucumbers, pumpkins, pease, and beans, are cultivated in new lands in the same manner as potatoes. Grain of all kinds, turnip, hemp, flax, and grass seeds, are sown over the surface, and covered by means of a hoe, rake, or harrow. Wheat is generally sown on the same ground, the year after potatoes, without ploughing, but covering the seed with a rake or harrow, and oats are sown on the same land the following year.

Some farmers—and it is certainly a prudent plan—sow timothy, or clover seed, the second year, along with the wheat, and afterwards let the ground remain under grass until the stumps of the trees can be easily got out, which usually requires three or four years. With a little additional labour, these obstructions to cultivation might be removed the second year. The roots of spruce, birch, and beech, decay soonest; those of pine and hemlock scarcely decay in an age. After the stumps are removed from the soil, and those natural hillocks called cradle hills, which render the whole

of the forests of America full of inequalities of from one to three feet high, are levelled, the plough may always be used, and the system of husbandry followed that is most approved of in England or Scotland. When the soil is exhausted by cropping, which, on alluvial lands, is scarcely ever the case, various manures may be procured and applied. In many parts of America, limestone, gypsum, &c. are abundant, but little less except stable dung is ever used. Composts are rarely known; and different manures, that would fertilize the soil, are so much disregarded, that, generally speaking, the cultivation of the soil is conducted in so slovenly a manner, that it appears astonishing how many of the settlers raise enough to support their families. In this island, within many of the bays and rivers, numerous banks of mussel-mud abound, which consists of mussels, shells, and mud, composed of decayed vegetable and other substances. This forms an extremely rich manure, containing about forty-five parts of the carbonate of lime, and imparts extraordinary fertility for ten or twelve years to the soil. Sea weed, or ware which is thrown on the shores, especially on the north side of the island, in great quantities, is another excellent manure, particularly for barley crops; and even the common mud which abounds in the creeks may be applied as a manure with advantage."

ENGLISH ODDITIES.

THE peculiar and odd practices of the English have been frequently satirised, and to make the satire itself an instance of oddity, it has been as often levelled by the English themselves, as by foreign writers. Goldsmith manifested a strong perception of what was ridiculous in our manners when he wrote his *Citizen of the World*; and a similar faculty has been shewn by Southey, in his *Letters of Esplanade*, from which the following passage may be quoted:—

"Yesterday I went to see a show of tulips, as it is called, about three miles from town. The bed in which they were arranged, each in its separate pot, was not less than fifty *varas* in length, covered with a linen awning the whole way, and with linen curtains at the sides, to be let down, if the wind should be violent, or the rain beat in. The first sight of this long gallery of flowers was singular and striking; and faint as the odour of the tulip is, the many thousands which were here collected together formed a very perceptible and sweet fragrance. The few persons present were brother florists, or amateurs of the science, and the exhibitor himself was a character quite new to me. Never before had I seen such perfect and complete enjoyment as this man took in his tulips; he did not seem to have a single wish, or thought, or idea beyond them; his whole business from one end of the year to the other was to nurse them up, and here they were in full bloom and beauty. The price of one, he told us, was twenty guineas; another only ten; some were forty, fifty, as high as a hundred; there was one on which no price could be set. . . he did not know its value, . . indeed it was invaluable. We saw Julius Caesar, and the Great Mogul, and Bonaparte, and St George, and the Duke of Marlborough. "This," said he, "is poor Louis XVI.;—here's Pompey; . . that's Washington; he's a grand fellow;" and he looked up in our faces with a feeling so simple, and so serious, that it was evident his praise was solely designed for the flower. I ventured to admire one, and, as you may suppose, only betrayed my ignorance; it was a vulgar flower, and had no name; they told me it was *streaky*, by which term they meant that it was veined with colours which spread into the white part of the leaf, and faded away; . . the very thing for which I had admired it. It seems, the perfection of a tulip consists in its form; the lips of the cup should just incline inwards, and just be tipped with a colour which does not diffuse itself. When I knew that standard of perfection, I began to see with the eyes of a connoisseur, and certainly discovered beauties which would never have been perceptible to me in my state of ignorance.

He and his man, he told us, sat up alternately to watch the garden; yet, notwithstanding their vigilance, some thieves had got in a few nights before: . . "The fools!" said he, "they took about fifty yards of the cloth before they were disturbed, but never touched one of the tulips." His man appeared to be as devoutly attached to the pursuit as himself. I never saw such complete happiness as both these men felt in beholding the perfections of their year's labour, such sober and deep delight as was manifest in every word and gesture. . . Never let me be told again that the pursuit of happiness is vain.

The tulip mania of the Dutch never raged in England, whatever you might imagine from this specimen; yet I have heard of one old gentleman who never was half a dozen leagues from his birth-place during his whole life, except once, when he went to Holland to purchase roots. There may be amateurs enough to make it not an expensive pursuit for the florist; and perhaps the number of persons, who, like us, give a shilling to see the exhibition, may be sufficient to pay for the awning; but I should think it can never be pursued for profit. The carnation, the ranunculus, and the auricula, have each their devotees, who have meetings to exhibit their choice specimens, and prizes for the most beautiful. These bring those flowers to a wonderful perfection, yet this perfection

is less wonderful than the pains by which it is procured. Akin to the florists are the Columbarians, or pigeon-fanciers, and the butterfly-breeders or Aurelians. . . Even as any thing may become the object of superstition, an onion or a crocodile, an ape or an ape's tooth, so also any thing does for a pursuit.

There is, perhaps, no country in which the passion for collecting rarities is so prevalent as in England. The wealth of the kingdom, the rapidity with which intelligence is circulated, and the facility with which things are conveyed from one end of the island to the other, are instrumental causes; but the main cause must be the oddity of the people themselves. There is a popular notion which has originated, Heaven knows how, that a Queen Ann's farthing (the smallest coin they have) is worth £500; and some little while ago, an advertisement appeared in the newspapers offering one for sale at this price. This at once excited the hopes of every body who possessed one of these coins, for there are really so many in existence that the fictitious value is little or nothing. Other farthings were speedily announced to be sold by private contract—go where you would, this was the topic of conversation.

The passion for old china is confined to old women, and indeed is almost extinct. Medals are in less request since science has become fashionable; or perhaps the pursuit is too expensive; or it requires more knowledge than can be acquired easily enough by those who wish for the reputation of knowledge without the trouble of acquiring it. Minerals are now the most common objects of pursuit; engraved portraits form another, since a clergyman some forty years ago published a biographical account of all persons whose likenesses had been engraved in England. This is a mischievous taste, for you rarely or never meet an old book here with the author's head in it; all are mutilated by the collectors: and I have heard that still more mischievous collections of engraved title-pages have been begun. The book-collectors are of a higher order, . . not that their pursuit necessarily implies knowledge; it is the love of possessing rarities, or the pleasure of pursuit, which in most cases actuates them; . . one person who had spent many years in collecting large paper copies, having obtained nearly all which had ever been thus printed, sold the whole collection for the sake of beginning to collect them again. I shall bring home an English bookseller's catalogue as a curiosity; every thing is specified that can tempt these curious purchasers: the name of the printer, if he be at all famous; even the binder, for in this art they certainly are unrivalled. The size of the margin is of great importance. I could not conceive what was meant by a *tall copy*, till this was explained to me. If the leaves of an old book have never been cut smooth, its value is greatly enhanced; but if it should happen that they have never been cut open, the copy becomes inestimable.

The good which these collectors do is, that they preserve volumes which would otherwise perish; and this out-balances the evil which they have done in increasing the price of old books ten and twenty fold. One person will collect English poetry, another Italian, a third classics, a fourth romances: for the wiser sort go upon the maxim of having something of every thing, and every thing of something. They are in general sufficiently liberal in permitting men of letters to make use of their collections; which are not only more complete in their kind than could be found in the public libraries of England, but are more particularly useful in a country where the public libraries are rendered almost useless by absurd restrictions and bad management.

The species of minor collectors are very numerous. Some ten years ago many tradesmen issued copper money of their own, which they called tokens, and which bore the arms of their respective towns, or their own heads, or any device which pleased them. How worthless these pieces must in general have been you may judge, when I tell you that their current value was less than two *quartos*. They became very numerous; and as soon as it was difficult to form a complete collection, . . for while it was easy nobody thought it worth while, . . the collectors began the pursuit. The very worst soon became the most valuable, precisely because no person had ever preserved them for their beauty. Will you believe me when I tell you that a series of engravings of these worthless coins was actually begun, and that a cabinet of them sold for not less than fifty pieces of eight? When the last new copper currency was issued, a shopkeeper in the country sent for a hundred pounds worth from the mint, on purpose that he might choose out a good specimen for himself. Some few geniuses have struck out paths for themselves; one admits no work into his library if it extends beyond a single volume; one is employed in collecting play-bills, another in collecting tea-pots, another in hunting for visiting-cards, another in forming a list of remarkable surnames, another more amusingly in getting specimens of every kind of wig that has been worn within the memory of man. But the King of Collectors is a gentleman in one of the provinces, who, with great pains and expense, procures the halsters which have been used at executions; these he arranges round his museum in chronological order, labelling each with the name of the criminal to whom it belonged, the history of his offence, and the time and place of his execution. In the true spirit of

virtue, he ought to hang himself, and leave his own halter to complete the collection.

You will not wonder if mean vices should sometimes be found connected with such mean pursuits. At the sale of a virtuoso's effects, a single shell was purchased at a very high price; the buyer held it up to the company; "There are but two specimens of this shell," said he, "known to be in existence, and I have the other;" . . and he set his foot upon it and crushed it to pieces."

YARROW VISITED.

Written in September 1814. By WILLIAM WORDSWORTH.

And is this Yarrow? This the stream
Of which my fancy cherish'd,
So faithfully a waking dream?
An image that hath perished!
O that some minstrel's harp were near,
To utter notes of gladness,
And chase this silence from the air,
That fills my heart with sadness.

Yet why?—a silvery current flows
With uncontrolled meanderings;
Nor have these eyes by greener hills
Been soothed, in all my wanderings.
And, through her depths, Saint Mary's Lake
Is visibly delighted;
For not a feature of those hills
Is in the mirror slighted.

A blue sky bends on Yarrow vale,
Save where that pearly whiteness
Is round the rising sun diffused,
A tender hazy brightness;
Mild dawn of promise! that excludes
All fruitless dejection;
Though not unwilling here to admit
A pensive recollection.

Where was it that the famous flower
Of Yarrow vale lay bleeding?
His bed, perchance, was yon smooth mound
On which the herd is feeding;
And haply from this crystal pool,
Now peaceful as the morning,
The water-wraith ascended thrice—
And gave his doleful warning.

Delicious is the lay that sings
The haunts of happy lovers,
The path that leads them to the grove,
The leafy grove that covers:
And pity sanctifies the verse
That paints, by strength of sorrow,
The unconquerable strength of love;
Bear witness, rueful Yarrow!

But thou, that did'st appear so fair
To fond imagination,
Dost rival in the light of day
Her delicate creation:
Meek loveliness is round thee spread,
A softness still and holy;
The grace of forest charms decayed,
And pastoral melancholy.

That region left, the vale unfolds
Rich groves of lofty stature,
With Yarrow winding through the pomp
Of cultivated nature;
And, rising from those lofty groves,
Behold a ruin hoary!
The shattered front of Newark's Towers,
Renowned in border story.

Fair scenes for childhood's opening bloom,
For sportive youth to stray in;
For manhood to enjoy his strength;
And age to wear away in!
Yon cottage seems a bower of bliss:
It promises protection
To all the nestling brood of thoughts
Sustained by chaste affection!

How sweet on this autumnal day,
The wild wood's fruits to gather,
And on thy true-love's forehead plant
A crest of blooming heather!
And what if I enwreath my own!
'Twere no offence to reason;
The sober hills thus deck their brows
To meet the wintry season.

I see—but not by sight alone,
Lov'd Yarrow, have I won thee;
A ray of fancy still survives—
Her sunshine plays upon thee!
Thy ever-youthful waters keep
A course of lively pleasure;
And glad some notes my lips can breathe,
According to the measure.

The vapours linger round the heights;
They melt—and soon must vanish;
One hour is theirs, nor more is mine—
Sad thought! which I would banish,
But that I know, where'er I go,
Thy genuine image, Yarrow!
Will dwell with me, to lighten joy,
And cheer my mind in sorrow

A HIGHLANDMAN'S ANSWER.

A gentleman from the Highlands of Scotland, attended by his trusty servant Donald, a native of the wild and mountainous district of Lochaber in Inverness-shire, when travelling through the fertile and delightful plains of Italy, asked Donald what he would do if he possessed an estate there? Donald instantly replied, "Please your honour, I would sell him, and buy an estate in Lochaber!"

Column for Rural Economists.

THE GOLDEN PIPPIN.

The golden pippin, one of the most celebrated and esteemed apples of this or perhaps any other country, has been considered by some of our modern writers on pomology to be in a state of decay, its fruit of inferior quality in comparison to that of former times, and its existence near its termination. I cannot for a moment agree with such an opinion, because we have facts annually before our eyes completely at variance with such an assertion. Any person visiting Covent Garden or the Borough markets during the fruit season, and indeed any other large market in the southern or mid-land counties of England, will find specimens of fruit as perfect and as fine as any which have been either figured or described by any writer whatever, either in this or any other country. In favourable situations, in many parts of the country, instead of the trees being in a state of rapid decay, they may be found of unusually large size, perfectly healthy, and their crops abundant; the fruit perfect in form, beautiful in colour, and excellent in quality. If the golden pippin be planted upon a good soil, on a dry bottom, and in a warm or sheltered situation, well exposed to the sun, where its blossoms are secured from cold blasts in the spring, and where it can ripen its wood perfectly, it will be found hardy, without exhibiting those alarming signs of decay which have been held out as a presage of its speedy death.—*Lindley's Guide to the Orchard and Kitchen Garden.*

PROPAGATING PLANTS.

The propagation of plants is effected by the arts of increasing by eyes, striking from cuttings, laying, budding, and grafting. Increasing by eyes is the simplest of all these methods; it consists in nothing but extracting a single system of life, or a bud from a given plant, placing it in due heat and moisture, and surrounding it with fitting food; and thus causing it to grow as a solitary individual, instead of as one of the community to which it originally belonged. Striking from cuttings is a slight modification of the last method. Instead of taking a single bud, a stem containing two, three, or more buds, is placed in circumstances fitted for the maintenance of its life. In this case, the chances of success are increased by the additional number of buds which are the subject of experiment. That bud which is nearest the bottom of the cutting emits its roots at once into the earth, and so establishes a communication between the general system of the cutting and the medium from which its food is to be derived ultimately; the roots of all the buds descend between the bark and the wood, until they reach the earth, into which they finally pass, like those of the first bud. Laying is nothing but striking from cuttings that are still allowed to maintain their connection with the mother plant by means of a portion at least of their stem. Budding and grafting are operations that equally depend for their success upon the property that buds possess of shooting roots downward and stems upward; but in these practices the roots strike between the bark and the wood of the stock, instead of into the earth, and form new layers of wood instead of subterranean fibres. The success of such practices, however, depends upon other causes than those which influence the growth of cuttings. It is necessary that an adhesion should take place between the scion and the stock, so that when the descending fibres of the buds shall have fixed themselves upon the wood of the stock, they may not be liable to subsequent separation. No one can have studied the economy of the vegetable kingdom without having remarked that there is a strong tendency to cohesion in bodies or parts that are placed in contact with each other. This cohesion will be always found to take place in the cellular tissue only, and never in the vascular tissue. In the stems of all such trees as are grafted by orchardists, the cellular tissue is found alive only in the medullary rays and the liber; it is therefore essential, in the first place, that those parts, both in the stock and the scion, should be placed in contact. In regard to the medullary rays, these are so numerous and so closely placed that it is scarcely possible that a portion of one stem should be applied to another, without the medullary rays of both touching each other at many points. In regard to the liber, as this is confined to a narrow strip in both stock and scion, great care must be taken that they are both placed as exactly in contact with each other as possible, so that the line of separation of the wood and bark should, in both stock and scion, be accurately adjusted. The success of grafting depends very much in attention to this.—*Ibid.*

INVERTING TREES.

In the course of ascertaining how far a circulation of sap is carried on in trees, some interesting facts have been determined by Mr Knight and others with regard to the effect of inverting stems, or, in other words, of planting the superior part of the stem, and thus converting it into a root. If the stem of a plum or cherry tree, which is not too thick, be bent, and the top be put under ground, while the roots are gradually detached, in proportion as the former top of the stem becomes firmly fixed in the soil, the branches of the root will shoot forth leaves and flowers, and in due time will produce fruit.

GERMINATION OF SEEDS.

Oxalid acid has been successfully used to make old seeds germinate. They are put into a bottle of the acid until germination commences, which is generally in from twenty-four to forty-eight hours, when they are taken out and sown in the usual manner. Seeds from twenty to forty years old have been successfully treated in this way.

TO PRODUCE GRASSY LAWNS.

In the metropolis and its neighbourhood, the turf laid down in small gardens seldom lasts more than one season, and requires to be renewed at an expense, including the purchase of the turf and laying it down, of from 3d. to 4d. a square foot. Instead of being at this expense, if the ground to be turned were to be stirred up to the depth of three or four inches every spring, in the last week of March or the first week of April, and thickly sown with the following seeds, it would soon become green, and, if regularly sown, will remain as close and thick as any turf whatever during the whole summer; dying, however, in the succeeding winter, and requiring to be renewed in the spring. The grasses used for this purpose are: *Agrostis vulgaris* var. *tenerifolia*, *Festuca duriuscula*, *Festuca ovina*, *Cynosurus aristatus*, *Poa pratensis*, *Avena flavescens*, and *Trifolium minus*. These seeds are mixed together in equal portions, and are sown at the rate of from four to six bushels per acre. In lawns and shrubberies in the country, the turf frequently falls under large trees and in various other places. There is no cheaper or better mode of making good these defects than by sowing the above mixture so early every spring as the situation and the soil will admit.—*Gardener's Magazine.*

PLANTING POTATOES WHOLE.

A correspondent of the "Gardener's Magazine," writing upon the above question, recommends that potatoes should be planted whole, and adds—"As a testimony, I will state an experiment of mine in 1828. I planted four plants, containing two eyes to each; four, the crowns containing, perhaps, five or six eyes each; four small potatoes; four large whole ones (or what are termed ware potatoes.) Now for the weight of the produce of each kind: the produce of the first four roots weighed 8lbs., that of the second four, 11lbs., that of the third four, 15lbs., that of the fourth four, 16lbs. I think this will make clear to any one, that the reverse of what is generally followed ought to be practised, viz. to plant crowns, or whole potatoes, in lieu of a plant with two eyes. This is even the second trial I have made, and found it the same; but was not so particular in the first experiment as in the second, having determined by my eye the difference was so obvious. I think this of the greatest importance to the agriculturist. If it hold good for an acre, what a difference in the produce! The object of a little extra seed bears no comparison to the produce; and, beside, the labour of cutting is saved. The "Journal Etanger" gives the following economical mode of procuring early potatoes:—Towards the end of February or the beginning of March, prepare a bed of fresh manure; cover it with sand, or very light earth, to the depth of about two or three inches; when the bed shall have become heated, cover the whole of its surface with peelings of potatoes, cut thicker than when the root is intended for culinary use. Place the peelings with the skin upwards, and all in contact; cover them with light earth, from two or three inches deep. This hot-bed is to be treated in the same way as others destined for forcing early crops: viz.—to be covered with matting, exposed at proper hours to the air and sun, and to be frequently watered. Vegetation will thus quickly proceed.

BURNING WIDOWS IN INDIA.

"SINCE I left Bengal (says Statham, in his Recollections of India), the horrible practice of burning widows with the dead bodies of their husbands, called suttee, has been abolished by an order of government; and I can truly say, no intelligence was ever so grateful to me than the news of so praiseworthy an act on the part of Lord William Bentinck, who has gained more laurels by this order than any of his predecessors have done by splendid victories or advantageous political treaties. Never shall I forget the awful shrieks of expiring widows, which, in many instances, have met my ear. Sometimes I have beheld the poor aged matron, unable to ascend the pile, thrown upon it by the hard-hearted Brahmins, with as little remorse as they would have felt if they had been throwing up a log of wood, and with the same roughness too; whilst, at other times, I have beheld the youthful victim of superstition and Brahminical cupidity eagerly and fearlessly ascend the funeral pile of her deceased husband, and embrace the putrid remains, quietly submitting to be bound with flax, and to have a load of dry wood placed over her, till at length the fatal torch being applied by the next of kin, the swiftly-spreading flames have dispelled her dreams of fancied bliss. The last suttee I witnessed was attended with most distressing circumstances: the widow was young, and the mother of three children, two boys and a girl.

It was about seven o'clock in the morning of one of the hottest days of July, that I heard of the death of a man, and of the determination of the widow to become a suttee. I immediately went to the house, but was refused admittance. I returned home, but went again in a short time, and then found the body of the deceased husband before the dwelling-house, and the widow sitting by it. She had taken the cloth from her own shoulders and spread it over the face of her husband, so that she was naked from the waist upwards. In her hand she held the branch of a sacred tree, with which she brushed off the flies from the dead body beside her. I immediately reasoned with her on the sin and folly of her proposed self-destruction, pointing out the sinful nature of the crime, and in forsaking the duties incumbent on a mother, as well as the excruciating pains she must endure if she persevered in mounting the funeral pile. To all entreaties to desist from her purpose, she constantly answered, "I am a suttee, a holy woman." When I asked her what she hoped to obtain by this act of self-destruction, she said, "Two millions of years of happy lives (or transmigrations) for myself and husband too." This declaration was eagerly caught at by the host of Brahmins around, who, with clamorous tongues, assured her this would be the case, at the same time advising her to answer none of my questions. This advice for some time she strictly adhered to; and when I spoke to her, instead of answering, she would frantically shout, "Hurrubhoil, hurrubhoil!" However, after reasoning with the Brahmins, and patiently and perseveringly putting questions to her, she at length returned answers to them; and I found that her mind was most fully bent on undergoing the fiery ordeal. She was the most interesting native female, in appearance, that I ever saw, and evinced a courage all through the awful scene that I seldom remember to have seen equalled. In consequence of the judge humanely desiring to prevent her burning, the perwhanna, or order, was not signed for two days, during the whole of which time she was obliged to remain without food, except a few grains of dried rice, presented by the officiating Brahmin; neither could she leave the dead body of her husband, which, long before the ceremony of burning took place, was become so putrid, that the Brahmins, who delighted in the cruel work, were obliged to keep at a good distance from it; yet the poor woman sat beside the corpse, fanning away the flies the whole time, and now and then addressing some endearing words to it. A great deal of impatience was manifested on the second day by all parties for the arrival of the perwhanna; and the brother of the deceased set out for Allipore, a distance of four miles, to expedite the business. Through the haste and anxiety of this messenger, he brought away the order without the signature of the judge. What was now to be done, puzzled them all. The relatives wished to burn the bodies, but this the Daroga forbade.

It was too late now to wait on the judge that day, as the offices were closed. Some advised that the dead body should be burned, and the woman on the same spot the next day; but the relatives said, if the body was once burnt, the woman's resolve might fail, so that it was determined to postpone the burning till the morrow.

Thinking, under the distressing circumstances in which she was now placed, another effort might succeed, I called her two little boys, who were sitting at a distance, to me, and taking one in each hand, went up to her, saying, "Can you, then, thus leave your children without a protector? Have you no maternal feelings left? Can you forsake the children to whom you have given birth? Remember how you have nursed and cherished them, and do not act so cruel, so unnatural a part, towards them." Leaping upon her feet, and lifting her hands to heaven, she exclaimed, "They are not my children; I am a suttee—a holy woman. I have no children. Take them away—take them away." The little boys, evidently in great distress of mind, fell at my feet, and, embracing my knees, exclaimed, "Sahib, our father is dead, and if mother dies, what will become of us? Don't let her burn—don't let her burn, sahib." Whilst thus supplicating, an old man, who, I afterwards learned, was their father's uncle, rushing forward, caught hold of each by the hair of the head, and, dragging them from me, constrained them to shout, Hurrubhoil! It was a lamentable sight to behold them, with tears rolling down their cheeks, thus employed.

Early the next morning I approached the fatal spot again. All nature seemed hushed in silence; a refreshing dew had invigorated the herbs and trees, and a gentle breeze played on the surface of the river. Several large vultures were perched on the summit of the tree, beneath which the devoted victim sat, whilst several large Pariah dogs were prowling around, all attracted by the noisome effluvia issuing from the putrid corpse. The appearance of the woman was greatly altered for the worse. She seemed to be quite intoxicated; her eyes rolled, and her manner altogether was quite different from what it was on the preceding day. Her long dishevelled hair floated in the breeze, and she reminded me of the fabled Hecate. In the course of the night she had been allowed some bhang, which produces the same effect as opium, and is very much liked by the natives generally.

To reason with her in this state was impossible. About eleven o'clock the brother returned with the perwhanna, duly signed by the magistrate. The pile was soon in readiness; it was about seven feet long and five feet broad, and raised about five feet from the ground, composed of dry billets laid across each other, and kept in place by strong stakes driven into the ground; the interstices were filled with flax and shavings dipped in oil, and two large bands of flax were laid across the pile. As she walked boldly towards it, I attempted to gain her attention once more; but the Brahmins were become very insulting and violent. Having proceeded seven times round the pile, during which time she had given parched rice and several little ornaments to her surrounding relatives and friends, she boldly clambered up, and frantically cast herself upon the putrid corpse already deposited there. The two bands of flax were immediately drawn tightly round both the bodies, and tied fast together; many large dry billets were then piled upon them to a great height, and flax was cast in between every layer; then over the whole a kind of liquid butter was poured in abundance; and lest the poor victim should, on feeling the fire, make her escape, two large bamboos were fixed in the ground, on one side of the pile, and, being bent over, were held down tightly by men on the other side, so that the escape of the woman was rendered impossible. Soon as this was completed, which was done in a very short time, a light was placed in the hand of the eldest child, and this poor suppliant for his mother's life was constrained to walk round the pile seven times, and then to set light to some flax beneath the heads of his dead father and living mother. The pile was instantly in a blaze, and the noise of the tomtoms and screams of the multitude quite drowned the cries of the poor widow, except to those who were close to the pile. But I heard a scream from that fire which I shall never forget! It was a cry of horrible anguish and entreaty for liberation! But in a few minutes the cry ceased, and, shortly after, nothing but a heap of burning embers was seen on the spot."

DRESS OF THE HAMBURGERS.

The dress of the men in Hamburg differs in no perceptible degree from our own. Some of the trades, however, have peculiar garbs; for instance, carpenters go about in cocked hats and leather aprons; while bakers are characterised by black waistcoats, and waiters at hotels by green aprons. The costume of the women of the lower orders is like that of some of the cantons of Switzerland. The straw hat is in the shape of a plate; the concave surface being applied to the head. A petticoat of coarse blue cloth depends from a dirty jacket without sleeves, and shoes with wooden bottoms and leather tops complete the grotesque figure. Unmarried women wear the hair braided into two tails, like those of China-men, hanging down their backs, and nearly touching the ground. Married women cut off one of these curious appendages; if they marry a second time, the other is amputated, and the whole hair concealed. It is singular that Tacitus, speaking of the ancestors of the Hamburgers—for such the Suevi probably were—remarks a peculiarity in their mode of dressing the hair. He observes that they braided and tied it up in a knot; and that they were thus distinguished from the rest of the Germans; while their slaves, like those of the neighbouring people, were kept shaven or close cropped. He adds that some of the other Germans braided their hair though only in youth; but the Suevi continued to do so even in old age; and their chiefs tied it in a knot on the top of the head (as the Sepoys do in India), to make themselves appear taller and more terrible to their enemies.—*Edin's North of Europe.*

FALLS OF NIAGARA.

THESE stupendous cataracts, to which there is no resemblance in the Old World, and which form one of the greatest natural wonders of America, where the works of nature are all on a great scale, have been described a thousand times; but I have seldom seen a better account of them than that which is conveyed in the following detail of an emigrant from Scotland:—

"By casting your eye on the map of North America (says he) you will easily conceive what an immense body of waters must be disgorged from these extensive lakes, or inland seas, situated to the north and west, Erie, St Clair, Huron, Michigan, and Superior, with their innumerable tributary streams, all of which pass through the narrow channel of the River Niagara. The outlet of Lake Erie is at its eastern extremity, at Buffalo, and is about five miles in breadth betwixt the Canadian and the United States shores, and here, properly, the river begins. Three miles farther down, at Black Rock, is the first regular ferry across, and the current runs here so rapidly that a steam-boat of the same power as those that ply on the Firth of Forth, betwixt Leith and Kinghorn, generally makes a semicircle of frequently a mile or two on her passage across. The river is here divided by a beautiful and fertile island (Grand Island) belonging to the States, about twelve or thirteen miles in length, which contains some of the finest land, and some of the most picturesque scenes that I have seen in America. The distance from the island to either shore nowhere exceeds a mile, and in some places on the States side not more than two hundred yards. The channel here is very deep, and the current runs so smoothly, at the rate of from three to four miles an hour, that boats and canoes can pass and repass with ease and safety. Beneath Grand Island, or rather dove-tailed into it, as it were, lies a small island belonging to Great Britain, a mile in length, called Navy Island, at the termination of which the river suddenly widens to about three miles betwixt Fort Slusser on the States side, and Chippawa Village, at the mouth of Chippawa Creek, which forms the entrance to the Welland Canal on the Canadian side. I mention these places so particularly, that you may be able to trace them on the map. The current here begins to run more swiftly, and continues to increase in velocity for two miles, when it arrives at what are called the Great Rapids. These constitute one of the most splendid objects imaginable, and to some they appear as beautiful, though certainly not so sublime, as the great fall itself. They are formed by numerous masses of rock that have been left alone to withstand the rude shocks of this prodigious accumulation of waters, the softer parts in some places having been washed away to a considerable depth by the constant action of the current. It is peculiarly beautiful on a fine summer evening to stand on the Canadian shore, at an elevation of a hundred feet above the river, and see the vast clouds of white foam ascending high in the air, sometimes beautifully tinged by the last rays of the setting sun, long after he has ceased to illumine the dark expanse beneath. There are also, at irregular distances, shelving rocks which appear to have been made of sterner stuff, which run completely across the river, forming numerous embankments, over which the waters roll and tumble with tremendous fury. It is altogether a magnificent scene, and what a painter would much delight to contemplate. These rapids continue battling with the current to the very brink of the great leap, a distance of rather more than a mile, and are divided by another small island, Goat Island, whose foundations may truly be said to be laid in the deep, and which, if it had been placed in the river Thames instead of the river Niagara, would, ere this, have been made a perfect paradise. A handsome bridge, about 150 yards in length, connects it with the village of Manchester. This bridge was built at considerable expense and risk; the workmen employed in its erection had to be secured by ropes tied round their waists, to prevent them from being carried over the Falls, which are almost immediately beneath. It is an object of interest to the tourist, as from the centre arch you have a beautiful view of the rapids, both up and down the river. You are already aware that this island, by dividing the river, makes two separate falls, but by far the largest portion of the waters goes down the Canada side. The breadth from the lower extremity of the island, where the river takes its awful leap, straight across to the British shore, may be about 500 yards, but, as the fall is something in the shape of a horse-shoe, the curve inwards, and deeply indented, the actual breadth is generally estimated at seven hundred or eight hundred yards; my own opinion is, that it cannot be short of half a mile. According to the best authorities of the many scientific men who have visited this place, the height from whence this huge body of water descends in one uninterrupted mass is one hundred and sixty-five feet above the level of the river below. But to enable you to form any idea of this stupendous scene from description, is utterly impossible. I have gazed on it a hundred and a hundred times, and always with increased emotions of admiration, fear, and wonder. When standing on the brink of the awful precipice, you think that the foundations of the earth are falling asunder; the tremulous motion of the rocks beneath your feet, and even of the surrounding country to some distance, which is distinctly felt, and the

mighty thundering of the waters as they descend into the gulf beneath, are enough to shake a person of the strongest nerve. I have stood upon Table Rock, which is a broad shelving projection 180 feet above the boiling caldron, until my quickening pulse and giddy head warned me to retire. I cannot tell you, nor is it possible to ascertain, the depth of the river for some distance, either above or below the falls; but it must be immense to admit the escape of so great a body of water in so narrow a channel. I have heard the noise of the cataract at a distance of twenty miles; and I believe in a dense atmosphere, and the wind blowing in a particular direction down the river, that it may be heard at double that distance. A very heavy spray rises, particularly in clear weather, many hundred feet above the falls, sometimes flying away and incorporating itself with the dark clouds in the extreme distance, but more frequently condensing, and falling on the surrounding country as the wind blows it; and woe betide the poor wretch who is caught in the rain. No Scottish mist ever fell on the braes of Lochaber, or ever wet an Englishman into the skin, quicker than would the spray which ascends from the Falls of Niagara. When the wind blows down the river, the passengers in the ferry-boat are obliged to use umbrellas. By far the finest view of these falls is from the Canadian side, for here you have both the Horse-shoe and the American Fall at once before you. This last mentioned is a most beautiful sheet of water, and well worthy to hold the rank of the second wonder of the world of this kind, although not to be compared, in grandeur and sublimity, with the other. It is about 150 or 200 yards in breadth, and either from its rocky bed being composed of harder materials, or from the greater weight of water coming down on the British side, and wearing away that channel more rapidly, it is about twenty feet higher than the Horse-shoe. It does not fall into a gulf or caldron as the other does, but amongst huge rocks, where it dashes itself into an ocean of foam, and then rushes with tremendous velocity to join its former companion. Our immortal countryman, the author of the "Two Brigs," might have imagined an interesting scene here betwixt the two geni of these falls congratulating each other after their terrible tumble. From Goat Island a handsome flight of steps, well secured, leads you down to the margin of the river, where Sam Patch, of unhappy memory, made his celebrated leap. A ladder was erected 120 feet high, with a platform at the top, from which he descended into the eddy, to the great disappointment of thousands who had come far and near, expecting to see him actually leap over the falls. But no living thing has ever gone over them and been seen again. The story of an Indian in a canoe having achieved this, is all a humbug. On the Canadian side there is also a stair-case by which you can descend to the river, and the strong-hearted and adventurous can, by means of a ledge of rocks, go 150 yards completely in under the great leap—a fearful place truly, and which you are glad to get out of again. Nevertheless, every one who has ventured there must admit that he has been amply rewarded for the risk he ran, in surveying the beauty and grandeur of such a scene. To say nothing of the immense body of waters above, beneath and around you, which is truly awful, you have reflected before you on a fine day, when the sun shines full on the cascade, a succession of the most beautiful prismatic colours that can be imagined; it is altogether a lively scene, and which, once seen, can never be forgotten. It is a matter of no little jeopardy, however, to get the length of Termination Rock, as the farther extremity of this pathway is called, for the shelf or jutting of the rock is in some places so narrow that a single false step would precipitate the luckless wight to immediate destruction. There is a house erected at the head of the stair-case, where you can procure a guide for a trifle, and an oil-cloth garment, without which you would be drenched to the skin instantly by the spray which is constantly dashing around you. There is also kept a kind of album, in which are inserted the names of those who have been so fool-hardy as to venture the length of Termination Rock, and where I also had the honour to insert mine. Here are names recorded from every quarter of the globe, and you would be astonished to find so many in the course of one season as there are from England and Scotland. Amongst the latter, I recognized that of the celebrated Captain Basil Hall. A ferry-boat plys with passengers only about half a mile beneath the Horse-shoe, and lands within a hundred yards of the American fall, which, viewed from this place, has a most magnificent effect; but of all the sensations I ever experienced on water, the motion of this boat is the queerest. It is neither rolling nor tossing, but a mixture of both; yet the current is not so swift, at least not so perceptible, as one would expect from the well known great body of water that is running past; of course it must be of immense depth. The river continues for six miles to run between precipitous banks, from 180 to 200 feet in height, until it comes to Queenstown, forming in many places eddies and whirlpools where no boat could live. The width seldom exceeds 300, and in some places not more than 200 yards. Indeed, many people think, and with some appearance of probability, that the falls must have been as far down as this. An old farmer, who came from Roxburghshire in Scotland, about forty years ago, told me, that in his time he has noticed a perceptible alteration, particularly at the curve of the Horse-shoe, where the heaviest body of water runs, and

which would indicate that the rocks are gradually wearing away. Indeed, from certain landmarks which he pointed out to me, the great leap must now be thirty yards further up the river than it was when he first came to the country. It has been ascertained by naturalists, that the rocks forming the bed of the river, from the rapids upwards, are of a softer nature than those at the falls, and consequently less able to stand the action of the current. Certain people, therefore, who delight in the marvellous, speculate on the time when the bed of the river, having been washed away to a level with the bottom of Lake Erie, will allow its waters, and consequently those of the upper lakes, to escape so rapidly, that Ontario must overflow its banks, Lower Canada and the northern portion of the States be completely laid under water, and the Gulf of St Lawrence turned into another ocean. At Queenstown the high precipitous banks disappear, the river widens to nearly a mile, and continues moving gently at the rate of three or four miles an hour, making many beautiful meanders, until it mingles with the waters of Lake Ontario, twelve miles below the falls, and six below Queenstown."

GRAND CAIRO.

In Cairo you seek in vain to realize the magnificent descriptions of the oriental writers. The immense hills of rubbish on all sides of the city, which have been accumulating for ages, and which are still increased by what is brought out from Cairo daily on the backs of mules, prove the superior magnitude of the old city. But with regard to the general map of the buildings, the modern capital is perhaps as splendid as the famous "Masr" of old; the palaces of caliphs, and some other public buildings, might have beautified the latter, but most of the streets of Cairo have an extremely antique appearance, and present in architecture and materials, no doubt, a picture of what it was formerly. In extent, it is very inferior to Constantinople, and contains about two hundred and fifty thousand inhabitants. But much of the former is taken up with gardens, whereas Cairo is almost destitute of these elegancies. The houses are built of brick of a dirty colour, and are more lofty, and the streets are wider than those of the capital of Turkey. The windows of lattice or frame-work of wood often project a couple of feet beyond the wall, and admit the view of what is passing without, and are at the same time screened from observation; here the inhabitants love to sit. The interior of the houses, from their construction and the position of the windows, has scarcely any sun—coolness and shade being studied as much as possible. The streets are unpaved, but hard; and to allay the dust and keep them cool, the inhabitants throw water over them. Camels loaded with skins of water are almost continually driven through them, and the water flows out on the path as they go along. A traveller is soon convinced that the orientals judge rightly in building their capitals with such narrow streets; it is quite a luxury in this climate to enter one. The height of the houses, and the projection of the upper stories, keep them always cool and shaded, and the burning sun is excluded. This city is chiefly supplied with water from the Nile, in the conveyance of which to the different dwellings a vast number of camels are daily employed. The houses have all terraced roofs, and that of the consul's commands an extensive view of the city. It is delightful to rise by night, and walk there in the brilliant moonlight, which has the appearance of a tranquil and beautiful day; you can see to read with perfect ease. From thence you can look all around on the terraces of other dwellings, on which numbers of the inhabitants lie buried in sleep. During the greater part of the night you hear no sound in this wide capital, not even the tread of a passing traveller, or houseless Arab; nothing disturbs the impressive tranquillity of the hour, which strikes on the imagination. The lonely palm trees, scattered at intervals around, and rising high above the houses, are the only objects which break the view.—*Carré's Letters from the East.*

THE TWO STORY-TELLERS.

The clergymen of two adjoining parishes in Forfarshire (about the end of the last century) were both alike remarkable for an infinite fund of anecdote, as well as for a prodigious willingness, or rather eagerness, to disclose it. When one of them happened to be present in any company, he generally monopolized, or rather prevented, all conversation; when both were present, there was a constant and keenly-contested struggle for the first place. It fell out, on a certain morning, that they breakfasted together, without any other company; when the host, having a kind of right of precedence in virtue of his place, commenced an excellent but very long-winded story, which his guest was compelled to listen to, though disposed, at the end of every sentence, to strike in with his parallel, and far more interesting tale. As the host proceeded with his story, he poured hot water into the teapot; and so completely was he absorbed in the interest of what he was relating, or rather perhaps so intent was he to engage the attention of his listener, that he took no note of what he was doing, but permitted the water first to overflow the vessel into which he was pouring it, then the table, and finally the floor. The guest observed what was going on; but, being resolved for once to give his rival ample scope and verge enough, never indicated by word, or look, or gesture, that he perceived it, till at last, as the speaker brought his voice to a cadence, for the purpose of finishing the tale, he quietly remarked, "Aye, ye may stop now—it's running out at the door!"

CHAMBERS' EDINBURGH JOURNAL

CONDUCTED BY WILLIAM CHAMBERS, AUTHOR OF "THE BOOK OF SCOTLAND," &c., AND BY ROBERT CHAMBERS, AUTHOR OF "TRADITIONS OF EDINBURGH," "PICTURE OF SCOTLAND," &c.

No. 23.

SATURDAY, JULY 7, 1832.

PRICE THREE HALFPENCE.

THE DRAMA.

THEATRICALS are said to be losing public favour in almost every place where they are known, and public writers are puzzled to account for it.

When the buckle-trade declined some years ago, the cause was at once seen to be the ascendancy of buttons. But it would appear that the cause of the decline of theatricals, though almost equally obvious, is more a subject of dispute. It is only so because the subject is larger, and composed of more parts. We think, however, that a little discussion will suffice to show, with equal clearness, what causes the failure of dramatic amusements, as a part of the great system of public entertainment.

Taking the middle of the last century as a period when dramatic exhibitions were generally well attended, let us inquire what there was in the condition and circumstances of the theatre at that period to have rendered this a matter of course. We reply at once, that plays were then as well written, as well *got up*, and as well acted, as any picture was then painted, or any novel or poem written. The drama was at that time on a perfect level with, or perhaps even superior to, the current literature of the day, or any other instrument of public amusement which existed. Nor was it beneath the standard of the general manners of society. It exhibited, in a gross enough manner, the vices of the age; but the people whose vices were exhibited were rendered insensible by those very vices to the grossness of the scene.

The theatre is now in quite a different condition from what it was in then. Whether owing to the want of legislative enactments, which might encourage literary men in writing for the theatre, or to some other cause, our dramatic entertainments are now of a character much beneath or behind the age. Our acting plays are either the old stock, displeasing us with the exhibition of obsolete vices; or modern trash, full of exaggerated character and sentiment, trusting for success, perhaps, to romantic scenery and machinery; or literal transcripts of nursery fables. Our drama, overlooking some better qualities, is, in a great measure, a compound of childishness, indecency, buffoonery, and, to no small extent, of profanity; in every point of view fifty years in taste behind our current fictitious literature, which, in itself, is susceptible of great amendment.

In Great Britain the drama has always appealed to the less serious and virtuous part of the community. At the time of the civil war, and after the re-establishment of the theatre at the Restoration, it was altogether a cavalier thing, and, like the cavalier party in general, too apt to make debauchery a mark of rectitude in politics. This character it has never entirely shaken off. With the exception of a certain number of mawkish and tawdry aphorisms scattered over our modern plays, they still maintain, in some measure, their old war against the decencies and proprieties of life. The truth is, the theatre has become so exclusively resorted to by a less serious part of the community, that it could hardly attempt to conciliate the other class, least, in the vain effort, it lose the customers it has.

If the players thus produce an article of entertainment inferior both in talent and in taste to the other things which compete for the business of amusing the public, it is not to be wondered at that their houses are deserted. For the crown which at present purchases a night's entertainment at the theatre to one member of a family—an entertainment partly childish, perhaps, and almost certain to be somewhat immoral—that whole family can be supplied for a whole month with the best literary productions of the day from a circulating library, or it can purchase a single volume, which not only gives it rational entertainment and instruction for several nights, but remains a constant and ready instrument for repeating this entertainment and instruction whenever it is required. If we coolly reflect on the respective reputations which the drama and literature bear in the world, we will find that only a certain number of people wish well to the former, while the latter is an object of almost universal attachment and national pride. The fact is, that the drama has shut itself out by its own misconduct from the sympathies of half the public, if not a much larger portion. It is still dabbling in the low vices and mean order of feelings which prevailed in the reign of

George II., or else in the nursery tales which lulled our cradles; while literature, shooting far ahead, is replete with the superior virtues and extensive benevolences of the present age. And not only does literature compete with the stage. Music, and other accomplishments of private life, are also now resorted to, for the purpose of furnishing an innocent amusement to the family circle—an amusement less attractive, perhaps, than the theatre, which, with all its errors, has still a powerful inherent charm, but preferred, nevertheless, as making up in simplicity, harmlessness, and cheapness, what it wants in the power of excitement.

When we speak of the stupidity and bad taste of the plays, we do not enumerate all the disadvantages of the theatre. As if every thing connected with the establishment were doomed to be of the same order, we find the players also exciting disgust in all well-regulated minds by the strange code of morality which they have been pleased to set up for themselves. Of course, we do not shut our eyes to the numerous instances of respectable and well-behaved actors, which occur nowhere, perhaps, so frequently as in the minor capital which we inhabit. But, as we remarked in a former paper, we must not have great generalities ruined or broken down by unimportant exceptions. Taken as a whole, the players are a more dissolute fraternity than the members of any other profession; while some of them, ranking as the very highest in professional merit, commit transcendent breaches of the most sacred moral laws, as if to show how independent they are of all the rules of decent society. We would not gratify the wretched vanity which perhaps is one of the principal causes of those errors, by mentioning particular cases; but they are too notorious to require being specified. It is sometimes set forward as a plea for the extenuation of those offences, that the life of a player is more beset with temptations than any other; but what an argument is here against the whole system of play-acting! Another plea is, that the public has no business with any thing but the public appearance of a player—has no right to think of their private lives; as if a person doing all he can to destroy the safeguards of domestic happiness by action and example, were to be equally well treated by society, as a person who does what is in his power to contribute to his happiness. Society must, in the eyes of these pleaders, be a slavish thing indeed, if it is supposed that it must patiently submit to every insult and injury which it may please the sublime caprice of a buffoon to inflict upon it. And is the player judged less leniently than an offender in any other walk of life? When a tradesman commits an outrage on public decency, is he cherished on account of it by society? Is he not scouted for it, exactly as the player is, or, we should rather say, *ought to be*—for it can hardly be said that he is ever condemned for his offences by the regular friends of the stage, though the theatre is, on his account, still more resolutely abstained from by the good, who abstained from it before.

If the players thus debase themselves by the impurity of their lives, and thereby render themselves unfit to be looked upon or listened to by the majority of society—if they continue to represent dramas suited to the taste of a past age, or else adapted only to the sympathies of children—if they persist in retaining about their whole system vicious forms of speech, indelicate gestures, and a code of moral feeling and action, all of which have long been pronounced intolerable in good society, how can they expect their theatres to be so prosperous as they once were, more especially when purer and better modes of entertainment are every where rising into competition with them? The person who pens these thoughts is by no means an enemy to theatricals in the abstract. With the most respectful deference to those who see in dramatic entertainments an express hostility to the divine law, he retains the conviction that they might be rendered as good and innocent a means as any other for producing that great end—the diversion of the public mind by amusement from the follies and vices of absolute vacuity. He does not consider the theatre, or any other amusement, so much with a reference to the good it may do, as with respect to the evil which it may prevent. It is clear, however, that the really good and pure can never become the friends of the theatre, so long as it remains unreformed. There must be a combination among the virtuous actors to exclude the vicious from their body. A

number of antiquated and absurd fashions of the stage must be brought nearer to the standard of ordinary natural life. And the best literary men of the day must be encouraged by legislative enactments to produce a crop of new plays with a stronger moral bent than the generality of those now existing. Till all this is done, and the theatre become as noted in public fame for a friendliness to what is good, as it has hitherto been for the reverse, it must be content to occupy its present degraded place amongst our prevailing modes of public entertainment.

POPULAR INFORMATION ON SCIENCE.

HEAT—ITS DIFFUSION THROUGH NATURE.

THE desire of obtaining knowledge is one of the most natural, and, at the same time, most ennobling attributes of the human mind; for it is impossible, whatever may be our station in life, to walk through the world without witnessing facts of the highest interest, which cannot be duly appreciated unless properly understood. Again, then, we would insist that all such information may be obtained without our having to wade through a mass of difficulties; indeed, truth disdains all scholastic artifices; she loves not to appear masqueraded in the costume of quaint and hyperbolical devices; her ways are ways of the utmost simplicity, and may be readily understood by every person desirous of acquiring knowledge. In the last article, under the title of "Popular Information on Science," we explained, in a general manner, the sources, the nature, and the effects of light; and now, proceeding on the same principle—that is, avoiding as much as possible the use of scientific terms, and endeavouring to explain every thing in the most simple manner, we shall devote our attention to the subject of heat. We cannot look abroad, and take a survey of the magnificent theatre of nature, without perceiving at once the vast importance of this agent;—by its power, rocks, islands, hills, and mountains, have been upraised out of the innermost depths of the earth;—by its operation, the genial moisture, which, under the form of rain, descends, cooling the heated air and refreshing the parched-up soil, is raised from the bosoms of rivers, lakes, and seas;—by its influence, the waters, which were chained up by frost during the desolate reign of winter, are again set free to sparkle along at the bases of their sunny banks;—by its benignant agency, the trees, that were deprived of their foliage, and the herbs, that were apparently withered, are again invigorated with new life, and arrayed in new beauty;—it controls and modifies, indeed, life under every form, and is the most universally pervading and important agent with which we are acquainted.

When we picture to ourselves the dreary monotony of the polar regions, where human nature appears in its most humble and degraded form, and where the arctic bears, wolves, and foxes, seem alone to find appropriate habitations; and when we compare these trackless solitary wastes with the blooming and Eden-like valleys of Italy, we at once see the vast influence of different temperatures on the surface of the globe; nor have we any hesitation in referring such modifications to the sun, which is the most obvious fountain both of heat and light. The ancients, at a period when science was in its infancy, observed this general fact, and concluded that the sun was an immense globe of fire; but this opinion has been long since exploded. The astronomers of this enlightened age have shown, by the aid of telescopes, that the sun is itself a solid and opaque body, perhaps a habitable globe, and they have concluded that we owe both its light and heat to the peculiar atmosphere by which it is surrounded. However, although this opinion has been advocated by that illustrious astronomer, Sir William Herschel, it must be confessed that the manner and region of the sun in which heat and light are generated, can by no means be understood, and on this, as on every other subject of inquiry, it is better to acknowledge our ignorance than to raise up a plausible and false theory to supply the place of more positive and satisfactory knowledge. Certain it is, that the rays of the sun do impart heat; but we must observe, that they do not do so unless they come into contact with some solid body—that is to say, they pass freely through the air without giving out any sensible heat until they reach the surface of the earth. Accordingly, the higher we ascend in the air, the colder it becomes—a fact experienced by astro-

nauts, or those who have ascended in balloons. Thus, M. Charles, Gay Lussac, and others, have on such occasions found the thermometer sink a great many degrees, even below the freezing point. It is from the same cause that the higher we ascend a mountain, the more intense does the cold become, so that we at length arrive at a region where we can trace no signs of animal or vegetable life, all around being shrouded in perpetual snow. When we ascend the Cimborazo mountain, which forms the extremity of the Andes in South America, and which rises to the height of twenty thousand nine hundred feet above the surface of the earth, we leave at its base a hot region, where the exhalations of a marshy soil, and the continuance of heat, generate fevers and diseases fatal to animal and vegetable life. We then, ascending higher, arrive at a temperate region, which possesses a moderate and constant warmth, and is a perpetual season of spring to those who have arrived from the lower, summer-like, hot region. Above this again, as we ascend still higher, we find ourselves surrounded by ice and snow, and then we suffer the most intense winter cold, so that we may truly say that summer, winter, and spring, are here seated on three distinct thrones, which they never quit, and where they are constantly surrounded by the attributes of their powers. Vegetable and animal life, in these different regions, presents us with equally remarkable gradations—thus, the forests of the lower or burning regions are extremely rich, and they continually resound with the howlings of different tribes of monkeys, and the jaguar ant-eater and black tiger prowls about them, while the surrounding air is infested with myriads of mosquitoes and other obnoxious insects. Higher up the mountain we find the most splendid palm trees, upon which the sloth may be seen hanging, and at the feet of which the terrible boa-constrictor and crocodile may be often seen extending their frightful forms. Above this region we meet with the most beautiful arboreous ferns, and the precious hark tree, and many flowers of great beauty; but here the air as we ascend, becoming colder, the sensitive plant, as if warning us of the sterility and lifelessness of the region to which we are approximating, loses its peculiar sensibility, and no longer closes its leaves on being touched. At length, as we proceed higher, the gigantic trees appear to have dwindled; the eye rests on nothing but short stunted dwarfish shrubs and alpine plants, until at last the lichens and mosses amidst patches of scattered snow apprise us that we have arrived at the boundary of organised beings; and that above us is nothing save the dreary region of eternal winter. Here no animal is observed, excepting occasionally the great condor, which is the only living being that appears to inhabit these vast solitudes. Here it is obvious that there is a regular gradation of temperature from the surface of the earth to the upper regions of the air, and for every hundred and ten yards of ascent, the heat diminishes as much as if we were to advance one degree of latitude towards the northern polar regions. The facts here described are of very great importance, because we observe that on this account certain parts of the world are rendered not only habitable, but possess a fine and genial climate, which would otherwise be parched up by a tropical and burning sun. The city of Quito, for example, is almost under the equator, and were we to form a superficial judgment of its temperature from its situation, we might infer that it would be oppressed with intolerable heat, instead of which, owing to its elevation, the air of that city differs little in temperature from that which we find in Paris.

We now, therefore, understand that the rays of the sun do not produce heat unless they strike against some solid body, and even then the greater or lesser intensity of the heat they produce is greatly modified by the direction which they take; for when these solar rays fall directly or vertically on a particular district, they give out much greater heat than when they fall obliquely. The reason for which is simply this; that when they descend on a spot directly or vertically, they fall on it with much force, and a great number of them are included in a small space; whereas, when their direction is more oblique, they not only do not strike the spot with the same force, but are more scattered, so that they by no means produce the same intensity of heat. By this general fact, then, we are enabled to explain the diminution of temperature from the equator to the poles; that is, from the tropical to the frigid regions. Near the equator we find a zone, which passes immediately under the sun twice a year, and receives its rays in a very direct or vertical manner; and here we have the tropical region. Next in succession we find a portion of the globe which does not receive the sun's rays so directly or vertically, but, on the contrary, more obliquely, so that less heat is produced; and here, therefore, we find the temperate region. After this we arrive at another region of the globe, which is deprived of the heat of the sun for a greater part of the year, and, during the other, receives its rays still more obliquely; and here, consequently, we have the frigid zone, that desolate region of eternal ice and snow, which has been explored in vain by so many bold and enterprising navigators. This variety of temperature, occasioned by the different direction which the sun's rays take in reaching the earth, is remarkably obvious in hilly countries. If a hill, having a southerly aspect, present a certain inclination, and the sun be at a corresponding altitude, the solar rays will strike the side of the hill perpendicularly, while on the plain below and around, the rays strike the soil obliquely, and, consequently, with a proportionate diminution of force. If the ground extend to the north, it will receive no rays, and remain always in shade; and on this account it is that in the Valais we see the Alps on one side, covered with eternal ice, whilst the opposite hills are adorned with rich vineyards, and orchards, and all the charms of fertility. Nor is the different manner in which the rays of the sun strike the earth the only circumstance to be considered in examining the temperature of different climates; for the rays of heat, like the rays of light, undergo a greater or lesser reflection; that is, when they strike

the earth, they are thrown back into the atmosphere, and are more or less confined and diffused among the watery vapour with which it is always loaded. Hence arises the warm and genial temperature which surrounds the immediate surface of the earth, and which is so admirably adapted to support vegetable and animal life. Some soils likewise absorb the sun's rays more than others; thus a moist clayey soil takes up and retains the rays of heat for a considerable time; a dry sandy surface, on the contrary, immediately reflects them; and thence it is that the traveller, in journeying through the sandy deserts of Africa, experiences the most oppressive and almost intolerable heat. This is aggravated by the dryness of the air; for when it contains much moisture, as is the case over marshy soils, the heat is considerably diminished; but such marshes in hot countries undergo fermentation, and give rise to exhalations that produce the most pestilential diseases. The vicinity of the sea moderates also very considerably the effects of temperature; and on this account the interior of continents is colder than their coasts. Accordingly, so intense is the cold in the mountains of Norway, that it proved fatal during the war to most of the Swedish army, the dead bodies of the soldiers having been found lying rank and file; but those who live on the coasts of this country enjoy a very mild and agreeable climate. When the sun's rays fall on the surface of the water, part of them enter it, and the continual motion of the waves presenting a cool and fresh surface to the heated air, it is cooled, so that, while the land air is heated, and rises up into the upper regions, a cool sea breeze springs up and rushes in to supply its place. The vicinity of the sea, therefore, moderates the heat of summer. Again it is known that the temperature of water is always more equalised than that of land, and, consequently, in winter, when the sun's rays fall very obliquely on the earth, and its surface is covered with snow which prevents the heat of the earth radiating into the air, the sea, having a more uniform temperature, continues to radiate heat, and thus a warmer region of air is formed, which modifies the cold of winter. Accordingly, at Plymouth, although the mean heat of the year is, on the whole, a little less than at Paris, the winter months are much less severe. So likewise, in the coldest winter season, the temperature of Edinburgh is some degrees warmer than that of London. From all, therefore, we have now stated, it must appear obvious that, while we regard the sun as the most obvious source of heat, yet the heat so produced is modified by the direction which the solar rays take in reaching the earth, by the reflection and absorption they there undergo, and by the vicinity of the sea.

Hitherto we have considered the heat produced on the surface of the earth by the direct and immediate action of the sun; but, independent of this, we have evidence of the existence of very intense heat in the central depths of the earth. In going down into deep mines, the temperature of the air has been found to increase as we descend, but the presence of the miners, the lamps and candles they use, and the explosions of gunpowder, render many of such experiments very erroneous. Other methods, therefore, to examine into the truth of the supposed fact, have been had recourse to, such as boring and cutting niches into rocks, taking at the same time as much precaution as possible against every source of fallacy. Still the result has been the same, and leads to the inference that a very great heat exists at a depth of the earth, and which is beyond the reach of the sun's influence. The hot springs which abound not only in volcanic districts, but in various other parts of the world, also lead to the same conclusion; and of these we need only refer to those which are celebrated as medicinal in England, France, Italy, and Germany. The most remarkable springs of this kind are found in Iceland, where the principal one is called the Geyser, and is situated in the middle of a plain surrounded by forty other springs of a smaller size. These throw up their waters to a very considerable height. The eruption commences with short jets, which gradually increase in size; the steam then rushes forth furiously, accompanied by a loud thundering noise, resembling, says Sir G. Mackenzie, the distant firing of artillery from a ship at sea until at last a great mass of water is raised to a height of seventy, eighty, or ninety feet. The Icelanders use the more temperate of these springs as warm baths; in those that are hotter, or boiling, they boil their various articles of food, taking only the precaution to cover the vessel used for the purpose to prevent the volcanic odour giving a taste to their food. Volcanoes are also unquestionable proofs of the existence of this subterranean heat, which, we infer, must exist at a considerable depth in the earth, because rocks which we know have their original position at such depths, are, during their violent action, ejected into the air actually liquified by heat. Some of these volcanoes seem to have exhausted themselves, and have become extinct, examples of which we find in the central parts of France and Germany. Others exist in a state of frequent or continual activity, as is the case with Vesuvius, Atna, Stromboli, and Hecla; besides which, we know, that owing to violent volcanic action, immense rocks are forced up often from a considerable depth, even from below the surface of the sea, and so form islands of greater or lesser extent. So recently as the year 1831, in the month of July, an island of this kind arose in the Mediterranean. The water was at first violently agitated, after which vast quantities of smoke and white steam were evolved, and enormous masses of hot cinders, dust, &c. ejected several hundred feet into the air. Captain Stenhouse landed on this island the following August, and estimated its circumference to be about a mile and a quarter. Rocks so formed are said to be of igneous origin, and of such rocks there are numerous examples in the immediate neighbourhood of Edinburgh. Salisbury Crags, Arthur's Seat, the Calton Hill, Inchkeith, North Berwick Ledge, present us with examples, each of these being of igneous origin, having been forced upwards by the agency of heat from a very considerable depth in the earth. In examining either

of these, we at once see how these igneous rocks have rent asunder and forced their way through superincumbent strata, now filling up the immense crevices they have torn open, and now overrunning the whole subjacent mass. When these vast and powerful operations of nature took place, terrible and sublime, indeed, must have been the convulsions exhibited, and altogether beyond the range of the human imagination. From the facts here stated—from the temperature increasing in the deeper parts of rocks and mines—from the existence of hot springs in various parts of the world—from the phenomena exhibited by volcanoes, and the appearances of rocks that have visibly undergone a state of fusion, we are entitled to infer the existence of heat as a most important agent beneath the surface of the earth; and whether it arise from central fire, or whether it be generated by some remarkable chemical actions that are in progress, has not been satisfactorily determined. In taking this general survey of the sources and influence of heat in nature, we ought not to omit observing, that it is often seen to arise from electricity. Even in this country, where thunder storms are by no means so violent as in other parts of the world, nothing is more common than for lightning to melt metallic substances, especially iron.

Already, in our former article on light, we explained how it might be procured artificially by friction, or the rubbing of one body smartly against another, by which method the New Hollanders, Arctic Highlanders of Baffin's Bay, Fuegians, and other uncivilised tribes, are in the habit of obtaining it. We likewise showed that it might be readily produced by concussion, or the violent collision of one body against another—as when a piece of flint is struck forcibly against a piece of iron; and furthermore stated that it might be kept up with a greater or lesser intensity by the burning of inflammable bodies, which is what is termed combustion. The compression of the particles of bodies nearer to each other is always more or less attended by an evolution of heat; and this is the case with air: for if a quantity of air be confined in a syringe, in which there is a piece of tinder at the bottom, and then violently compressed, sufficient heat is produced to ignite the tinder. It has also been recently shown by one of the members of the Academy of Paris, that water itself, when submitted to a pressure of twenty atmospheres, gives out a certain quantity of heat. But it will be asked, what is the nature of heat? of what does it actually consist? In reply to which we shall simply state, that there are two opinions advocated; the one is, that heat consists of nothing more than a certain vibration or motion of the particles of the hot body; the other, that it does not consist of any such tremor of the particles of the heated body, but is itself an independent substance, being an extremely subtle and elastic fluid, contained and dispersed among the pores of matter. This latter view appears to us the most plausible, and among other reasons for our thinking so, we may briefly state two:—The first is, that the addition of heat to a body increases its bulk, leading us to suppose that it receives some addition; the second is, that bodies throw out or radiate their heat to a considerable distance, which could scarcely happen unless the heat so evolved were distinct, and independent of the body itself, whence it proceeds. Heat, therefore, we conclude, is a very subtle and elastic fluid; but we should here mention, that some philosophers consider that light and heat are only modifications of each other, and this opinion has been very ingeniously supported by Sir John Leslie, of the Edinburgh University. Whatever be the abstract nature of heat, its accumulation in, or abstraction from, different bodies, gives rise to the most remarkable changes, which, as we proceed with these articles, we shall take every opportunity of explaining, at the same time referring especially to those phenomena of nature which, to a comprehensive mind, afford finer and grander illustrations of science than any experiments described for the laboratory of the chemist.

THE GRIDIRON,

OR PADDY MULLOWNEY'S TRAVELS IN FRANCE.

A CERTAIN old gentleman in the west of Ireland, whose love of the ridiculous quite equalled his taste for claret and fox-hunting, was wont, upon certain festive occasions when opportunity offered, to amuse his friends by drawing out one of his servants who was exceeding fond of what he termed his "thravels," and in whom a good deal of whim, some queer stories, and perhaps, more than all, long and faithful services, had established a right of locquacity. He was one of those few trusty and privileged domestics, who, if his master unheedingly uttered a rash thing in a fit of passion, would venture to set him right. If the squire said, "I'll turn that rascal off," my friend Pat would say, "thro' you wont, sir;" and Pat was always right; for if any altercation arose upon the "subject-matter in hand," he was sure to throw in some good reason, either from former service, general good conduct, or the delinquent's "wife and childher," that always turned the scale.

But I am digressing: on such merry meetings as I have alluded to, the master, after making certain "approaches," as a military man would say, as the preparatory steps in laying siege to some *extravaganza* of his servant, might, perchance, assail Pat thus:—"By the bye, Sir John (addressing a distinguished guest), Pat has a very curious story, which something you told me to-day reminds me of. You remember Pat," turning to the man, evidently pleased at the notice thus paid to himself—"you remember that queer adventure you had in France?"

"Throth I do, sir," grins forth Pat.

"What!" exclaims Sir John, in feigned surprise, "was Pat ever in France?"

"Indeed he was," cries mine host; and Pat adds, "ay, and farther, please your honour."

"I assure you, Sir John," continues my host,

"Pat told me a story once that surprised me very much, respecting the ignorance of the French."

"Indeed!" rejoins the baronet; "really, I always supposed the French to be a most accomplished people."

"Throth then, they're not, sir," interrupts Pat.

"Oh, by no means," adds mine host, shaking his head emphatically.

"I believe, Pat," 'twas when you were crossing the Atlantic?" says the master, turning to Pat with a seductive air, and leading him into the "full and true account"—(for Pat had thought fit to visit *North America*, for "a raison he had," in the autumn of the year ninety-eight.)

"Yes, sir," says Pat, "the broad Atlantic," a favourite phrase of his, which he gave with a brogue as broad, almost, as the Atlantic itself.

"It was the time I was lost in crassin' the broad Atlantic, a-comin' home," began Pat, decoyed into the recital; "whin the winds began to blow, and the sae to rowl, that you'd think the *Colleen dhas* (that was her name) would not have a mast left but what would rowl out of her."

Well, sure enough, the masts went by the board at last, and the pumps was choak'd (devil choak them for that same), and av coorse the wather gaok an us, and, throth, to be filled with wather is neither good for man or baste; and she was sinkin' fast, settlin' down, as the sailors calls it, and faith I never was good at settlin' down in my life, and I liked it then less nor ever; accordingly we prepared for the worst, and put out the boat, and got a sack o' bishkits, and a cashk o' pork, and a kag o' wather, and a thrifle o' rum aboard, and any other little matters we could think iv in the mortal hurry we wor in—and faith there was no time to be lost, for my darlint, the *Colleen dhas*, went down like a lump o' lead, afore we wor many strokes o' the oar away from her.

Well, we drifted away all that night, and next mornin' we put up a blanket an the ind av a pole as well as we could, and thin we sailed iligant, for we darnt show a sitch o' canvass the night before, becase it was blowin' like bloody murder, saviu' your presence, and sure its the wonder of the world we wornt swallay'd alive by the ragin' sae.

Well, away we wint, for more nor a week, and nothin' before our two good-lookin' eyes but the canopy iv heaven, and the wide ocean—the broad Atlantic—not a thing was to be seen but the sae and sky; and though the sae and the sky is mighty purty things in themselves, throth they're no great things when you've nothin' else to look at for a week together—and the barest rock in the world, so it was land, would be more welkin. And then, soon enough throth, our provisions began to run low, the bishkits, and the wather, and the rum—throth that was gone first of all, God help us—and, oh! it was thin that starvation began to stare us in the face—"Oh, murther, murther, captain darlint," says I, "I wish we could see land any where," says I.

"More power to your elbow, Paddy, my boy," says he; "for sitch a good wish, and throth its myself wishes the same."

"Oh," says I, "that it may plaze you, sweet queen iv heaven, supposing it was only a *dissolute* island," says I, "inhabited with Turks, sure they wouldn't be such bad Christians as to refuse us a bit and a sup."

"Whisht, whisht, Paddy," says the captain, "don't be talkin' bad of any one," says he; "you don't know how soon you may want a good word put in for yourself, if you should be called to quarters in th' other world all of a sudden," says he.

"Thrus for you, captain darlint," says I—I called him darlint, and made free wid him, you see, becase distress makes us all equal—"thrus for you, captain jewel—God betune us and harm, I owe no man any spite"—and throth that was only thruth. Well, the last bishkit was sarved out, and the *wather itself* was all gone at last, and we passed the night mighty cowl—well, at the brake o' day the sun riz most beautiful out o' the waves, that was as bright as silver—and as clear as cryshthal. But it was only the more crule upon us, for we wor beginnin' to feel *terrible* hungry; when all at wanst I thought I spied the land—I thought I felt my heart up in my throth in a minnit, and "thunder and turf, captain," says I, "look to leeward," says I.

"What for?" says he.

"I think I see the land," says I. So he ups with his bring-'im-near—(that's what the sailors call a spy-glass, sir), and looks out, and, sure enough, it was.

"Hurra!" says he. "we're all right now; 'pull away my boys, says he."

"Take care you're not mistaken," says I; "maybe its only a fog-bank, captain darlint," says I.

"Oh no," says he, "it's the land in airnest."

"Oh then, whereabouts in the wide world are we, captain?" says I; "maybe it'd be in *Roosia*, or *Frussia*, or the Garman Ocean," says I.

"Tut, you fool," says he—for he had that consaited way wid him—thinkin' himself cleverer nor any one else—"that's *France*," says he.

"Do you tell me so? and how do you know it's France it is, captain dear?" says I.

"Bekease this is the Bay o' Bishky we're in now," says he.

"Throth I was thinkin' so myself," says I, "by the rowl it has; for I often heerd av it in regard o' chat same; and throth the likes iv it I never seen before nor since, and, with the help o' God, never will."

Well, with that my heart began to grow light; and

when I seen my life was safe, I began to grow twice hungrier nor ever—"So," says I, "captain jewel, I wish we had a gridiron."

"Why, then," says he, "thunder and turf," says he, "what puts a gridiron into your head?"

"Bekease I'm starvin' with hunger," says I.

"And sure, bad luck to you," says he, "you couldn't ate a gridiron," says he, "barrin' you wor a *pelican o' the wilderness*," says he.

"Ate a gridiron!" says I; "och, in throth I'm not sitch a *gommooh* all out as that any how. But sure if we had a gridiron we could dress a beef-stake," says I.

"Arrah! but where's the beef-stake?" says he.

"Sure couldn't we cut a slice aff the pork," says I.

"I never thought o' that," says the captain.

"You're a clever fellow, Paddy," says he, laughin'.

"There's many a thrue word said in juke," says I.

"Thrus for you, Paddy," says he.

"Well, then," says I, "if you put me ashore there beyant" (for we were nearin' the land all the time), "and sure I can ax thim for to lind me the loan of a gridiron," says I.

"Oh the butther's comin' out o' the stir-about in airnist now," says he; "you *gommooh*," says he, "sure I towld you before that's France—and sure they're all furniners there," says the captain.

"Well," says I, "and how do you know but I'm as good a furniner myself as any o' thim?"

"What do you mane?" says he.

"I mane," says I, "what I towld you, that I'm as good a furniner myself as any o' thim."

"Make me sinible," says he.

"By dad maybe that's more nor me, or greater nor me, could do," says I—and we all began to laugh at him, for I thought I'd pay him off for his bit o' consait about the Garman Ocean.

"Leave aff your humbuggin'," says he, "I bid you, and tell me what it is you mane at all at all."

"*Parly voo Frongsay*," says I.

"Oh, your humble sarvant," says he; "why, you're a scholar, Paddy."

"Throth you may say that," says I.

"Why, you're a clever fellow, Paddy," says the captain, jeerin' like.

"You're not the first that said that," says I, "whether you joke or no."

"But I'm in airnest," says the captain—"and do you tell me, Paddy," says he, "that you spake Frinch?" "*Parly voo Frongsay*," says I.

"That bangs Banagher, and all the world knows Banagher bangs the divil—I never met the likes o' you, Paddy," says he—"pull away, boys, and put Paddy ashore, and maybe we wont get a good bellyful before long."

So with that it was no sooner said nor done—they pulled away and got close into shore in less than no time, and run the boat up in a little creek, and a beautiful creek it was, with a lovely white strand; and out I got, and it's stiff enough in my limbs I was ather bein' cramp'd up in the boat, and perished with the cold and hunger; but I contrived to scramble on, one way or the other, tow'rds a little bit iv a wood that was close to the shore, and the smoke curlin' out of it quite timplin' like.

"By the powders o' war I'm all right," says I; "there's a house there"—and sure enough there was, and a parcel of men, women, and childher, ating their dinner round a table quite convaynient. And so I wint up to the door, and I thought I'd be very civil to thim, as I heerd the Frinch was always mighty plite intirely—and I thought I'd show them I knew what good manners was.

So I took aff my hat, and making a low bow, says I, "God save all here," says I.

Well, to be sure, they all stopt ating at wanst, and began to stare at me, and faith they almost looked me out of countenance—and I thought to myself it was not good manners at all—more betoken from furniners, which they call so mighty plite; but I never minded that, in regard of wantin' the gridiron; and so, says I, "I beg your pardon," says I, "for the liberty I take, but it's only bein' in distress in regard of ating," says I, "that I make bowld to trouble yez, and if you could lind me the loan of a gridiron," says I, "I'd be intirely obleeged to yez."

They all stared at me twice worse nor before, and with that, says I (knowing what was in their minds), "indeed it's thrue for you," says I; "I'm tathered to pieces, and God knows I look quare enough, but it's by reason of the storm," says I, "which dhruv us ashore here below, and we're all starvin'," says I.

So thin they began to look at each other agin, and myself, seeing that they tuk me for a poor beggar comin' to crave charity—with that, says I, "Oh! not at all," says I, "by no manes; we have plenty o' mate ourselves there below, and we'll dress it," says I, "if you would be plased to lind us the loan of a gridiron," said I, makin' a low bow.

Well, sir, with that, throth they stared at me twice worse nor ever, and faith I began to think that maybe the captain was wrong, and that it was not France at all at all—and so says I, "I beg pardon, sir," says I, "to a fine ould man, with a head of hair as white as silver—maybe I'm under a mistake," says I; "but I thought I was in France, sir; aren't you furniners?" says I—"Parly voo Frongsay?"

"We, munseer," says he.

"Then would you lind me the loan of a gridiron," says I, "if you plaze?"

Oh, it was thin that they stared at me as if I had seven heads; and faith myself began to feel flustered like, and onaley—and so says I, making a bow and scrape agin, "I know it's a liberty I take, sir," says I, "but it's only in the regard of bein' oast away, and if you plaze, sir, says I, "*Parly voo Frongsay*."

"We, munseer," says he, mighty sharp.

"Then would you lind me the loan of a gridiron?"

says I, "and you'll obleege me."

Well, sir, the ould chap began to munseer me, but the divil a bit of a gridiron he'd gie me; and so I began to think they were all neygars, for all their fine manners; and throth my blood began to rise, and says I, "If it was you was in distress," says I, "and if it was to ould Ireland you kem, it's not only the gridiron they'd gie you, if you ax'd it, but something to put an it too, and the dhrop o' dhrank into the bargain, and *cead mile failte*."

Well, the word *cead mile failte* seemed to shreck his heart, and the ould chap coked his ear, and so I thought I'd give him another offer, and make him sinible at last; and so says I, wanst more, quite slow, that he might understand—"Parly voo Frongsay, munseer?"

"We, munseer," says he.

"Then lind me the loan of a gridiron," says I,

"and bad scam to you."

Well, bad win' to the bit of it he'd gi' me, and the ould chap begins bowin' and scrapin', and said something or other about a long tongs.

"Pho!—the divil sweep yourself and your tongs," says I; "I don't want a tongs at all at all; but can't you listen to raison," says I—"Parly voo Frongsay?"

"We, munseer."

"Then lind me the loan of a gridiron," says I,

"and howld your prate."

Well, what would you think but he shook his ould noddle, as much as to say he wouldn't; and so says I, "Bad cess to the likes o' that I ever seen—throth if you wor in my country, it's not that-a-way they'd use you; the curse o' the crows an you, you ould sinner," says I; "the divil a longer I'll darken your door."

So he seen I was vex'd, and I thought, as I was turnin' away, I seen him begin to relint, and that his conscience troubled him; and says I, turnin' back, "Well, I'll give you one chance more—you ould thief—are you a Christhan at all at all—are you a furniner?" says I, "that all the world calls so plite. Bad luck to you, do you understand your own language?" "*Parly voo Frongsay*?" says I.

"We, munseer," says he.

"Then, thunder and turf," says I, "will you lind me the loan of a gridiron?"

Well, sir, the divil resave the bit of it he'd gi' me—and so with that, the "curse o' the hungry an you, you ould negarly villain," says I; "the back o' my hand and the sowl o' my fut to you; that you may want a gridiron yourself yet," says I; "and wherever I go, high and low, rich and poor, shall hear o' you," says I; and with that I left them there, sir, and kem away—and in throth it's often since, that I thought that it was remarkable.—From *Lover's Legends and Stories of Ireland*.

BIOGRAPHIC SKETCHES.

SIR ISAAC NEWTON.

I HAVE now to lay before my juvenile readers a sketch of the life and pursuits of one of the greatest men whom Great Britain has had the honour of having produced—a person alike distinguished for the great originality and depth of his philosophic views, and the simplicity and amiableness of his character—one whom we are perhaps called on to admire more than to imitate, yet one whose virtues and piety may well serve as an example to individuals in every sphere of life.

Isaac Newton was born on the 25th of December 1642, in the parish of Colstersworth, in Lincolnshire. His father was lord of the manor, and cultivated his own moderate paternal property. After receiving the rudiments of education in the usual manner, under the superintendence of his mother, he was sent, at the age of twelve, to the grammar school at Grantham. The bias of his early genius was shown by a skill in mechanical contrivances, which excited great admiration. Whilst other boys were at play, his leisure was employed in forming working models of mills and machinery; he constructed a water clock from an old box, which had an index moved by a piece of wood sinking as the drops fell from the bottom, and a regular dial plate to indicate the hours. His scientific paper kites, sent up in the dark, with Chinese paper lanterns attached to them, passed for meteors, and astonished the rustic gazers, at a time when such sights were rare and new: the yard of the house in which he lived, he turned into a useful sun-dial, by marking, from numerous observations, the hours upon the walls and roof. In his studies at school, his own report states him to have been negligent, till he was stimulated to exertion by the tyranny of a boy above him, on whom he determined to revenge himself, by passing him in the class; and he never rested till he became the first scholar.

His early attainments were not confined to mechanics; he showed a taste for the fine arts when he was a mere boy, and made very considerable proficiency in drawing, without having received any instruction; he copied prints, and even sketched portraits from life with tolerable fidelity and success. The walls

of his room were decorated with these productions of his leisure hours.

Newton possessed, from his own report, considerable facility in versifying, but, like all young men who are anxious to succeed in gaining a respectable livelihood, he gave up the idle trade for a more serious calling. He lived, when at Grantham, with Mr Clark, an apothecary, who was brother to an undermaster of the school. Miss Story, the young and blooming niece of Mrs Clark, was the only female who is supposed to have made any impression on the heart of Newton. Instead of playing with other boys, he was in the habit of making, for his convenience and amusement, little tables and carriages, which moved mechanically like Merlin's chairs. His attachment to Miss Story is said to have continued even after he was sent to college; but as he could not marry without forfeiting his chance of a fellowship, and as he had no means of supporting a wife and family, he subdued his predilection in silence, and found consolation in the severest labour of study. He retained his feelings of kindness for her whilst she lived, visited her occasionally after she became Mrs Vincent, and, when she sunk into poverty, liberally supplied her wants. His utter unfitness for the humble and laborious details of a farmer's life was manifested by degrees; he was frequently reading under a tree when he should have been inspecting cattle, or superintending labourers; and when he was sent to dispose of farming produce at Grantham market, he was occupied in solving mathematical problems, in a garret or hay-loft, whilst the business was transacted by an old servant who had accompanied him to town. These strong indications of the bias of his disposition were not neglected by his anxious mother; she sent him again for a few months to school, and on the 5th of June 1660, he was admitted a student of Trinity College, Cambridge.

The combination of industry and talents, with an amiable disposition and unassuming manners, naturally attracted the notice of his tutors, and the friendship of his admiring companions; amongst these was Isaac Barrow, afterwards justly celebrated as a preacher and a mathematician. Saunderson's Logic, Kepler's Optics, and the Arithmetic of Infinities, by Wallis, were the books first studied by Newton at Cambridge. He read the Geometry of Descartes diligently, and looked into the subject of judicial astrology, which then engaged some attention. He read little of Euclid, and is said to have regretted, in a subsequent part of his life, that he had not studied the old mathematicians more deeply. He was methodical in every thing; he kept a regular account of all his expenses at Cambridge, and under the date 1664, it is recorded that he purchased a *prism*: the fact of his buying a small piece of common glass may appear insignificant and trifling in itself, but it acquires a deep interest when it is considered as the foundation of his brilliant discoveries in the science of optics. [For the nature of these discoveries, see article POPULAR INFORMATION ON SCIENCE, in the 20th number of the Journal.]

In 1665, the students of the University of Cambridge were suddenly dispersed by the breaking out of a pestilential disorder in the place. Newton retired for safety to his paternal estate; and though he lost for a time the advantages of public libraries and literary conversation, he rendered the years of his retreat a memorable era in his own existence, and in the history of science, by another of his great discoveries, that of the theory of gravitation, or the tendency of bodies towards the centre of our globe. His mind was never idle; experiments, conclusions, and reflections, occupied it continually. He saw an apple fall from a tree, and immediately began to consider the general laws which must regulate all falling bodies. At that time a degree had never been actually measured upon the surface of the earth; his first attempts to account for the wonders of the whole solar system, by the principle of gravitation alone, were therefore imperfect, from the want of sufficient data; but resuming the subject afterwards, he found that the same cause which made an apple fall to the ground, retained the moon and planets in their orbits, and regulated, with a simplicity and power truly wonderful, the motions of all the heavenly bodies.

On his return to Cambridge in 1667, he was elected Fellow of Trinity College, and two years afterwards he was appointed Professor of Mathematics in the place of his friend Dr Barrow, who resigned. His great discoveries in the science of optics formed for some time the principal subject of his lectures, and his new theory of light and colours was explained, with a clearness arising from perfect knowledge, to the satisfaction of a crowded and admiring audience. He was elected a Fellow of the Royal Society in 1667, and is reputed to have been compelled to apply for a dispensation from the usual payment of one shilling weekly, which is contributed by each member towards the expenses. He had at this period of his life no income except what he derived from his college and his professorship, the produce of his estate being absorbed in supporting his mother and her family. His personal wishes were so moderate that he never could regret the want of money, except inasmuch as it limited his purchases of books and scientific instruments, and restricted his power of relieving the distress of others. About the year 1683, he composed his great work, entitled *The Mathematical Principles of Natural Philosophy*. In 1688, the memorable year of the Revolution, he was chosen to represent the University in Parliament, and the honour thus conferred on

him was repeated in 1701. His great merit at last attracted the notice of those who had it in their power to bestow substantial rewards, and he was appointed Warden of the Mint, an office for which his patient and accurate investigations singularly fitted him, and which he held with general approbation till his death. Honours and emoluments now flowed fast upon him. Leibnitz, having felt envious of the discoveries of Newton, tried to revenge himself by sending over a problem, which he thought would show his superiority, by baffling the skill of the English mathematicians: it was received by Newton in the evening after his usual day's labour at the Mint, and he solved it before he retired to rest. After this there was no further attempt made to traduce his fame. In 1705, he received the honour of knighthood from Queen Anne.

Newton's benevolence of disposition led him to perform all the minor duties of social life with great exactness; he paid and received frequent visits; he assumed no superiority in his conversation; he was candid, cheerful, and affable; his society was therefore much sought, and he submitted to intrusions on his valuable time without a murmur; but by early rising, and by a methodical distribution of his hours, he found leisure to study and compose, and every moment which he could command he passed with a pen in his hand and a book before him. He was generous and charitable—one of his maxims being, *that those who gave nothing before death, never, in fact, gave at all*—a sentiment which ought to fall as a solemn admonition on the ear of those miserable-minded men who bequeath their property for such purposes as may purchase a character for philanthropy after death. His wonderful faculties were very little impaired, even in extreme old age; and his cheerful disposition, combined with temperance and a constitution naturally sound, preserved him from the usual infirmities of life. He was of middle size, with a figure inclining to plumpness; his eyes were animated, piercing, and intelligent; the general expression of his countenance was full of life and kindness; his sight was preserved to the last, and his hair in the decline of his days was white as snow. The severe trial of bodily suffering was reserved for the last stage of his existence, and he supported it with characteristic resignation. On the 20th of March 1726, he expired at the advanced age of eighty-four years.

The character of Newton cannot be delineated and discussed like that of ordinary men; its unity is so beautiful, that the biographer must dwell upon it with delight, and the inquiry, by what means he attained an undisputed superiority over his fellow-creatures, must be both interesting and useful. It has been asserted that all men are born equal in talents, and that the difference which exists amongst them is the effect of education; but this is disproved by the observation of every parent and every schoolmaster, a decided inequality in capacity for receiving instruction being exhibited distinctly by children even in infancy. Newton was endowed with talents of the highest order, but those who are less eminently gifted may study his life with advantage, and derive instruction from every part of his career. With a power of intellect almost divine, he demonstrated the motions of the planets, the orbits of the comets, and the cause of the tides of the ocean; he investigated, with complete success, the properties of light and colours, which no man before had even suspected; he was the diligent, sagacious, faithful interpreter of nature, antiquity, and Scripture; his philosophy tended to exalt the glory of the Creator; and he exhibited in his manners the purity and simplicity of the doctrines of the Gospel. He was a firm believer in Christianity, not as men in general believe, by coldly assenting to the truth of doctrines, merely because they have been early inculcated by parents and preceptors. He was deeply learned in history and chronology, and he applied the unrivalled powers of his mighty intellect to the complete examination of a subject, compared with which all others sink into insignificance; the result was a clear conviction of the truth of revealed religion, which is demonstrated in all his works, and which was still more effectually shown in his life and conduct. Those who consider his character will duly appreciate the value of his testimony.—*Clayton's Sketches in Biography.*

LEYDEN.

Leyden is built on the ancient bed of the Rhine, a branch of which river still passes through it, and gives the name of Rhymland to the surrounding country. The town contains about thirty thousand inhabitants, and a hundred and forty-five stone bridges, forming communications between the islands into which Leyden is divided by numerous canals. Every street is undermined by sewers. One of these is a mile in length, and sufficiently large to admit a boat for the purpose of cleansing it. The gutters are covered with boards only, raised at pleasure, to receive the dirt. Leyden signalled itself in 1573, by the stand it made against the Spaniards, when the Duke of Alba had subjected the whole of Holland except this gallant town. The distress to which the besieged were reduced is scarcely surpassed in the history of Europe. Probably none but the Jews have ever suffered greater horrors. For seven weeks the flesh of dogs and horses, with a few roots and herbs, formed the only food of the inhabitants. At length the elements interposed on behalf of the sufferers; one of the dykes was burst by an equinoctial gale; the whole country was inundated; and the deluge that drove away the Spaniards bore on the surface of its waters boats laden with provisions sent from all quarters to the relief of the town. To reward their bravery, the Prince of Orange offered the burghers an

university, or exemption from taxes for a certain number of years. Preferring the former, they have received a just reward in the rise amongst them of many who, in various departments of science, have attained an eminence on which they stand conspicuous to posterity. Foremost in this noble company is Boerhaave, whose talents and perseverance raised him to the rank of the first chemist and physician of his day. He professed these sciences in the university; and in the examination-room his picture is suspended, with those of all who have held the office of professor here. In this venerable society we remarked the portraits of Scaliger, Salmatius, Witsius, and Arminius. The painter Gerard Douw was a native of Leyden, and Rembrandt of its immediate vicinity. The botanical garden does honour to the taste and science with which it was arranged by Boerhaave, who planted there two palm-trees, the living memorials of that great master. The anatomical theatre also is worthy of such a patron; as are the museums of natural history and antiquities, which contain some of the finest collections in Europe of stuffed animals, skeletons, and minerals, besides twenty-four mummies.—*Elliot's North of Europe.*

RATTLING ROARING WILLIE.

A Scottish border minstrel, of whom tradition relates a variety of anecdotes, was a person called by the country people Rattling Roaring Willie, a soubriquet probably derived from his bullying disposition; being, it would seem, such a roaring boy as is frequently mentioned in old plays. It is mentioned of Willie, who was among the last of the minstrels, that while drinking at a place called Newmill, upon Teviot, about five miles above Hawick, he chanced to quarrel with one of his own profession, who was usually distinguished by the odd name of Sweet Milk, from a place on Rule Water so called. They retired to a meadow on the opposite side of the Teviot, to decide the contest with their swords—and Sweet Milk was killed on the spot. A thorn tree marks the scene of the murder, which is still called Sweet Milk Thorn. Willie was taken and executed at Jedburgh, bequeathing his name to the beautiful Scotch air, called "Rattling Roaring Willie." A song was also composed, illustrating his history and woeful end, which terminates with the following verse:—

The lasses of Ousenam water
Are rugging and riving their hair;
And a' for the sake of Willie,
His beauty was so fair.
His beauty was so fair,
And comely for to see;
And drink will be dear to Willie
When Sweet Milk gars him dee.

MOZART.

The charity of this great musician was once appealed to on the street by an old acquaintance, who had seen better days. Mozart put his hand into his pocket, but found nothing there; the discovery was embarrassing and painful under such circumstances, but immediately an idea occurred to that great genius; he requested the man to wait—stepped into a coffee-room, and there instantly composed a minuet, folded up the paper, and gave it to the applicant, recommending him to give it to a music-dealer in the city, who, when he saw the contents, would give him something. The man received five *louis d'ors*. It is needless to observe, that the minuet is considered a masterpiece, it being the production of an artist who composed nothing but masterpieces; but it is more striking, as it displays an extraordinary degree of musical learning, as well as originality.

AN AMERICAN TRADITION.

[By Mrs CHILD.]

THE county of Strafford, New Hampshire, is remarkable for its wild and broken scenery. Ranges of hills, towering one above another, as if eager to look upon the beautiful country, which afar off lies sleeping in the embrace of the clouds—precipices from which the eagle delights to build his eyry—dells rugged and tangled with dark and deep ravines, form the magnificent characteristic of this picturesque region.

A high precipice, called Chocorua's Cliff, is rendered peculiarly interesting by a legend, which tradition alone has saved from utter oblivion. This spot, being in the midst of very romantic scenery, is little known, and less visited; for the vicinity is as yet untraversed by rail-roads or canals, and no "mountain house," perched on the tremendous battlements, allures the traveller hither to mock the majesty of nature with the insipidities of fashion.

In olden time, when Goffe and Whalley passed for wizards and mountain-spirits among the superstitious, the vicinity of the spot we have been describing was occupied by a very small colony, which, either from discontent or enterprise, had retired into this remote part of New Hampshire. Most of them were ordinary men, led to this independent mode of life by impatience of restraint, which as frequently accompanies vulgar obstinacy as generous pride. But there was one master-spirit among them, who was capable of a higher destiny than he ever fulfilled. The consciousness of this stamped something of proud humility on the face of Cornelius Campbell, something of a haughty spirit, strongly curbed by circumstances he could not control, and at which he scorned to murmur. He assumed superiority; but unconsciously there was thrown around him the spell of intellect, and his companions felt, they knew not why, that he "was among them, but not of them." His stature was gigantic, and he had the bold quick tread of one who had wandered frequently and fearlessly among the terrible hiding-places of nature. His voice was harsh, but his whole countenance possessed singular capabilities for tenderness of expression; and sometimes, under the gentle influence of domestic excitement, his hard features would be rapidly lighted up, seeming like the sunshine flying over the shaded fields in an April day.

His companion was one peculiarly calculated to excite and retain the deep strong energies of manly love. She had possessed extraordinary beauty, and had, in the full maturity of an excellent judgment, relinquished several splendid alliances, and incurred her father's displeasure for the sake of Cornelius Campbell. Had political circumstances proved favourable, his talents and ambition would unquestionably have worked out a path to emolument and fame; but he had been a zealous and active enemy of the Stuarts, and the restoration of Charles the Second was a deathblow to his hopes of advancement in his own country. Immediate flight became necessary; America was the chosen place of refuge, and to this solitary spot he withdrew with his family.

A small settlement, in such a remote place, was of course subject to inconvenience and occasional suffering. From the Indians they received neither injury nor insult. No cause of quarrel had ever arisen; and although their frequent visits were sometimes troublesome, they never had given indications of jealousy or malice. Chocorua was considered a prophet among them, and, as such, an object of peculiar respect. He had a mind which education and motive would have nerved with giant strength; but growing up in savage freedom, it wasted itself in fury and ungovernable passions. There was something fearful in the quiet haughtiness of his lip—it seemed so like slumbering power, too proud to be lightly roused, and too implacable to sleep again. In his small black fiery eye, expression lay coiled up like a beautiful snake. The white people knew that his hatred would be terrible; but they had never provoked it, and even the children became too much accustomed to him to fear him.

Chocorua had a son about nine or ten years old, to whom Caroline Campbell had occasionally made such gaudy presents as were likely to attract his savage fancy. This won the child's affections, so that he became a familiar visitant, almost an inmate of their dwelling; and being unrestrained by the courtesies of civilised life, he would inspect every thing, and taste of every thing which came in his way. Some poison, prepared for a mischievous fox which had long troubled the little settlement, was discovered and drunk by the Indian boy, and he went home to his father to sicken and die.

From that moment jealousy and hatred took possession of Chocorua's soul. He never told his suspicions; he brooded over them in secret, to nourish the deadly revenge he contemplated against Cornelius Campbell.

The story of Indian animosity is always the same. Campbell left his hut for the fields early one bright balmy morning in June. Still a lover, though ten years a husband, his last look was turned towards his wife, answering her parting smile—his last action a kiss for each of his children. When he returned, they were dead—all dead! and their disfigured bodies too surely showed that an Indian's hand had done the work!

In such a mind, grief, like all other emotions, was tempestuous. Home had been to him the only verdant spot in the wide desert of life. In his wife and children he had garnered up all his life-heart, and now they were torn from him. The remembrance of her love clung to him like the death-grapple of a drowning man, sucking him down, down into darkness and death. This was followed by a calm a thousand times more terrible—the creeping agony of despair, that brings with it no power of resistance.

"As if the dead could feel
The icy worm around him steal."

For many days, those who knew and revered him feared that the spark of reason was for ever extinguished. But it rekindled again, and with it came a wild demoniac spirit of revenge. The death-groan of Chocorua would make him smile even in his dreams; and when he looked, death seemed too pitiful a vengeance for the anguish that was eating into his very soul.

Chocorua's brethren were absent on a hunting expedition when he committed the murder; and those who watched his movements observed that he frequently climbed the high precipice, which afterwards took his name, probably looking out for their return. Here Campbell resolved to effect his deadly purpose. Having traced the dark-minded prophet to his lair, he was one morning startled at a loud voice, from beneath the precipice, commanding him to throw himself into the deep abyss below. He knew the voice of his enemy, and replied with an Indian's calmness, "the Great Spirit gave life to Chocorua, and Chocorua will not throw it away at the command of a white man." "Then, hear the Great Spirit speak in the white man's thunder!" exclaimed Campbell, as he pointed his rifle to the precipice. Chocorua, though fierce and fearless as the panther, had never overcome his dread of firearms. He placed his hands upon his ears to shut out the stunning report; the next moment the blood bubbled from his neck, and he reeled fearfully on the edge of the precipice. But, recovering and raising himself on his hands, he spoke in a voice rendered more terrific as its huskiness increased—"A curse upon ye, white men! May the Great Spirit curse ye when he speaks in the clouds, and his words are fire! Chocorua had a son—and ye killed him while his eye still loved to look on the bright sun and the green earth! The evil spirit breathe death upon your cattle! Your graves lie in the war-path of the Indians! Panthers howl, and wolves fatten over your bones! Chocorua goes

to the Great Spirit—his curse stays with the white men."

The prophet sunk upon the ground—still uttering inaudible maledictions—and they left his bones to whiten in the sun. But his curse rested on the settlement. The tomahawk and the scalping-knife were busy among them; the winds tore up trees and hurled them at their dwellings; their crops were blasted, their cattle died, and sickness came upon their strongest men. At last the remnant of them departed from the fatal spot, to mingle with more populous and fortunate colonies. Campbell became a hermit, seldom seeking his fellow-men; and two years after the dispersion of this colony, he was found dead in his hut.

To this day the town of Burton, in New Hampshire, is remarkable for a pestilence which infects its cattle; and the superstitious think that Chocorua's spirit still sits enthroned upon his precipice, breathing curses upon them.

A CUP OF GENUINE SHERRY.

THE information formerly conveyed relative to wines, ancient and modern, will be rendered more complete by the following account of the mode of managing the sherry wines previous to their shipment for this country, as given by Sir Arthur de Capell Brooke, in his recently published work, entitled "*Sketches of Spain and Morocco*." It will be remembered that sherry takes its name from the town of Xeres in Spain, which is the chief seat of its manufacture.

"Nothing at Xeres so much surprises the stranger, and is more worthy of his inspection, than the bodegas or wine-vaults. The vintage itself, though interesting, has nothing particularly striking or picturesque in it; and after having walked through the broiling vineyards, and seen the process of picking and pressing the grapes, the curiosity of the traveller will be satisfied. There are few, however, who would not feel inclined, I think, to repeat their visits more than once to the bodegas. The term wine-vaults is ill suited to convey an idea of these really splendid and extraordinary establishments, which I should class among the things best worth seeing in Spain. Instead of descending into a dark, low, grovelling, and nasty magazine, like the London-dock wine-vaults, spacious as they are, you first pass through a street, one entire side of which, for the extent of a quarter of a mile, is occupied by one of these bodegas; and, entering through large folding doors, you find yourself, to your astonishment, in what at first sight appears to be a church of considerable dimensions, with a lofty roof, and divided into spacious aisles.

In the centre you see, in large characters, 'Bodega de Jesus'; and, at the sides, 'Nave of St Andrew, St Pedro, St Jago.' Your eye soon runs along the lower part of the building, and you see some thousand butts of wine ranged along the aisles and against the arched pillars. A delicious fragrance, which you easily recognise, soon convinces you, notwithstanding the pious inscriptions you have been reading, that you are in a place exclusively dedicated to the enjoyments of the body.

On entering, you are waited upon by the superintendent of the bodega, who accompanies you through the different aisles, and who explains to you, in passing each barrel, the name, quality, age, and peculiar flavour of the wine within it; and in order that you may understand it practically as well as theoretically, his observations are rendered clear and intelligible by a full glass of the delicious liquor. You proceed thus slowly through the whole range of the bodega, occasionally reposing, like Bacchus, astride of a large butt, and sipping bumpers of luscious Paxareti, fragrant Muscatel, or dark cream Sherry, half a century old. While in the outside every thing is blazing with the intenseness of the noontide heat, within, a coldness, and a soft mellow light, prevail; and you fancy you should like to pass the remainder of your days in this pleasant retreat. In this manner you keep on quaffing the nectar which is so liberally supplied you, till you think it high time to make your retreat into the hot and dusty streets of Xeres.

Each wine establishment is conducted by an overseer, who is called the capataz, and to whom is entrusted the purchasing of the different wines from the grower, the selection and the mixing of them, as also the proving and tasting of the brandies required. The interior of one of these large bodegas may be compared to an immense hospital filled with patients, and the capataz, or superintendent, to the visiting physician. The former goes his daily round, accompanied by one of the superintendents, whom we will call the apothecary. As he passes each butt, he begins his inquiry into the state of each patient; not by feeling his pulse, but by tapping, which is immediately performed by his attendant, who runs a spike into it, and presents him with a bumper of its contents. On tasting it, he may probably find that the wine is sick, as it is called by the merchants, being usually the case with young wines: a jar or two of brandy is therefore prescribed for the invalid, and the dose is forthwith administered. A second butt may be found to be equally quailish, and is relieved in the same manner. The body or constitution of a third may probably be naturally weak and delicate; this is strengthened and improved by being mixed with wine which is sounder and stronger: while a fourth may be at the very last extremity, so as to require the application of musk. Speaking, however, more seriously, the bodega re-

quires a great deal of skill, constant attention, a nice taste, and a discriminating judgment in the selection not only of the wines but of the brandies; in the improving the delicacy and flavour of the former, increasing or diminishing the body, dryness, and colour, and finally giving such a variety of shades, and differences in flavour and price, as may best suit the particular market, and gratify the taste and appetite of John Bull.

With this I shall conclude the remarks I have been making, merely observing that, however far we may be from drinking the sherry wine in its original state in our own country, owing to the impossibility of preserving it without the addition of a spirituous body, it is so very superior to the lighter kinds of sherry, which are drunk in their pure state, and which supply the general consumption in the country, that the last-mentioned wines cannot be compared to it. To the wealthy merchants and exporters of Xeres, we are indebted for a wine which, like port, may be called a sound British wine, and which is far more suitable to an English constitution and climate than the lighter wines of France and the Rhine."

We have all heard of certain idle enthusiasts who have studied the Spanish tongue for the purpose of reading Don Quixote in the original—who have travelled a thousand miles to taste the waters of the Jordan, or a mouthful of snow from Mont Blanc—to wash their hands in the Pacific, or see the sun rise from the summit of the great Pyramid. In the same feeling of devotion, who would not, after perusing the account of the travelled baronet, wish to set out on an expedition to quaff a cup of genuine sherry in the cool bodegas of Xeres?

RISE OF THE EAST INDIA COMPANY.

HAVING established factories in India, the East India Company found no other obstacle to its success than the hostility of the Dutch, which was long very formidable. "The Dutch (continues Macculloch, in the Dictionary of Commerce) endeavoured to obtain the exclusive possession of the spice trade, and were not at all scrupulous about the means by which they attempted to bring about their favourite object. The English, on their part, naturally exerted themselves to obtain a share of so valuable a commerce; and as neither party was disposed to abandon its views and pretensions, the most violent animosities grew up between them. During the civil war, Indian affairs were necessarily lost sight of; and the Dutch continued, until the ascendancy of the republican party had been established, to reign triumphant in the East, where the English commerce was nearly annihilated. But, notwithstanding their depressed condition, the Company's servants in India laid the foundation, during the period in question, of the settlements at Madras and in Bengal. Permission to build Fort St George was obtained from the native authorities in 1640. In 1653, Madras was raised to the station of a Presidency. In 1645, the Company began to establish factories in Bengal, the principal of which was at Hoogly. These were for a lengthened period subordinate to the presidency of Madras.

No sooner, however, had the civil wars terminated, than the arms and councils of Cromwell retrieved the situation of our affairs in India. The war which broke out between the Long Parliament and the Dutch in 1652, was eminently injurious to the latter. The charter under which the East India Company prosecuted their exclusive trade to India being merely a grant from the crown, and not ratified by any act of Parliament, was understood by the merchants to be at an end when Charles I. was deposed. They were confirmed in this view of the matter, from the circumstance of Charles having himself granted, in 1635, a charter to Sir William Courten and others, authorising them to trade with those parts of India with which the Company had not established any regular intercourse. The reasons alleged in justification of this measure, by the crown, were, that the East India Company had neglected to establish fortified factories, or seats of trade, to which the king's subjects could resort with safety; that they had consulted their own interests only, without any regard to the king's revenue; and, in general, that they had broken the condition on which their charter and exclusive privileges had been granted to them. Courten's association, for the foundation of which such satisfactory reasons had been assigned, continued to trade with India during the remainder of Charles's reign; and no sooner had the arms of the Commonwealth forced the Dutch to desist from their depredations, and to make reparations for the injuries they had inflicted on the English in India, than private adventurers engaged in great numbers in the Indian trade, and carried it on with a zeal, economy, and success, that monopoly can never expect to rival. It is stated in a little work, entitled *Britannia Languens*, published in 1680 (the author of which has evidently been a well-informed and intelligent person), that, during the years 1653, 1654, 1655, and 1656, when the trade to India was open, the private traders imported East India commodities in such large quantities, and sold them at such reduced prices, that they not only supplied the British markets, but had even come into successful competition with the Dutch in the market of Amsterdam, and very much sunk the shares of the Dutch East India Company. This circumstance naturally excited the greatest apprehensions on the part of the

Dutch East India Company; for, besides the danger that they now ran of being deprived, by the active competition of the English merchants, of a considerable part of the trade which they had previously enjoyed, they could hardly expect that, if the trade were thrown open in England, the monopoly would continue in Holland.

Feeling that it was impossible to contend with the private adventurers under a system of fair competition, the moment the treaty with the Dutch had been concluded, the Company began to solicit a renewal of their charter, which they succeeded in receiving from Cromwell in 1657. Charles II. confirmed this charter in 1681, and at the same time conferred on them the power of making peace or war with any people *not of the Christian religion*; of establishing fortifications, garrisons, and colonies; of exporting ammunition and stores to their settlements duty free; of seizing and sending to England such British subjects as should be found trading to India without their leave; and of exercising civil and criminal jurisdiction in their settlements, according to the laws of England. Still, however, as this charter was not fully confirmed by any act of Parliament, it did not prevent traders, or interlopers, as they were termed, from appearing within the limits of the Company's territories. Hence their monopoly was by no means complete; and it was not till after the Revolution that the authority of Parliament was interposed to enable the Company wholly to engross the trade with the East.

In addition to the losses arising from this source, the Company's trade suffered severely during the reign of Charles II. from the hostilities that were then waged with the Dutch, and from the confusion and disorders caused by the contests among the native princes; but in 1668, the Company obtained a very valuable acquisition in the island of Bombay. Charles II. acquired this island as part of the marriage portion of his wife, Catherine of Portugal, and it was now made over to the Company on condition of their not selling or alienating it to any persons whatever, except such as were subjects of the British crown. They were allowed to legislate for their new possession; but it was enjoined that their laws should be consonant to reason, and as near as might be agreeable to the practice of England. They were authorised to maintain their dominion by force of arms; and the natives of Bombay were declared to have the same liberties as natural-born subjects. The Company's western presidency was soon after transferred from Surat to Bombay. But the reign of Charles II. is chiefly memorable in the Company's annals, from its being the commencement of the tea trade. The first notice of tea in the Company's records is found in a dispatch, addressed to their agent at Bantam, dated 24th January 1667-8, in which he is desired to send home 100 lbs. of tea, the best he can get. Such was the late and feeble beginning of the tea trade; a branch of commerce that has long been of vast importance to the British nation, and without which, it is more than probable that the East India Company would long since have ceased to exist, at least as a mercantile body.

In 1677, the Company obtained a fresh renewal of their charter. During the greater part of the reigns of Charles II. and James II., the affairs of the association at home were principally managed by the celebrated Sir Josiah Child, the ablest commercial writer of the time; and in India, by his brother Sir John Child. Sir Josiah was one of the first who projected the formation of a territorial empire in India. But the expedition fitted out in 1686, in the view of accomplishing this purpose, proved unsuccessful; and the Company were glad to accept peace on the terms offered by the Mogul. During the latter part of the reign of Charles II., and that of his successor, the number of private adventurers, or interlopers, in the Indian trade, increased in an unusual degree. After serious contests, the trade was virtually laid open by a vote of the House of Commons: "That all the subjects of England had an equal right to trade to the East Indies, unless prohibited by act of Parliament." Matters continued on this footing till 1698.

THE NEW ZEALANDERS.

AN interesting work, entitled "*A Narrative of a Nine Months' Residence in New Zealand, in 1827, by AUGUSTUS EARLE*," has made its appearance, and presents some new traits of character of the savage inhabitants of that distant island. It appears from the Narrative that these people are much less ferocious than has generally been represented, and that they are a very superior and fine-looking race, in comparison with the natives of New South Wales or Van Dieman's Land. With all the good points of character which the narrator bestows on the natives, it seems they have still a strong hankering after human flesh, as is evident from the following quotation:—

"The New Zealanders (says Mr Earle) have been long charged with cannibalism; but as no person of importance or celebrity had actually been a witness to the disgusting act, in pity to our nature such relations have been universally rejected, and much has been written to prove the non-existence of so hideous a propensity. It was my lot to behold it in all its horrors! One morning, about eleven o'clock, after I had just returned from a long walk, Captain Duke informed me he had heard, from very good authority (though the natives wished it to be kept a

profound secret) that in the adjoining village a female slave named Matowe had been put to death, and that the people were at that very time preparing her flesh for cooking. At the same time he reminded me of a circumstance which had taken place the evening before. Atoi had been paying us a visit, and when going away, he recognised a girl who he said was a slave that had run away from him; he immediately seized hold of her, and gave her in charge to some of his people. The girl had been employed in carrying wood for us; Atoi's laying claim to her had caused us no alarm for her life, and we had thought no more on the subject; but now, to my surprise and horror, I heard this poor girl was the victim they were preparing for the oven! Captain Duke and myself were resolved to witness this dreadful scene. We therefore kept our information as secret as possible, well knowing that if we had manifested our wishes, they would have denied the whole affair. We set out, taking a circuitous route towards the village; and being well acquainted with the road, we came upon them suddenly, and found them in the midst of their abominable ceremonies. On a spot of rising ground, just outside the village, we saw a man preparing a native oven, which is done in the following simple manner:—A hole is made in the ground, and hot stones are put within it, and then all is covered up close. As we approached, we saw evident signs of the murder which had been perpetrated; bloody mats were strewn around, and a boy was standing by them actually laughing; he put his finger to his head, and then pointed towards a bush. I approached the bush, and there discovered a human head. My feelings of horror may be imagined as I recognised the features of the unfortunate girl I had seen forced from our village the preceding evening! We ran towards the fire, and there stood a man occupied in a way few would wish to see. He was preparing the four quarters of a human body for a feast; the large bones, having been taken out, were thrown aside, and the flesh being compressed, he was in the act of forcing it into the oven. While we stood transfixed by this terrible sight, a large dog, which lay before the fire, rose up, seized the bloody head, and walked off with it into the bushes; no doubt to hide it there for another meal! The man completed his task with the most perfect composure, telling us, at the same time, that the repast would not be ready for some hours! Here stood Captain Duke and myself, both witnesses of a scene which many travellers have related, and their relations have invariably been treated with contempt; indeed, the veracity of those who had the temerity to relate such incredible events has been every where questioned. In this instance it was no warrior's flesh to be eaten; no enemy's blood to drink, in order to infuriate them. They had no revenge to gratify; no plea could they make of their passions having been roused by battle, nor the excuse that they ate their enemies to perfect their triumph. This was an action of unjustifiable cannibalism. Atoi, the chief, who had given orders for this cruel feast, had only the night before sold us four pigs for a few pounds of powder; so he had not even the excuse of want of food. After Captain Duke and myself had consulted with each other, we walked into the village, determining to charge Atoi with his brutality. Atoi received us in his usual manner; and his handsome open countenance could not be imagined to belong to so savage a monster as he had proved himself to be. I shuddered at beholding the unusual quantity of potatoes his slaves were preparing to eat with this infernal banquet. We talked coolly with him on the subject; for as we could not prevent what had taken place, we were resolved to learn, if possible, the whole particulars. Atoi at first tried to make us believe he knew nothing about it, and that it was only a meal for his slaves; but we had ascertained it was for himself and his favourite companions. After various endeavours to conceal the fact, Atoi frankly owned that he was only waiting till the cooking was completed to partake of it. He added, that, knowing the horror we Europeans held these feasts in, the natives were always most anxious to conceal them from us, and he was very angry that it had come to our knowledge; but as he had acknowledged the fact, he had no objection to talk about it. He told us that human flesh required a greater number of hours to cook than any other; that if not done enough, it was very tough; but when sufficiently cooked, it was as tender as paper. He held in his hand a piece of paper, which he tore in illustration of his remark. He said the flesh then preparing would not be ready till next morning; but one of his sisters whispered in my ear that her brother was deceiving us, as they intended feasting at sunset. We inquired why and how he had murdered the poor girl. He replied, that running away from him to her own relations was her only crime. He then took us outside his village, and showed us the post to which she had been tied, and laughed to think how he had cheated her:—"For," said he, "I told her I only intended to give her a flogging; but I fired, and shot her through the heart!" My blood ran cold at this relation, and I looked with feelings of horror at the savage while he related it. Shall I be credited when I again affirm that he was not only a handsome young man, but mild and genteel in his demeanour? He was a man we had admitted to our table, and was a general favourite with us all; and the poor victim to his bloody cruelty was a pretty girl of about sixteen years of age! While listening to this frightful detail, we felt sick almost to fainting. We left Atoi, and again strolled to-

wards the spot where this disgusting mess was cooking. Not a native was now near it; a hot fetid steam kept occasionally bursting from the smothered mass; and the same dog we had seen with the head now crept from beneath the bushes, and sneaked towards the village: to add to the gloominess of the whole, a large hawk rose heavily from the very spot where the poor victim had been cut in pieces. My friend and I sat gazing on this melancholy place; it was a lowering gusty day, and the moaning of the wind through the bushes, as it swept round the hill on which we were, seemed in unison with our feelings. After some time spent in contemplating the miserable scene before us, during which we gave full vent to the most passionate exclamations of disgust, we determined to spoil this intended feast. This resolution formed, we rose to execute it. I ran off to our beach, leaving Duke on guard, and, collecting all the white men I could, I informed them of what had happened, and asked them if they would assist in destroying the oven, and burying the remains of the girl: they consented, and each having provided himself with a shovel or a pickaxe, we repaired in a body to the spot. Atoi and his friends had by some means been informed of our intention, and they came out to prevent it. He used various threats, to deter us, and seemed highly indignant; but as none of his followers appeared willing to come to blows, and seemed ashamed that such a transaction should have been discovered by us, we were permitted by them to do as we chose. We accordingly dug a tolerably deep grave; then we resolutely attacked the oven. On removing the earth and leaves, the shocking spectacle was presented to our view—the four quarters of a human body half roasted. During our work, clouds of steam enveloped us, and the disgust created by our task was almost overpowering. We collected all the parts we could recognise; the heart was placed separately, we supposed, as a savoury morsel for the chief himself. We placed the whole in the grave, which we filled up as well as we could, and then broke and scattered the oven." And when they were gone, the natives disinterred their favourite dish, and ate it.

CUSTOMS IN VISITING THE POPE.

WILLIAMS, in his Travels in Italy and Greece, gives an account of certain usages in Rome, of some interest to the English reader. Speaking of the intercourse which subsists betwixt the British residents and the Pope, he proceeds to mention that, "on occasions when the English have been introduced to him, the Pope has taken the opportunity to say flattering things respecting the English character. The number of introductions—for few Englishmen return from Rome without having been introduced, if he is at that time in Rome—cannot fail to be burdensome to his Holiness. As England has had, since the Reformation, no accredited minister at the Roman court, the introduction of the English has usually devolved on some one of the Scotch or Irish ecclesiastics of the Catholic Church resident at Rome. Abbé Grant, of the Scotch college, long performed that office. The person to whom it now belongs (1820) is Abbé Taylor, an Irishman. To this gentleman you signify your wish, for the gratification of which, you have, however, frequently to wait for some time, as his list is in the full season very numerous, and the Pope receives only seven strangers at one time, and many days often elapse between one reception day and the next.

The necessary equipment is a court dress, sword, &c., according to instructions from Abbé Taylor. Persons who have a claim to it may go in uniform, naval or military: and many do this who have no claim. The uniform of a naval lieutenant had got into the hands of a Roman tailor, who had let it out for the occasion of an introduction to the Pope, to so many of our countrymen, that it was nearly as well known at the Vatican as the habit of a Cardinal would be, and the navy lieutenant was a standing joke at Rome.

When the seven persons who are to form that day's party are all arrived at Abbé Taylor's, they set out for the Vatican, where they are first introduced by Cardinal Gonsalvi, and then, being first desired to divest themselves of their swords, are conducted by the Abbé to the presence of the Pope. Nothing can contrast more strongly with the pomp and circumstance of a royal levee than this scene. The Pope sits in a sort of study, at his table, writing, with some books near him, his dress, being quite in dishabille, somewhat like a flannel dressing-gown. When the visitors enter, he rises and comes forward to the circle, and commences conversation, generally preceding it with something complimentary to the English character, and his high esteem for the nation. He observed to a friend of mine, that when he first came as a student to Rome, he scarcely remembered one chimney in the city, but that now he could count nearly 100; this he attributed to the British residents. He particularly mentioned his obligations to the English nation, for the restoration of so many works of art recovered to Rome at their expense. The period for remaining in the Papal presence is various, but generally not exceeding half an hour. Some English ladies procured the honour of an introduction, and wore black veils on the occasion.

We have often met his Holiness taking his favourite walk near the Coliseum. His morning dress is a scarlet mantle, a scarlet hat with a very broad brim, edged with gold, scarlet stockings and shoes. When he is met by the Romans, they invariably fall on their knees, and he gives them his blessing. The British stand and take off their hats, and their bows are gra-

ciously returned. His Holiness's carriage, which is a plain, crazy-looking machine, drawn by six horses with riders in purple livery, always follows him. On one of his walks, the Pope threw some money on the road among some poor people, and, to our surprise, they scrambled and fought for it as soon as his back was turned."

JULY.

Now comes July, and with his fervid noon
Unsinews labour. The swink't mower sleeps;
The weary maid rakes feebly; the warm swain
Pitches his load reluctantly; the faint steer,
Lashing his sides, draws sulkily along
The slow encumbered wain in mid-day heat.

JULY is the seventh month of the year. According to the reckoning of the Romans it was the fifth, and called *QUINTILIS*, until Mark Antony denominated it July, in compliment to Caius Cæsar, the Roman dictator, whose surname was Julius, who improved the calendar and was born in this month.

Leigh Hunt, in his *Months*, has the following characteristic observations on this delightful season of the year. "The heat is greatest in this month on account of its previous duration. The reason why it is less so in August is, that the days are then much shorter, and the influence of the sun has been gradually diminishing. The farmer is still occupied in getting the productions of the earth into his garner; but those who can avoid labour enjoy as much rest and shade as possible. There is a sense of heat and quiet all over nature. The birds are silent. The little brooks are dried up. The earth is chapped with parching. The shadows of the trees are particularly grateful, heavy, and still. The oaks, which are freshest because latest in leaf, form noble clumpy canopies, looking, as you lie under them, of a strong and emulous green against the blue sky. The traveller delights to cut across the country through the fields and the leafy lanes, where nevertheless the flints sparkle with heat. The cattle get into the shade, or stand in the water. The active and air-cutting swallows, now beginning to assemble for migration, seek their prey about the shady places, where the insects, though of differently compounded natures, 'fleshless and bloodless,' seem to get for coolness, as they do at other times for warmth. The sound of insects is also the only audible thing now, increasing rather than lessening the sense of quiet by its gentle contrast. The bee now and then sweeps across the ear with his gravest tone. The quats

Their murmuring small trumpets sounden wide:—SPENSER.

and here and there the little musician of the grass touches forth his trickiest note.

The poetry of earth is never dead;
When all the birds are faint with the hot sun,
And hide in cooling trees, a voice will run
From hedge to hedge about the new-mown mead:
That is the grasshopper's.—KEATS.

Besides some of the flowers of last month, there are now candy-tufts, catch-fly, columbines, egg-plant, French mary-golds, lavateras, London-pride, marvel of Peru, veronicas, tuberoses, which seem born of the white rose and lily; and scarlet-beans, which, though we are apt to think little of them because they furnish us with a good vegetable, are quick and beautiful growers, and in a few weeks will hang a wall or trellis with an exuberant tapestry of scarlet and green.

The additional trees and shrubs in flower are or-ambles button-wood, iteas, cistuses, climbers, and broom. Pimpernel, cockle, and fumitory, are now to be found in corn-fields, the blue-bell in wastes or by the roadsides; and the luxuriant hop is flowering.

The fruits begin to abound, and are more noticed, in proportion to the necessity for them occasioned by the summer heat. The strawberries are in their greatest quantity and perfection; currants, gooseberries, and raspberries, have a world of juice for us, prepared, as it were, in so many crowds of little bottles, in which the sunshine has turned the dews of April into wine. The strawberry lurks about under a beautiful leaf. Currants are also extremely beautiful. A handsome bunch looks like pearls or rubies, and an imitation of it would make a most graceful earring. We have seen it, when held lightly by fair fingers, present as lovely a drop, and piece of contrast, as any holding hand in a picture of Titian.

Bulbous rooted flowers, that have almost done with their leaves, should now be taken up, and deposited in shallow wooden boxes. Mignonette should be transplanted into small pots, carnations be well attended to and supported, and auriculas kept clean from dead leaves and weeds, and in dry weather frequently watered.

It is now the weather for bathing, a refreshment too little taken in this country, either in summer or winter. We say in winter, because with very little care in placing it near a cistern, and having a leathern pipe for it, a bath may be easily filled once or twice a week with warm water; and it is a vulgar error that the warm bath relaxes. An excess, either warm or cold, will relax; and so will any other excess: but the sole effect of the warm bath moderately taken is, that it throws off the bad humours of the body by opening and clearing the pores. As to summer bathing, a father may soon teach his children to swim, and thus perhaps might be the means of saving their lives some day or other, as well as health. Ladies also, though they cannot bathe in the open air as they do in

some of the West Indian islands and other countries, by means of natural basins among the rocks, might oftener make a substitute for it at home in tepid baths. There is perhaps no one thing that so equally contributes to the three graces of health, beauty, and good temper;—to health, in putting the body into its best state; to beauty, in clearing and tinting the skin; and to good temper, in rescuing the spirits from the irritability occasioned by those formidable personages, 'the nerves,' which nothing else allays in so quick and entire a manner."

GARDENING.—JULY.

FRUIT GARDEN.—In the beginning of this month, thin finally the later-ripening apricots, and early peaches and nectarines, following up those which ripen in succession. Wall-trees and espaliers must be looked over, and divested of their superfluous wood, and the rest trained regularly and neatly at length. Vines must be looked over, their tendrils taken off, the laterals shortened to one joint, if the upper bud has pushed since the last month long enough to require this to be done. The shoots which have produced fruit must be shortened to two joints above the uppermost branch, keeping those closely trained to the wall. Runners of all sorts of strawberries should now be taken off, and the young plants bedded out, in order to have them strong and well rooted previously to their being finally planted out in the autumn. Should the weather prove dry, they must be well watered till they have taken root.

KITCHEN GARDEN.—Sow Cape broccoli, endive, kidney beans, lettuces, spinach, and turnips; hoe carrots, leeks, onions, parsnips, and turnips; plant out broccoli, cauliflowers, and winter greens. Plant out celery on the surface of rich ground, and on trenches, taking care to take up each plant with all its roots, and to divest it of all its side shoots to its principal leaves, which would otherwise prevent its making a fine clean handsome head. Prepare mushroom spawn, if not done last month. Cucumbers will now be in full bearing upon the ridges, and should be pegged down, stopping the leading runners, so as to keep the plants close, and the ridges completely filled up. In earthing up the hills of melons, one or two of the frames or pits may now be spawned for mushrooms; these will produce their crop in the autumn. Take up garlic, potato onions, romasole, and shallots, when the leaves begin to decay, and lay them on mats in an airy place to dry.—*Lindley's Guide to the Orchard and Kitchen Garden.*

CURIOUS ANECDOTES
OF BIRMINGHAM MANUFACTURERS AND
MANUFACTURES.

"BIRMINGHAM (says the late Mr William Hutton, in his history of this large and populous town) began with the productions of the anvil, and probably will end with them. The sons of the hammer were once her chief inhabitants; but that great crowd of artists is now lost in a greater. Genius seems to increase with multitude. Part of the riches, extension, and improvement of Birmingham, are owing to the late John Taylor, Esq. who possessed the singular power of perceiving things as they really were. The spring and consequence of action were open to his view. He rose from minute beginnings to shine in the commercial, as Shakspeare did in the poetical, and Newton in the philosophical, hemisphere.

To this uncommon genius we owe the gilt button, the japanned and gilt snuff-boxes, with the numerous race of enamels. From the same fountain issued the painted snuff-box, at which one servant earned three pounds ten shillings per week, by painting them at a farthing each. In his shops were weekly manufactured, buttons to the amount of L.800, exclusive of other valuable productions. One of the present nobility, of distinguished taste, examining the works with the master, purchased some of the articles; among others, a toy of eighty guineas value; and while paying for them, observed with a smile, 'he plainly saw he could not reside in Birmingham for less than two hundred pounds a day.' Mr Taylor died in 1775, at the age of sixty-four, after acquiring a fortune of L.200,000.

BUTTONS.

This beautiful ornament appears with infinite variation; and though the original date is rather uncertain, yet we well remember the long coats of our grandfathers covered with half a gross of high tops, and the cloaks of our grandmothers ornamented with a horn button nearly the size of a crown piece, a watch, or a John-apple, curiously wrought, as having passed through the Birmingham press.

Though the common round button keeps on with the steady pace of the day, yet we sometimes see the oval, the square, the pea, the concave, and the pyramid, flash into existence. In some branches of traffic the wearer calls loudly for new fashions; but in this, the fashions tread upon each other, and crowd upon the wearer. The consumption of this article is astonishing; the value in 1781 was from threepence a gross to one hundred and forty guineas.

In 1818, the art of gilding buttons had arrived at such a degree of refinement in Birmingham, that threepence worth of gold was made to cover a gross of buttons; these were sold at a price proportionably

low. The experiment has been tried to produce gilt buttons *without any gold*; but it was found not to answer, the manufacturer losing more in the consumption than he saved in the material. There seems, says Mr Hutton, to be hidden treasures couched within this magic circle, known only to a few, who extract prodigious fortunes out of this useful toy, whilst a far greater number submit to a statute of bankruptcy. Trade, like a restive horse, can rarely be managed; for where one is carried to the end of a successful journey, many are thrown off by the way.

BUCKLES.

Perhaps the shoe, in one form or other, is nearly as ancient as the foot. It originally appeared under the name of sandal; this was no other than a sole without an upper leather. That fashion has been since inverted, and we have sometimes seen an upper leather nearly without a sole. But whatever was the cut of the shoe, it always demanded a fastening. Under the house of Plantagenet, the shoe shot horizontally from the foot, like a Dutch skate, to an enormous length; so that the extremity was fastened to the knee sometimes with a silver chain, a silk lace, or even a pack-thread string, rather than avoid genteel taste.

This thriving beak drew the attention of the legislature, which determined to prune the exorbitant shoot; for, in 1465, we find an order of council, prohibiting the growth of the shoe-toe beyond two inches, under the penalty of a dreadful curse from the priest—and, what was worse, the payment of twenty shillings to the king.

This fashion, like every other, gave way to time; and, in its stead, the rose began to bud upon the foot, which, under the house of Tudor, opened in great perfection. No shoe was fashionable without being fastened with a full-blown rose. Ribbons of every colour, except white, the emblem of the depressed house of York, were had in esteem; but the red, like the house of Lancaster, held the pre-eminence. Under the house of Stuart the rose withered, which gave rise to the shoe-string. The beaux of that age ornamented their lower tier with double laces of silk, tagged with silver, and the extremities were beautified with a small fringe of the same metal. The inferior class wore laces of plain silk, linen, or even a thong of leather; which last is yet to be met with in the humble plains of rural life.

The revolution was remarkable for the introduction of William, of liberty, and the minute buckle, not differing much in size and shape from the horse bean.

This offspring of fancy, like the clouds, is ever changing. The fashion of to-day is thrown into the casting pot to-morrow.

The buckle seems to have undergone every figure, size, and shape of geometrical invention. It has passed through every form in Euclid. The large square buckle, plated with silver, was the *ton* of 1781. The ladies also adopted the reigning taste; it was difficult to discover their beautiful little feet, covered with an enormous shield of buckle; and we wonder to see the active motion under the massive load. In 1812, the whole generation of fashions, in the buckle line, was extinct; a buckle was not to be found on a female foot, nor upon any foot except that of old age.

GUNS.

King William was once lamenting, 'that guns were not manufactured in his dominions, but that he was obliged to procure them from Holland, at a great expense, and with great difficulty.' Sir Richard Newdigate, one of the members for the county, being present, told the king, 'that genius resided in Warwickshire, and that he thought his constituents would answer his majesty's wishes.' The king was pleased with the remark, and the member posted to Birmingham. Upon application to a person in Digbeth, the pattern was executed with precision, and, when presented to the royal board, gave entire satisfaction. Orders were immediately issued for large numbers, which have been so frequently repeated, that they never lost their road; and the ingenious artists were so amply rewarded, that they have rolled in their carriages to this day.

It seems that the word 'London' marked upon guns is a better passport than the word 'Birmingham'; and the Birmingham gun-makers had long been in the habit of marking their goods as being made in London.

In 1813, some of the principal gun-makers of London brought a bill into the House of Commons to oblige every manufacturer of fire-arms to mark them with his real name and place of abode. The Birmingham gun-makers took the alarm, petitioned the house against the bill, and thirty-two gun-makers instantly subscribed six hundred and fifty pounds to defray the expense of opposing it. They represented that they made the component parts of the London guns, which differed from theirs only in being put together and marked in the metropolises.

Government authorised the gun-makers of Birmingham to erect a proof-house of their own, with wardens and a proof master; and allowed them to decorate their guns with the ensigns of royalty. All fire-arms manufactured in Birmingham and its vicinity are subjected to the proof required by the Board of Ordnance; the expense is not to exceed one shilling each piece; and the neglect of proving is attended with a penalty not exceeding twenty pounds.

STEEL.

The manufacture of iron, in Birmingham, is ancient beyond research : that of steel is of modern date. This art appeared at Birmingham in the seventeenth century, and was introduced by the family of Kettle. The name of Steelhouse-lane will convey to posterity the situation of the works; the commercial spirit of Birmingham will convey the produce to the antipodes. From the warm but dismal climate of this town issues the button which shines on the breast, and the bayonet intended to pierce it; the lancet which bleeds the man, and the rowel the horse; the lock which preserves the beloved bottle, and the screw to uncork it; the needle, equally obedient to the thimble and the pole.

BRASS WORKS.

The manufacture of brass was introduced into Birmingham by the family of Turner about 1740. They erected those works at the south end of Coleshill Street, then near two hundred yards beyond the buildings, but now the buildings extend half a mile beyond them. Brass is an object of some magnitude in the trades of Birmingham; the consumption is said to be a thousand tons per annum. The manufacture of this useful article had long been in the hands of few and opulent men, who, instead of making the humble bow for favours received, acted with despotic sovereignty, established their own laws, chose their customers, directed the price, and governed the market. In 1780 the article rose, either through caprice or necessity, perhaps the former, from seventy-two pounds a ton to eighty-four pounds. The result was, an advance upon the goods manufactured, followed by a number of counter-orders, and a stagnation of business.

In 1781, a person, from affection to the user, or resentment to the maker, perhaps the latter, harangued the public in the weekly papers, censured the arbitrary measures of the brazen sovereigns, showed their dangerous influence over the trades of the town, and the easy manner in which works of our own might be constructed. Good often arises out of evil: this fiery match quickly kindled another furnace in Birmingham. Public meetings were advertised, a committee appointed, and subscriptions opened to fill two hundred shares, of one hundred pounds each, which was deemed a sufficient capital; each proprietor of a share to purchase one ton of brass annually. Works were immediately erected upon the banks of the canal, for the advantage of water carriage, and the whole was conducted with the true spirit of Birmingham freedom.

The old companies, which we may justly consider the directors of a South Sea bubble in miniature, sunk the price from eighty-four pounds to fifty-six pounds. Two inferences arise from this measure; that their profits were once very high, or were now very low; and that, like some former monarchs in the abuse of power, they repented one day too late.

NAILS.

The art of nail-making is one of the most ancient in Birmingham. It is not, however, so much a trade in as of Birmingham, for there are but few nail-makers left in the town; the nailers are chiefly masters, and rather opulent. The manufacturers are so scattered round the country, that we cannot travel far in any direction out of the sound of the nail-hammer. Birmingham, like a powerful magnet, draws the produce of the anvil to herself.

When I first approached Birmingham (says Mr Hutton) from Walsall, in 1741, I was surprised at the prodigious number of blacksmiths' shops upon the road, and could not conceive how a country, though populous, could support so many people of the same occupation. In some of these shops I observed one or more females strip of their upper garment, and not overcharged with their lower, wielding the hammer with all the grace of the sex. The beauties of their face were rather eclipsed by the smut of the anvil. Struck with the novelty, I inquired 'Whether the ladies of this country shod horses?' but was answered with a smile, 'They are nailers.'

THE ADIEU.

Written in 1808, by LORD BYRON, under the impression that he would soon die.

Adieu, thou Hill! where early joy
Spread roses o'er my brow;
Where Science seeks each loitering boy
With knowledge to endow.
Adieu, my youthful friends or foes,
Partners of former bliss or woes;
No more through Ida's paths we stray,
Soon must I share the gloomy cave,
Whose ever-slumbering inmates dwell
Unconscious of the day.

Adieu, ye hoary Regal Fanes,
Ye spires of Granta's vale,
Where Learning robed in sable reigns,
And Melancholy pines.
Ye comrades of the jovial hour,
Ye tenants of the classic bower,
On Cama's verdant margin placed,
Adieu! while memory still is mine,
For, offerings on Oblivion's shrine,
These scenes must be effaced.

Adieu, ye mountains of the clime
Where grew my youthful years:
Where Loch na Gairt in snows sublime
His giant summit rears.
Why did my childhood wander forth
From you, ye regions of the North,
With sons of pride to roam?
Why did I quit my Highland cave,
Marr's dusky heath, and Dee's clear wave,
To seek a Southern home?

Home of my sires! a long farewell—
Yet why to thee adieu?

Thy vaults will echo back my knell,
Thy towers my tomb will view;
The faulting tongue which sung thy fall,
And former glories of thy hall,
Forgets its wonted simple note;
But yet the lyre retains the strings,
And sometimes, on Æolian wings,
In dying strains may float.

Fields which surround yon rustic cot,
While yet I linger here,
Adieu! you are not now forgot,
To retrospect, do I retire;
Streamlet! along whose rippling surge
My youthful limbs were wont to urge
At noontide heat their piliant course,
Plunging with ardour from the shore,
Thy springs will have these limbs no more,
Deprived of active force.

And shall I here forget the scene
Still nearest to my breast?
Rocks rise, and rivers roll between
The spot which once my bosom blest;
Yet, Mary, all thy beauties seen
Fresh as in love's bewitching dream,
To me in smiles display'd:
Till slow disease resigns his prey
To Death, the parent of decay,
Thine image cannot fade.

And thou, my friend! whose gentle love
Yet thrills my bosom's chords,
How much thy friendship was above
Description's power of words!
Still near my breast, thy girl I wear,
Which sparkled once with Feeling's tear,
Of love the pure, the sacred gem;
Our souls were equal, and our lot
In that dear moment quite forgot;
Let Pride alone condemn!

All, all is dark and cheerless now!
No smile of love's deceit
Can warm my veins with wonted glow,
Can bid life's pulses beat:
Not e'en the hope of future fame
Can wake my faint, exhausted frame,
Or crown with fancied wreaths my head.
Mine is a short inglorious race—
To humble in the dust my page,
And mingle with the dead!

Fame! thou goddess of my heart,
On him who gains thy praise
Pointless must fall the spectre's dart,
Consumed in glory's blaze;
But me she beckons from the earth,
My name obscure, unmark'd my birth,
My life a short and vulgar dream;
Lost in the dull, ignoble crowd,
My hopes recline within a shroud,
My fate is Lethe's stream.

When I repose beneath the sod,
Unheeded in the clay,
Where once my playful footsteps trod,
Where now my head must lay;
The meed of Pity will be shed
In dew-drops o'er my narrow bed,
By nighties skies and storms alone;
No mortal eye will deign to steep
With tears the dark sepulchral deep
Which hides a name unknown.

Forget this world, my restless sprite,
Turn, turn thy thoughts to heaven;
There must thou soon direct thy flight,
If errors are forgiven.
To bigots and to sects unknown,
Bow down beneath the Almighty's throne;
To Him address thy trembling prayer;
He, who is merciful and just,
Will not reject a child of dust,
Although his meaneast care.

Father of light! to Thee I call,
My soul is dark within;
Thou, who canst mark the sparrow's fall,
Avert the death of sin.
Thou, who canst guide the wandering star,
Who calms't the elemental war,
Whose mantle is yon boundless sky,
My thoughts, my words, my crimes forgive;
And, since I soon must cease to live,
Instruct me how to die.

EXPEDITION OF JAMES V. AGAINST THE BORDER THIEVES.

THE remarkable expedition of James V., in the year 1529, into the southern Highlands of Scotland, to inflict judicial punishment on the marauders of these border districts, furnishes various amusing anecdotes, illustrative of the state of society in the sixteenth century. Having very sagaciously, as a first step, secured in safe custody the principal chieftains by whom the disorders were privately encouraged, namely, the Earl of Bothwell, the Lord Home, Lord Maxwell, Scott of Buccleuch, and Ker of Fernyherst, James assembled an army, and set out under the pretence of enjoying the pastime of hunting. The track which the king and his retinue pursued led him first through the western part of Peebleshire, from whence he made a detour to the left, through Ettrick and Ewesdale. It is ascertained, by tradition, that, in penetrating the wilds in the upper part of Tweeddale, he felt himself very much at a loss to discover the proper path into the vale of Drummelzier. It is supposed that the main body of his attendants was sent up the strath of Manor Water, while he and a few retainers made a stretch westward, through the demesnes of Sir James Tweedie, a thane of considerable power in this quarter at the time, who resided in a strong peel-house, called the Thane's Castle, near Drummelzier, and the ruin of which is still extant, on the point of a steep conical rock. Here the chief of the Tweedies used to reside, and domineer over the adjacent region. He was likewise in the habit of exacting a species of court by persons passing his fastness, in much the same way that the petty princes of Africa oblige travellers to wait upon them, either to gratify their love of power or plunder. The king having required a guide through the district of the Tweedies, a poor labouring man of the name of Bartram offered himself, and was accepted. This person assiduously escorted him from near the Rachan to Glenwhappen, through the vale commanded by Tweedie's castle, and so well was James pleased with his attention, that he granted him a freehold property, called Duck-pool, in the parish of Glenholm. It is somewhat curious that the lineal descendant of this Bartram still possesses a portion of the estate so conferred. In the course of three hundred years it has been much reduced in size, as much from the aggressions of the more powerful lairds as from the necessities of the family. Its dimensions are now to the extent of little more

than an acre, yet it acknowledges no superior, and, from the peculiarity of the tenure, pays no tax or assessment.

The thane of Drummelzier having been informed that a stranger, evidently of some note, had passed his mansion without paying the wonted obedience to its lordly owner, or craving his hospitality, pursued the king with sixteen attendants, uniformly arrayed, and mounted on white horses, to Glenwhappen; where, having found the refugee among his friends assembled, he imperiously demanded corporal satisfaction for this ideal affront; whereupon the king discovered himself, brought the proud Sir James on his knees for pardon, which, it is mentioned, was more readily granted by the king than forgiven by the thane.

The king having shortly fallen in with his troops, proceeded onward to the tower of Henderland, standing near the mouth of the river Meggat, which falls into the pretty little lake of St Mary, in Selkirkshire. This fastness was the habitation of a person of the name of Piers Cockburne, who was noted for the great extent of his depredations. Not having been made aware of the approach of royalty, or the purposes of such an expedition, he and his family were encompassed and seized unawares. Tradition tells that they were sitting at dinner when their gate was surprised. James's impetuous temper seems to have dictated that execution should follow rapidly on trial and condemnation, or rather upon accusation. Cockburne's wife and family were glad to be permitted to make their escape in opposite directions. The freebooter was himself instantly pinioned, and hanged over the gate of his own tower. While the execution was going forward, the unhappy wife of Cockburne took refuge in the recesses of the rocky bed of Henderland Burn, which passes near the site of the castle. Here she is said to have striven to drown, amid the roar of a foaming cataract, the tumultuous noise which announced the close of her husband's existence. By the ballad of "The Border Widow," which is supposed to apply to this incident, it appears that she ventured out after the deed was perpetrated, and took charge of the corpse. The words she is understood to utter are very affecting:—

"I sew'd his sheet, making my mane;
I watched the corpse, myself alone;
I watched his body night and day;
No living creature came that way.

I took his body on my back,
And whiles I gazed and whiles I satte
I digged a grave, and laid him in,
And happ'd him with the sod sea green."

After the execution of Cockburne of Henderland, James marched rapidly forward, to surprise in a similar manner Adam Scott of Tushielaw, called the King of the Border, and sometimes the King of Thieves. A path through the mountains, which separates the vale of Ettrick from the head of Yarrow, is still called the King's Road, and seems to have been the route which he followed. Tushielaw was a tower, or peel-house now in ruins, overhanging the wild banks of the Ettrick. Here the same feat was performed. It is understood that other executions followed this, but of these none was of so bold a character as the killing of the famous Johnnie Armstrong of Gilnockie.

Johnnie Armstrong is a noted person both in history and tradition. He appears to have been a border depredator on a singularly magnificent scale. His tower is still extant. It occupies a pleasant situation among the bewildering beauties of Eskdale, in the south-eastern part of Dumfriesshire, and within an hour's ride of the Cumberland side of the border. It is of considerable extent and space, though now only serving in the capacity of a cow-house to the neighbouring farmer. There is now reason to believe that Johnnie, the proprietor of this castle, and the head of a potent clan of Armstrongs, was not ignorant of the exterminating principles which actuated the king. It is rather evident that he had determined on braving it out before "his grace." As the sovereign proceeded down the vale of the Ewes towards Langholm, the freebooter presented himself before him with "a gallant company" of thirty-six well-mounted Elliots and Armstrongs, arrayed in all the pomp of border chivalry. The spot at which the meeting took place was at Castlegigg, about three miles south of Hawick. It turned out that Johnnie had entirely misapprehended the king, and likely to be produced by the imposing appearance of his train. The king was incensed to see a freebooter so gallantly equipped, and commanded him instantly to be led to execution, saying, "what wants this knave, save a crown, to be as magnificent as a king." On this John Armstrong made earnest entreaty for his life, offering, at first poll, four-and-twenty milk-white steeds, and afterwards increasing his ransom in amount to twenty-five, for "enging mills," with as much "gude red wheat" as would keep them in grudging for a whole year; but all was of no avail. He, as a last shift, offered to maintain himself with fifty men, ready to serve the king at a moment's notice, at his own expense; engaging never to hurt or injure any Scottish subject, as, indeed, had never been his practice; and undertaking that there was not a man in England, of whatever degree, duke, earl, lord, or baron, but he would engage, within a certain time, to present to the king, dead or alive. But the king would listen to no offer, however great, whereupon John broke out into a fume of proud indignation, and, as the ballad has it, exclaimed,

"To seek het water aneath could ice,
Surely it is a great folie;
I have asked grace at a graceless face,
But there is nae for my men and me."

continuing, that, had he anticipated such usage, he would have lived on the borders in despite of both King Harry and James, and that the former would downweigh his best horse with gold to know that he had been put to death. No farther parley took place. Johnnie and all his retinue were immediately hanged upon some growing trees near the above-mentioned chapel. They were buried in its deserted churchyard, where their graves are yet shown. The country people, who hold the memory of the unfortunate marauders in very high respect, believe that, to manifest the injustice of their execution, the trees immediately withered away.

WINTER GARDENS IN PRUSSIA.

At Berlin there are four extensive winter gardens, in which the appearance of a perpetual summer is kept up. They are simply large greenhouses, or orangeries, with paved floors, a lofty ceiling, and upright windows in front—the air heated by stoves, supplied with fuel from without. On the floor are placed here and there large orange trees, myrtles, and various New Holland plants in boxes. Round the stems of the trees tables are formed, which are used for refreshments for the guests, and for pamphlets and newspapers. There are also clumps of trees and flowering plants, and sometimes pine apples and fruit trees. The gardens abound with moveable tables and seats, and there is generally music, a writer of poetry, a reader, a lecturer; short plays have even been acted in them on the borders of the evening. In the evening the illumination is on certain days of the week the music and illumination is on a grander scale. In some of these orangeries there are separate saloons for billiards, for ladies who object to the smoke of tobacco, for cards, and select parties. In the morning part of the day the gardens are chiefly resorted to by old gentlemen, who read the papers, talk politics, and drink coffee. In the evening they are crowded by ladies and gentlemen, and refreshments of various kinds are taken; and it is quite common for company to call in after the play to meet their friends, or take refreshments. There is nothing of the kind in any other country of Europe to be compared to those gardens. —*Time's Telescope for 1830*

EDINBURGH: Published, weekly, by W. and R. CHAMBERS, 19, Waterloo Place; ORR & SMITH, Paternoster-row, London; and GEORGE YOUNG, Dublin. Agent in Glasgow, JOHN MACLEOD, 20, Argyle Street; and sold by all other Booksellers in Great Britain and Ireland.

Subscribers in town may have the paper left at their houses every Saturday morning, by giving the address at 15, Waterloo Place. Price of a quarter of twelve weeks, 1s. 6s.; of a half year of twenty-four weeks, 3s.; and of a year, 6s. 6d. In every case payable in advance.

From the Steam-Press of W. and R. CHAMBERS.

EDINBURGH CHAMBERS' JOURNAL

CONDUCTED BY WILLIAM CHAMBERS, AUTHOR OF "THE BOOK OF SCOTLAND," &c., AND BY ROBERT CHAMBERS, AUTHOR OF "TRADITIONS OF EDINBURGH," "PICTURE OF SCOTLAND," &c.

No. 24.

SATURDAY, JULY 14, 1832.

PRICE THREE HALFPENCE.

RECOGNITIONS.

"Dignus vindice nodus."

If you be a person that have lived for a long time in any large town, you must have ere this felt the dreadful inconvenience of knowing and being known by every body. The courtesy of society demands that, on meeting any one in the street, of whom you have the slightest acquaintance, you must *not* "affect to nod," like Alexander, but give a real *bona fide* nod, or, if you please, a bow, as a mark of respect or regard—a practice which leads to a thousand disagreeable sensations in the day, till at last you almost resolve that your progress shall be like that of a British war-chariot—cutting right and left, without regard to man, woman, or child. It is not that you have any abstract disinclination to pay this tribute to friendship: it is the frequency and the iteration of the thing that annoys you. You could tolerate, perhaps, a certain number of nods in the day—I would willingly compound for twenty—and it would be all very well if you only met a friend on the street once in the month or so. But this is not the way of it: you cannot be abroad two hours (supposing that you are of long standing in the town) without meeting fifty people and upwards, to whom you must "vail your haughty head," and, what is worst of all, the half of these are people whom you met and nodded to yesterday, and the day before, and every day before that again, back to the creation of the world. With many of these persons, your acquaintance at first was of the very slightest nature. You met the man in a steam-boat, and had your respective names mentioned by a friend. You left a room one day as he was entering, and you were introduced, and, after exchanging only three words, made a friendly bow to each other, and parted. Perhaps he was introduced to you passingly on the street by some person to whom you had been introduced several years before, in the same transient way, by an individual whose acquaintance of you was originally of so slight a character that you had even then forgot for some years how it commenced. Your reminiscences upon the whole subject are a Generation of Shadows, traced back to Nothing. Possibly you sat next to him one night "Console Planco," at a mason lodge, and to this blessed hour have never so much as learned his name. When it happens that you do not see or meet these acquaintances for six months after your first rencontre, the affair has by that time got cool enough to justify you mutually in cutting each other. But in most cases it happens quite differently. On the very morning, perhaps, after having scraped acquaintance with a merry fellow in some promiscuous company, you meet him going abroad, like yourself, to his place of business. As nothing of the world, or its concerns, has as yet got between you and your recollections of last night's conviviality, you pull up with him for a minute, shake hands, laugh cordially in each other's faces, hope each other is quite well after yesternight's business, remark what a deal of fun there was, what a deuced funny fellow that was who sung the comic songs, and so forth; and then, with another cordial shake of each other's hands, you part off, each to the serious duties of the day. Unfortunately it happens that this new acquaintance of yours has to go to his place of business exactly at the same time in the morning with yourself, and that your places of residence and business are co-relatively in opposite situations. It is, therefore, your doom to cross each other's path regularly every morning at ten minutes before ten, for all the rest of your natural lives. Your eyes begin to open upon this appalling fact on the second day. You meet your man *then*, exactly at the same spot as on the morning before; when, the conviviality of the penult evening being totally spent, both in respect of its effect on your mind, and as a subject of conversation, you stand in an agony of a minute's duration talking to each other of you know not what, till, fortunately, perhaps, a friend comes up who is going your way, and you hook yourself upon him, and take a hurried leave of your new acquaintance. Next morning you content yourself with shaking your friend by the hand cordially without stopping. Next morning, again, the affair has degenerated into a laughing nod. Next, it is an ordinary nod; at which point it continues ever after, till it is evident to both of you, as you approach each other, that you are beginning to be fairly tired of existence, and wish, mutually, that it were all well over with you, so far

as this breathing world is concerned, and the whole affair hushed up in the silence of the grave.

It is not alone in the monotony of this system of recognition that the misery lies. You are also put to a great deal of pain and difficulty, in many cases, by the rank of the individuals to be recognised. Every man of the world has occasion to be brought into contact now and then with persons superior to himself, but who do not scruple to make themselves familiar with him in his own house or place of business. Now, the plague is, how to treat these people on the street. If their rank be very far above your own, the case is comparatively easy, for a bow, with an elevation of the hat, is readily awarded on your part, and graciously received on his. But should his place in society be just a little above your own, or such as you expect to attain very speedily—or should he be just a little longer started in the general race of prosperity than yourself—then it is perplexing indeed. Man has no antipathy to the brother worms who are so far beneath his own level as never to be brought into contrast with him. A nobleman is quite at his ease with his tailor. But it is very different with the individuals who are just a little lower than ourselves, and liable to be confounded with us. We could tolerate the *profanum et ignobile vulgus* itself, rather than the people whose manners and circumstances in life are but one step beneath our own. Hence, one is liable to perpetual grievances on the street, through, what he thinks, the forwardness of some people, and the haughtiness of others. Alternately cutting and cut, on he goes, in a state of unhappiness beyond all description. Sometimes he avoids recognising, through fear of its being offensive, a person who was fondly anxious to have his nod, and takes it very ill that he does not get it. Sometimes he is in the reverse predicament, and proffers a condescending bow, or intends to do so, to one who, putting quite a different construction on their respective degrees of consequence, coolly overlooks him.

In short, what with one thing and another, walking on the street is an exceedingly disagreeable exercise. For my part, having been long connected with the city I inhabit, I am obliged to take a thousand ingenious expedients in order to get along with any degree of comfort. For one thing, I would sooner walk some miles barefooted over broken glass, than parade on the principal streets of the city at high twelve. If I were to attempt a passage that way, I might go as I have been told Oechsenschlager the Danish poet does through the streets of Copenhagen, my hat in my hand, and my body in a perpetual inclination. I have to seek all possible kinds of by-ways, through alleys profound and obscure; and when I cross a thoroughfare, it is with the same dogged straightforward look with which a man swims across a dangerous river. When I do happen, in a moment of facility or confidence, to venture upon an open street, I have all kinds of expedients for avoiding and diminishing the pains of recognition. When you see an acquaintance approaching, you must consider the relative circumstances. Much depends on the place of meeting—much on the time—much on the crowded or empty state of the streets, and much, of course, on the degree of your intimacy with him, and the distance of time since you last met. If it be a vacant street, and not a business time of the day, and six months since you last met him, you are in for a quarter of an hour's palaver as sure as you live, and hardly even a parting *then*, unless you can either of you manage to get up a good witticism, under cover of which you may escape. If the street be crowded, and the time a busy one, you are tolerably safe, even although it should have been a twelvemonth since you met before. In this case, you fly past with a hurried nod, which seems to say, "We are busy just now, but will have another opportunity of stopping to speak." This is a nod of adjournment, as it were, and it is one of great satisfaction to both parties, for both argue, of course—though they don't put that into the nod—that, as it is a twelvemonth since they last met, it may be another before they meet again. Should you meet a man in a vacant street, even in the busiest part of the day, then the former circumstance annuls the latter, and you must stand and deliver, even although you be too late for an appointment of the most interesting character. On the other hand, if you meet your man in the leisurely part of the day, in a crowded street, you get off with a nod, pretending

to yourself that you are carried away by the current. Sometimes you may not take advantage of your good fortune in this last case, but so bring it about that you get into collision with your friend, and begin a conversation. In this case, even although you have only asked him how he does—not caring in the least what he has to answer—and though you positively have not another idea to interchange with him, he finds it necessary to disengage himself from the throng in order to reply. You now get upon the curb-stone, or upon the causeway, where, of course, you have no more advantage from the crowded state of the street than a fish has of a river after it has been thrown upon the bank. You are now in the same predicament as if you had met your friend in the same cool part of the day in a perfectly empty street, and therefore when he has answered your precious question as to his health, you are as fairly in for a quarter of an hour of wretched, bald, wishy-washy conversation about all kinds of nothings that you don't care one farthing about, as ever you were in your life. The only thing that can now save you is either a joke to laugh yourselves asunder upon, a crowd raised at a distant part of the street by some such matter as a child ridden over by a coach, or else, what is not a bad means of separation, though sometimes dangerous, you cut off one grievous encumbrance by taking on another; that is, you see another friend coming up your way, and, pretending you have something to say to him, shake off the old love and take on with the new: in which case it is not improbable that you spend longer time at the end of the street with this last individual than you might have had to spend with the former one if you had continued with him, and only given the other man a passing nod—but, of course, that is all the fortune of war, and, having done what seemed best under the circumstances, you must rather blame fate than your own imprudence. Consider well, however, in such a case, whether you are likely to get soonest off with the new or the old love; for if you take on with a bore of ten minutes' power, in order to get off with one of only five, merely because he is going your way, and promises no interruption in the first instance, you may only fall into Scylla, seeking to avoid Charybdis.

After all, as in every matter arising from the affairs of this world, a great deal of our happiness, so far as it is concerned by the system of recognition, lies with ourselves. If we are prudent, and take counsel from experience, we may avoid much of this nodding and bowing misery which would otherwise fall to our share. A man, for instance, should not be always goggling and staring about him; otherwise he will be sure to fall in with flying nods, which he could as well dispense with, if he does not even hit some person perhaps, on the other side of the way, who, not having seen him for a long time, thinks it his duty—Lord confound him!—to come across the Hellespont of mud, and shake the spirits out of him with half an hour of tediousness and commonplace. When you debouch from your door, never look along the street in the direction you are not to travel, or ten to one but you see some one who, having the infelicity, poor devil, to catch your eye, must put himself on to a canter to come up to you; and so you get mutually entangled, perhaps for half the day. I give this caution with a particular emphasis; for I have observed that nine out of every ten men look back in the way described, as if it were one of the involuntary motions or inclinations of human nature. As you are walking along, never cast your regards upon any one coming obliquely across the street, or in all probability you are shot dead by an eye of your acquaintance, which, if it had not hit you, would have passed on innocuous. The eye is the principal mischief in all these cases. A man is often snared by that part of him, and dragged a hundred yards along a dirty street, for all the world like a silly salmon hooked by the nose, and laid, after half a mile of tugging and hauling, exhausted on the shore. Keep your eye well to yourself, and you are tolerably safe; for of this you may be assured, no man will come up to attract your attention, unless he be a country cousin, who was just looking about for you. Every mother's son of them is actuated by the same principles with yourself, and is glad to escape all the nodding he can. So reciprocal is this feeling, that many persons whom you are taking means to avoid, will, if you observe them narrowly, be found to be doing all they can to assist in the process. If you pretend, for in-

stance, that you cannot see that gentleman there coming aslant the way, on account of the intense brightness of the sun, you will see out at the tail of your eye that he is pretending to be as much put about by the sunshine as yourself, and is doing all he can to shade his eyes from Phoebus and you, exactly in the same fashion as yourself. If you walk, as you ought to do, with your eyes fixed below what painters call the point of sight, but suddenly raise them for a moment, in order to look about you, it is ten to one but you see your very bosom friend—your confessor—the man whom you wear in your heart of hearts—in the act of sneakily withdrawing his eye from your countenance, for the purpose of getting past you unnoticed. Take no scorn on account of these things, but put it all down rather to the strength of friendship; for can there be any stronger test of that sentiment, than the desire of saving those whom we love from any thing that is disagreeable to them?

It has been already remarked, that if you be in the regular habit of meeting and nodding to a person every now and then, the system is kept up till death do you part. On the other hand, if you can avoid seeing a person for some considerable time, the nod becomes *effete*, and you ever after see, as if you saw not, each other. Sometimes, however, one gets a great relief in the midst of a fixed and hopeless nodding acquaintance, by happening to meet once more at the social board in some friend's house, when you re-invigorate the principle, gather fresh intimacy, and perhaps, after all, take refuge from the unnecessary monotony of nodding terms in a serious friendship.

If you can help yourself by this means, it may be all very well, though certainly it is rather hard that one should be forced into an intimacy with a man merely because he crosses your path rather oftener than the most of your other slight acquaintances. The best way, however, to lessen this part of the evils of life is to walk with as *little circumspection as possible*. So ends my preaching about RECOGNITIONS.

POPULAR INFORMATION ON NATIONAL INSTITUTIONS.

BANKING INSTITUTIONS.—Continued.

HAVING in a previous paper detailed the establishment of Banks in Scotland, some account may now be given of the nature of the business they transact, and the influence of their paper money on the country.

The Scottish banks are chiefly distinguished as a species of agency betwixt lenders and borrowers. They receive deposits of any sum above £10, for which they give a regular interest, negotiate bills, occasionally lend money on heritable property, and effect cash accounts. With the capital not employed in any of these branches of business, they sometimes speculate in purchasing government stock. By a cash account is signified a process, whereby an individual, on entering into an arrangement with a bank, is entitled to draw out sums as required to a stipulated amount, and by an implied condition to make deposits at his convenience towards the liquidation of the same. Practices of this nature arose out of the wants of tradesmen, and the general impoverished condition of the country. Some of our readers may perhaps remember a scheme projected by Benjamin Franklin, for the institution of a process of giving small loans to industrious but indigent young men beginning business, with the obligation to pay them back at stated times with interest. This philanthropic idea, which arose in the mind of the American philosopher, from his own wants in the outset of his career as a printer, has been in some measure acted upon in Scotland. The process was in existence for more than half a century prior to the period at which Franklin wrote, though he certainly was not aware of the fact, otherwise he would have warmly patronised its introduction into Philadelphia, and other American towns.

It is now a hundred and three years since the first cash credit was instituted; and it is related that the custom arose in the following accidental manner:—A metropolitan shopkeeper, in the year 1729, found himself at times in the possession of more than a sufficient supply of ready money to carry on his trade, the overplus of which he consigned to the care of the neighbouring bank. But on other occasions, by reason of the length of the credits given to his customers, his money became so scarce, that, after exhausting his bank deposits, he still felt himself in difficulties. Several dilemmas of this kind having occurred, and being averse to resort to the insecure practice of accommodation bills, he was prompted to make a proposal of a novel nature to the bank; to the effect that, if it would accommodate him in straits with small loans, he would always shortly afterwards make up such debts, and that the parties should come to a balancing of accounts at periodical intervals. It seems this novel plan was acceded to. A cash credit, or liberty to draw to a certain extent, was instituted under securities; and thus originated a system which has been of immense benefit to bankers and traders, and is now followed over the whole of Scotland.

Cash credits are guaranteed by two sufficient securities, or the applicants give infeffment to heritable property in caution of the contingent debt—a special act of Parliament having been passed to allow this to be done—and when any such debt is liquidated, the deed is cancelled. The expense of expending a cash credit varies according to the amount of the desired loan. One for £500 may be stated at about £15. The deed requires no renewal; and although attended with a heavy outlay at first, the price is perhaps not more than what would soon be swallowed up by stamps for bills. Besides, this mode of borrowing is every way more secure than the discounting of bills; while the circumstance of commanding ready money to a certain extent at all times, gives a trader a great advantage in settling for his pur-

chases. At the end of every six, and in some cases twelve months, calculations are made of entries and debits; the interest for and against the bank—the one being a per cent. higher than the other—is added and balanced, and an account being then rendered, the balance, if in favour of the bank, is either paid up, or remains against the debtor at interest to his new account. In these cash credits, the borrower is always at the mercy of the bank, which can call upon him at any time to balance his account, or, by his failing to do so, have recourse upon his securities.

Since 1729, cash credits have increased to an extent hardly credible. In 1826, it was computed that there were TEN THOUSAND in Scotland, varying in amount from £100 to £5,000 each, but averaging from £200 to £500. Though originally designed for mercantile persons, they are now operated upon by farmers, manufacturers, house-builders, miners, lawyers, and all classes of traders and shopkeepers. From 1826, it is extremely probable, that, instead of decreasing, they have increased a thousand or two more.

No one can have a just conception of the extraordinary degree of stability of the Scottish banks, and of the secure manner in which their business is transacted, unless he were made acquainted with the laws relative to banking, and had examined the history of the country. Previous to the year 1765, the banks were bound by no regular statutes, and their mode of management resembled that in England a few years since. In that year an act of Parliament was passed, which is still considered the great charter of Scottish banking. Subsequent enactments, as well as judgments of the Supreme Courts, have strengthened and extended the code. The grand principle of security in the institutions, is the liability of shareholders for the debts of the establishment. They are liable not only for the amount of their own shares, but for the shares of all the others, and the whole of their property may be seized to make up deficiencies. Although many of the shareholders are certainly not men of opulence, a number are so; and as their fortunes are good for the paper issued, the public runs no risk of injury. To strengthen this liability of shareholders, by the law of Scotland all heritable property, lands and houses, may be seized in satisfaction for their debts. Now, this is not the case in England, where personal or moveable property can alone be taken by creditors. Hence it would be idle to talk of establishing banks in the south part of the island, on the principle of the Scottish banks, till the law touching heritable property be altered. In Scotland, the houses, lands, goods, money, and person of a debtor, can be seized simultaneously for debt, and without such a comprehensive course of action, its banking institutions would fall in pieces. Farther, powerful aid is given to this law, by the registration of all the mortgages on heritable property. This is done at a national establishment in Edinburgh, and in the course of a single day, the search can here be made which will make it quite evident whether bankers be men of real property, and whether that property be unencumbered.

Other causes, not of a legal nature, conspire to render the system of Scottish banking perfect. By reason of the circumscribed limits of Scotland, and the character of the people, a ramification of intelligence is created and preserved throughout the whole of society, altogether unknown in England, whereby the character, the wealthiness, and the conduct of the partners or directors of each bank, are made fully known to the rest. All seek, and all find, a knowledge of the management of each other. All are mutually on the watch; and symptoms of over issues or other improprieties are spread with an amazing celerity, and have their immediate effect. It is also the custom of the banks to exchange the notes of each other once or twice in a week, by which means the notes are sent very speedily back to the owners, and an over issue on the part of any particular establishment is prevented.

In comparing Scottish banking institutions with those in England, and considering the different manner in which paper money has been guided by the two nations, the uniform security of the former appears almost miraculous. From the first issue of the bank-notes in 1704, till the year 1830, a single panic or general run did not occur in Scotland, although, during at least two-thirds of the intervening period, paper money had been used to the almost total exclusion of a gold currency. During the insurrections of 1715–45, and during the panics in England of 1793–97, and 1825, no perceptible difference took place in the demand of specie for notes. When the Bank of England was reduced to the miserable expedient of protracting cash payments by laying down sixpences, none of the banks in this country experienced any excess of demand for gold or silver. Partial and very temporary runs have assuredly been felt from the effects of short-lived slander or mistaken notions, which have invariably been readily quashed; but in the course of a hundred and twenty-six years, there have only been two cases of banks failing to pay twenty shillings a pound (they paid 10s.) and four, in which, after a short suspension of payments, all demands were liquidated. In two of the latter, the notes were accepted almost immediately at other banks of the highest credit. These banks were all provincial, and had been injured by mismanagement. Their failure or stoppage, with the exceptions we mention, did not put the public to any loss, but this was on the ruin of the shareholders, many of whom were reduced from affluence to poverty.

It may safely be asserted that the above cases of insolvency of Scottish banks have not in the smallest degree shaken the public confidence in the good character of a paper currency, and can find no plea for traducing the institutions now under review. At this present moment the community feels, as it always has felt, that a bank-note is merely a convenient representative of its expressed value, and that this value can at all times be procured on demand. When such are the conventional ideas of paper money, and when the supposition of its real value is just, the exchange of notes for gold ceases to be an object of any consequence. In as far as the greater part of mankind have come to an understanding that a piece of

yellow metal is worth a certain price, so have the Scotch come to an agreement to consider a bit of paper, of a particular kind, capable of bringing a price fully as high; and it is difficult to see why such a notion should be disconcerted; for there is as much rationality in the one idea as the other. The note in Scotland is even liked better than a sovereign, which, when offered, is sometimes looked upon with suspicion as to its quality. A good metropolitan bank-note is always preferred: It is easier carried or sent by letter; and in case of loss, can more easily be recovered than a gold piece.

It is not going too far to say, that without bank-notes, Scotland at this day would have been very little advanced in any of the useful or elegant arts. Divested of such important auxiliaries, the poverty of the nation could in no respect have called into existence that quantity of solid wealth it is now possessed of. Unaided by paper money, it would have been altogether out of the power of the nation to compete with its neighbours, or act as a financial accessory in times of war or exigency; and even with its assistance, it is surprising how it has been able to pay its fair proportion of taxes. Looking back on the low condition of this northern kingdom for many years after the Union, and remembering the character of the soil and climate, it is obvious that, but for the help thrown out by banks to agriculturists and artizans, the country—scarcely cheered by English capital—must have continued long in a withering and gloomy condition. It required at that period little else than the temporary aid of money loans to commence its career of prosperity, or to give the first impetus towards improvement. In the absence, therefore, of the precious metals, the dissemination of paper as the representative of that species of national wealth, which, from its nature, was not susceptible of being put in circulation, was one of the most creditable, and eventually the most successful, devices ever fallen upon by any people to better their circumstances. It was not without much trouble, and a lapse of many years, that the system put in operation was perfected; but when the law at length interposed to secure the public, as well as the bankers, from contingent excesses, and defined the powers of lenders and borrowers, the triumph of the Scottish bank-notes was completed. It is more the task of a historian than the writer of these humble sketches, to describe methodically what has been accomplished by their judicious administration: A recitation of their achievements would involve the history of nearly all that has been transacted in Scotland since the revolution. Until they made their gladdening appearance, the footmarks of the strife of past ages remained unobliterated on the soil. Before their influence, agriculture, domestic and foreign trade and commerce, and every species of improvement in the arts, have been instituted and supported. Almost whole towns have been erected and tripled in size by their services, and the sea has been covered by them with vessels, which would otherwise have been growing in their native woods—in a word, nearly all that a stranger has to contemplate in Scotland, wherein art has been employed; every thing he sees around him, beyond things the most indifferent, has been directly or indirectly created and reared by the transcendent powers of paper money.

THE JUBILEE.

SOME years have elapsed (I am sometimes tempted to forget how many) since I endeavoured to compensate the deficiencies of a neglected education on my own side the Tweed, by voluntary studies at the University of Edinburgh. As a relaxation from severer pursuits, and an excuse for rambles in a country whose novelty alone was attraction enough to an untravelled Englishman, I occasionally accompanied a young artist of liberal education and pleasing manners, with whom I was acquainted, in his sketching expeditions in the romantic neighbourhood of his native city, the very contiguity of which to a great town rendered it more piquant and striking.

In one of these excursions, when, by the uncommon fineness of the weather and greater distance of the style of scenery requisite for his purpose, we were tempted to proceed beyond the brief limits of an autumnal day, instead of returning by the light of a rather waning moon to Edinburgh, G— proposed that we should take up our quarters for the night at a neat little mountain inn, much frequented at various seasons by fishers and grouse-shooters, and affording, in consequence, accommodations of a description its unpretending aspect would scarcely have led one to expect. On nearing this rustic hostelry, kept by an antique of the true Meg Dodds character, we were a good deal surprised to hear, issuing from its usually quiet haven, sounds of the most exuberant and unrestrained mirth, blending with, and nearly overpowering, the discordant strains of a brace of evidently belligerent fiddles.

"A penny wedding, by all that's lucky!" exclaimed my companion. "At least you, sir, as a stranger, will no doubt think one night's rest well sacrificed for a peep at these fast-waning saturnalia."

"Pray, explain," said I, delighted to witness, under any circumstances, so lively a scene of national festivity: "what do you mean by a 'penny wedding'?"

"Why, sir, in pastoral and primitive districts—which, strange to say, though within a dozen miles of a capital, these hills seem likely long to remain—when a couple, of the lowest order of course, are too poor to muster the sum requisite for marrying, their neighbours and acquaintance good-humouredly set on foot a subscription, out of which is first defrayed such a merry-making as you see going on yonder, while the surplus generally suffices to place the improvident pair beyond immediate want. It is not, you will say, a very eligible mode of settling in the world, nor is it so considered in these days, even among themselves.

It is generally, indeed, more a frolic of the neighbouring young people, at the expense of some pair of elderly paupers, determined to marry for *verse*, instead of better, than, as it once was, a creditable scheme of establishment for a deserving young couple."

As he spoke, we descended the green shoulder of one of the pastoral hills, whose recesses of unsuspected beauty we had been all day exploring, and came full upon the little inn, its front beaming with unwonted illumination, and steam—savory as the caldron of Meg Merrilies, amidst which my English organs readily detected the national perfume of "mountain dew"—issuing from every open door and window.

The fiddles, whose dismal scraping accorded ill with the accompaniments, might almost have been dispensed with, so completely were they drowned by yells and shrieks of frantic merriment, and so well was the time of the tune marked by the snapping of fingers and thumping of heels on the sanded floor of the kitchen. I scarcely know which expressed most surprise, my face, as I caught, over the shoulder of a tall, white-headed old Bluegown (the fac-simile of Edie Ochiltree), a glimpse of the scene within, or that of Luckie Cairns, the usually stayed and somewhat aristocratical hostess, when the nakedness of her, for once, disorderly house was discovered to a couple of stranger gentlemen. She soon, however, recognised her old acquaintance G—, and addressed to him—though with the tail of her eye all the time on the "Englisher"—her characteristic apology.

It began, *more Scotico*, with a question, and with what G— called "the first word o' flyin'."

"Lord guide's! Mr G—, what's brought you here the day, wi' your pents and your nick-nacks, and a stranger comrade wi' ye, that's used to things wise-like, nae doubt—and the house a' disjessit this gait, wi' the first and last play the callants e'er got me to countenance within my door? And they hadna hae gotten it now, but the silly body, Sanders, took it aye up and down wi' the gentles' fish to the carrier's, and their letters frae the post, and they persuaded me he was a kind o' serving body o' my ain; and traiking Tibbie had sell't my butter and eggs may-be thretty years and mair; so what could I do but let my house be made a public ae night in the thretty? and gentles to light on't, for a clean bed and hot supper! It's a judgment on me for being sae simple!"

"Keep yourself easy, Luckie!" answered G—, in her own style. "My friend here can get clean beds and hot suppers in England, but penny weddings are scarce enough, even in Scotland."

"The scarcer the better," said the hostess, drawing herself up with the demure look of one scandalised with unwonted revelry. "And now, sirs, what can I do for ye? There's no a bed in the house up but my ain; and though I wad gie ye't, I couldna promise ye peace to lie in't, for the fiddles'll be scraiching, and the folk skirling, and the reels daddin', till far i' the night; and the smell o' the punch'll be just poison to the gentleman frae England. Ye'll be that ill for supper, for I've a curm mutton pies by ordinar', that I seasoned mysel, and there's a creel fu' o' trout walloping down bye at the burn that wad pleasure a provost. Come slipping ben to my ain wee room, and ye's get a' the comfort I can gie ye, afore the folk's supper comes on—and for beds—I'll send the lass to the minister's, and get ye gude quarters for a word."

"I know the clergyman," said G—, seeing me hesitate. "His sons and I were at school together, and my first sunshiny holidays were spent among the hills we traversed to-day. I should like to see the manse once more, and a welcome will not be wanting, unless Mr Maxwell should be strangely altered."

"He is altered, honest man!" said the landlady, heeding only my comrade's last words—"grief's a great alterer! o' auld folk especially! and it's fifty year come Monday since the minister was placed in the parish, and thirty come the time since he married me and puir John Cairns doucely and Christian-like, in that very spence whar they daft devils are making a mock o' marriage atween twa auld randy ne'er-do-weels! But it's dune now, and what's the use o' reflections? Come your ways, gentlemen, to your supper."

It was with reluctance that I postponed, even to so important an affair—to a hungry prospect-hunter—the gratification of my curiosity. But reconciled to the landlady's fiat by the trout and mutton pies, and the comfort and cleanliness which reigned in her sanctum sanctorum, G— and I did ample justice to the savoury repast, and its crowning tumbler, whose whisky even I, a novice, could discern to be mountain-born, and guiltless of the Exchequer.

"I see ye're nae great hand at the whisky, sir," said the hostess, in answer to an equivocal shake of the head with which an Englishman generally salutes the indigenous flavour of genuine peat-reek; "but tak my word for't, as devil dings out anither, and if ye're to be dancin' and daffin' yonder, and the room reeking o' punch like a killogie, ye'll ken't a' the less for being a thought primed yourself; and ye'll dance a' the better for't, I've warrant,"—turning with a smile to G—; "a spur in the head's worth twa in the heel!"

So saying, the good lady, desirous to profit in her domestic affairs, by the intervals between the claims of her very opposite customers, snatched up the candle, and marshalled us to the scene of a festivity, to which, at the distance of a mile at least, our ears might have proved sufficient guides.

The hoarse squeak of the wary and muggy fiddlers was now well-nigh drowned by the far more efficient "lit" of some stentorian voices, on whose organs the "barley bree" had produced an exactly opposite effect; and the figure of one round rosy shepherd, who with bonnet "ajee" and picturesquely disposed plaid, sung, danced, and snapped his fingers, surrounded by a ring of admiring rivals, would have been worthy the pencil of a Teniers or a Wilkie.

His partner in the reel was no less a personage than the blushing bride—a weather-beaten crone of some sixty winters' bronzing; and as, exhilarated by the unwonted stimulant of applause, she strove to keep pace with the agile movements and giddy whirlings of her *vis a vis*, peals of unbridled laughter shook the quiet hostility to its very base.

The bridegroom again, an old Chelsea pensioner, whose once steady soldier-like frame retained some shadow of military bearing, spite of the joint inroads of palsy and potations, was doing his best to keep his equilibrium, as, like "Panting Time," he toiled after the winged heels of a mountain fairy of sixteen, whose shy but earnest gaze at the strangers, and bounding rapidity of motion, reminded me at once of the roe on her native hills.

Moved by compassion for this ill-matched couple, and well aware of the popular course on such occasions, G— dashed at once into the old man's place in the dance, and began threading its mazes with the blushing, but evidently flattered damsel, making me a sign to follow his example: a hint which neither my proficiency in the national dance, nor the charms of the bride, were sufficient to warrant my taking. I slid down unobserved beside some of the old elders present, whose shrewd remarks, and good-natured participations in the "daffin" of the youngsters, were not the least pleasing part of the motley scene.

The dance by this time—thanks to the punch, which had been freely circulating—was getting, as Burns says, "fast and furious." Gleams of broad national humour flashed through the habitual gravity of the demure blue-bonneted peasant of the group; and for a while there was abundance to excite both the Scottish feelings and constitutional gaiety of the young painter, and the natural curiosity of an English stranger. But giddy at length with the endless reels, deafened with the mirthful accompanying shrieks, half stifled with heat, and the fumes of the national beverage, we both felt it high time to breathe a purer air, and were in the act of quietly withdrawing (after laying on the pewter plate appropriated for the offering, our mite towards the hopeful couple), when we ran against our hostess, arriving for the special purpose—a very unwonted one in her vocation—of turning us out of doors.

"I was just coming, sirs, to gie ye a bit word o' counsel. I'm sure ye'll no take it ill at my hand; but it's time the like o' you were flitting, for the mair's getting abune the meal yonder, and they time respect whiles, and it's no wise-like to be in a minister's house, on Saturday night at e'en. Mr G—kens that!"

"No, indeed—you're quite right," answered the painter, "and, indeed, we were going away fully satisfied, when we met you." "Aweel, gang your ways like gude gentlemen, and I'll gie yon daft chieft their supper, and hae them a' out o' my house by the clap o' eleven. There sall naebody say they saw a Sabbath morning within't, tho' I wadna wonder if some o' the ill-doers were aff to the hill or some gait out o' hearing, to make a night o't. There's some folk canna hae their sairing either o' daffin' or drink, the mair's the pity!—Hech! but ye'll be weel aff that's quiet down by!"

"I'll call and settle the reckoning another time, Mrs Cairns," said my friend.

"Ay, ay," answered she, more chary of her time than her money, "one day when ye're dauning out among the hills. Ye're awin' me a day in hairst, ye ken, for this."

Never was the pure healthful mountain breeze more welcome than when it swept across our flushed and feverish brows on emerging from the steaming caldron within, or the silence of night more grateful than after the din of plebeian revelry in its most discordant form. But there reigned within the little parsonage an atmosphere holier and more healthful still! A more powerful contrast, a stranger juxtaposition of the lights and shadows of Scottish life, could scarcely be conceived, than presented itself between the orgies, and sounds and scents, and coarsely heaped banquet we had left behind, and the hallowed stillness, untainted air of the minister's modest apartment, and the inviting aspect of the little supper table, on whose snow-white linen yet reposed the Bibles and Psalters, recently used in the household's evening devotions. In these we had been too late to partake, but the spirit which had animated and hallowed them still lingered on the minister's brow, and the slender, retiring figure of the good pastor's blooming granddaughter seemed robed in almost angel purity.

There was that about our host which needed no such heightening. Even amid the sacred class of Scottish pastors, he rose pre-eminent—pre-eminent in trials, and in the submission which disarms them. Of a large and flourishing family, one daughter alone, the mother of the girl before us, survived; and she, separated from her grey-headed father, by the waters of the great Atlantic, could only cherish him by proxy, in the person of this interesting child.

It was not till after his hospitality had been requested for us that G— heard from the landlady the extent of the pastor's benevolences, and he would gladly have wished to spare the father's feelings by suppressing all acknowledgment of former acquaintance. But in a parent's memory the playmates of buried children have an almost filial hold, and the first words of Mr Maxwell on receiving us, were—"You are welcome once more to Bonell, Willie!—you've been twenty years a stranger."

"Not a willing one, sir, I am sure—but my studies in England and Italy, and professional duty, not only occupied me, but kept me ignorant, till now, of the sad blanks it has pleased Providence to make on your hospitable board. Had I been aware of them, I would not have intruded now to renew, by my presence, those griefs which I could not alleviate." "And wherefore no, Willie?" said the old man, in a tone that went at once even to a stranger's heart; "my brave boys are gone before me, it is true, leaving their old father to buffet a while with the billows. But praised be He who lent them!—they were such as a father can speak of with pride; and to do so with one who knew and loved them is a privilege rarely enjoyed. This gentleman, perhaps," turning courteously towards me, "will excuse the overflows of a parent's heart, at sight of one whose fair delicate brow he has often blessed, along with the dark curling heads he has lived to see laid in the dust. Tall and pale, and unlikely to live, ye were then, Willie; but ye have proved the reed that the tempest spares when oaks are rended!—But we'll talk of our Lilly now," said the old man cheerfully, shaking the fair hand of his grandchild as she stooped to collect the sacred volumes. "I think her mother must have been about her age when she knew the mause; saw ye ever two creatures liker?"

The entrance of a worthy old sister of our host's, who, on hospitable thoughts intent, had disappeared on our entrance, turned the conversation to more general topics—among others, to the penny wedding.

"I am glad," said Mr Maxwell, "I was spared the degradation of my office, by the residence of one at least of the hopeful pair in a neighbouring parish; and I wish the idle frolic which united them had been carried on farther from my door. I am no enemy to occasional rejoicings, and love to see innocent mirth; but the sport these poor wretches have been called to make, will end, I fear, like that of Samson, and bring an old house upon their heads."

"However, sir," turning to me, "that you may not suppose all our junketings are of so boisterous and equivocal a character, I hope you will stay over Monday, and help me to thank my kind people for assisting in keeping my fiftieth anniversary among them. I am sure, Willie, I may count upon you, for auld langsyne."

"Ay, that you may, sir, come what will of palette and pupils," exclaimed the young artist: and my acceptance, if less enthusiastic, was not the less cordial. To see in the midst of a grateful and affectionate flock, the faithful pastor of half a century, is a sight not often to be enjoyed, or lightly to be forfeited—and I too would have perilled fame or business, had they been mine, on the issue.

A Scottish Sabbath has been often described, but never, methinks, so as fully to convey to a stranger its exquisite stillness, and the palpable elevation of all in nature above the diurnal level of our "working-day world." It is not alone the absence of all sounds of labour or revelry, the softened tread of the rude hind, the subdued laughter of unconscious infancy; but the very whisper of the brooks and waving of the woods, seemed attuned to soberer and holier harmonies. The busy highway and toilsome furrow are alike deserted, while a thousand quiet hedgerow paths teem and glitter with long files of holiday-suited elders, and white-robed youth and childhood. If airs of Paradise do indeed ever penetrate our world's dense atmosphere, and breathe sweet influences from on high on privileged mortals, it is surely on a summer Sabbath, amid the green hills and pastoral vales of Scotland.

The little church of Bonell, primitive as though, instead of being near a metropolis, it had been perched on some lone isle of the Hebrides, was filled to excess on the present interesting occasion, with a congregation as perfectly in keeping with the scene and situation, as it was novel and striking to me.

There was not a face in the assembly—a sprinkling of rustic noblesse in the gallery hardly excepted—which could have been assigned by a physiognomist to any vocation save a rural one.

When the minister rose, breaths were held in, and the very dogs recalled their dreaming fancies from the dunghill side, lest a start or suppressed bark should disturb the solemn silence. The beautiful Twenty-third Psalm, always so great a favourite in a pastoral assembly, came more home to their feelings than ever, "when its green pastures and still waters" were applied, as they evidently were by the venerable reader, to his own tranquil sojourn of a lifetime in the glen of Bonell. The allusion to a darker valley, the inevitable and not very distant termination of a lengthened pilgrimage, woke a yet tenderer chord; and when these words were sung, as the psalmody of Scotland so impressively is by young and old, it was not the voice of the grey-haired contemporary parish clerk alone that betrayed signs of emotion!

The text was the simple words of the Psalmist—"I have been young, and now am old;" and when the

good man sketched with faltering voice an unpremeditated picture of that gradual pilgrimage from youth to age, every step of which many of his hearers had taken side by side with this tried veteran in the path of duty and affliction; when the young heard him allude with a parent's tenderness to follies they felt years could alone teach them entirely to abjure; and the old saw his venerable face lighted up with joys he had taught many, like himself, to draw from above—tears, fast and frequent as from dropping eaves, attested the sympathy that reigned between the good shepherd and his flock.

I awoke on the morrow, fancying all nature decked in tenfold beauty for the joyful anniversary; my own spirits elated with a healthful gladness which courtly fetes may take away, but could never yet bestow. The privileged guests for the day (G—and myself included) were the elders, most of whose fathers had presided at the minister's ordination—the school-master, who, in the absence of nearer and dearer, had long been to him as a son; and the doctor, who, under a dress and exterior rugged as those of his shepherd neighbours, veiled a skill beyond their simple wants, and few and rare ailments.

But a self-invited member was soon added to the group, in the person of a young neighbour laird, who made sport an excuse (with those who required any) for farming his own moderate patrimony, and enjoying, unfettered by the *etiquettes* of society—so called—the style of life most congenial to his age and disposition. At the breakfast-table, young Bonell, for so from his property he was styled, walked in, with his heartfelt congratulations, and a bag full of grouse, shot before town dandies had well composed themselves to their first sleep.

"Any other day of the year, Mr Maxwell," said the frank young sportsman, "I would have dropped in at dinner, and taken my chance of a welcome. But this is a sacred one, and I would like to have my intrusion sanctioned beforehand. If you think me worthy (and if you don't you'll say so, in spite of all your hospitality) to rejoice with you on your fifty years' retrospect of duties fulfilled and good deeds done—remember, you'll find it a hard matter ever to shut the door on me or my pretensions again."

"God forbid I should, Norman," said the old man, shaking his manly visitor by the hand; "a kind heart and a real one are aye welcome! Fifty years back, your father bore both, and his son is no changing! Stay with us now, or return, as it best suits you."

"Oh! I dare not stay," cried the young man, with a significant smile at Lilly and her aunt; "I should be sadly in the way. Besides, I spied a roe in the glen this morning, and must have another hit at the venison. What say you to a pasty, Miss Anne, between this and noon yet?"

"I'll say for her, Norman, that it will be like the savoury meat of Esau, that old Isaac valued for the hunter's sake, if ye get it; and if not, we've the will for the deed, and that's just the same. And now off with ye—else your pies in the bush will stand in the way of aunt Anne's puddings in hand."

"There goes as fine a lad as ever lived," said the pastor, as he went out. "If he were my own son, I could scarce love him better."

I looked up, and chanced to meet the delighted glance of the retreating Lilly; and it told me as plain as a thousand words, that the old man might, ere long, take to his heart a grandson!

The manse, meantime, teemed all the morning with unbidden yet privileged guests. Neighbouring pastors came to congratulate the willing fellow-labourer, under whose fatherly shadow themselves had grown insensibly grey—with whom they had "taken sweet counsel and walked in the house of God as friends"—and with whom they hoped, though in all humility, to stand side by side at the great account. Couples married by him in the earlier periods of his incumbency, still lived to thank him for half centuries of happiness; while children and grandchildren, christened by his hand, and made Christian by his precept and example, came with them to add their grateful acknowledgments.

Our party, swelled by a few guests of the better order, at length sat down to dinner; and never did feast (for a feast it was, fit for the court of aldermen) yield more unmingled satisfaction. The old man, exhilarated by the spontaneous burst of affection with which his anniversary had been hailed, felt a buoyancy of spirit to which he had for years been a stranger. G—and I were excited to the utmost by so unwonted a celebration. The dominie himself, through the week the "observed of all observers," looked up in delighted admiration to his own exemplary teacher; while the rough diamond of a doctor eyed him with the exact counterpart of the expression with which his dog, of the true shepherd breed, fixed his eyes in mute devotion on his master's well-known countenance. All felt, that, like the good Centurion in Scripture, he had but to say to any of them, "do this, and he doeth it; come, and he cometh." Their hearts, under Providence, were in his hand, and they felt it was well it should be so!

But there was in young Norman's reverential gaze something deeper and more filial than any, and strange to say! on this day alone, when all seemed elated and emboldened, it was tempered for the first time with fear. For Norman had a suit to prefer, before that evening should close, on which hung his own and another's happiness; and not all the softened feelings of

the day of jubilee would, he feared, reconcile the old pastor to the thought of parting with his Lilly! How this was to be brought about, or even hinted at, was more than even a lover could devise—so to Providence he left it, as he had been taught by his pastor to leave all besides.

And strangely was the knot cut, and the difficulty removed, ere the thought had well passed from the young man's troubled mind. Among the healths of that eventful evening, "absent friends," the one ever dearest to the hearts of Scotsmen, was not forgotten; and then, for the first time, did the pious father allow himself to whisper a regret that his daughter, the only stay of his old age, should dwell divided from him by duty, in the new world. True, she was solacing by her kindness, and cheering by her society, the labours in Christian usefulness of a worthy countryman whom the spiritual necessities of his exiled brethren had induced to forego home and kindred for their sakes. But they had been long, long absent on their labour of love, and a father's heart would yearn, on the proudest day of his life, for a glimpse of his long-banished only child!

The vain wish had crossed, like a passing cloud, the rarely dimmed serenity of his mind, and left but a halo behind, when, as Lilly and Norman were leaving the house to prepare for the juvenile fete, two plainly dressed, but respectable looking people, opened with something of strange familiarity the garden gate, and asked if Mr Maxwell was at home.

"He is," replied Norman, answering for the bashful and surprised girl; "but very particularly engaged with friends, who would be loath to part with him to-night, even on business."

"Lilly, my own Lilly!" sobbed out the female traveller, clasping her daughter to her heart—and then finding breath to say, "How is my dear father?" "Oh, well! well!" cried the delighted girl, hanging round her father's neck in frantic joy; "come and see him directly!"

"Not just directly, my own Lilly," said he, composedly;—"seventy-four is no age for surprises, even joyful ones. Sir," (turning to Norman, who stood studying, all lovers will guess how earnestly, the parents on whose fat hung his life), "my wife had set her heart on reaching home on her father's day of jubilee. We had a quick passage and a safe one, God be praised, to Liverpool, and, travelling day and night, were set down by coach this morning at B—. How to get on in time was the difficulty; but the backwoods have made us good walkers, and here we are, not too late for a grace-cup of thanksgiving to him who has brought us safe to our father's door, and to friends, who will make us welcome for his sake!—Please, sir, to pave the way for our meeting."

Norman hailed the omen, and came, as deliberately as joy would let him, into the room. "There are strangers without, sir, who wish to speak with you; and as they have tidings from New Brunswick, perhaps your friends will consent to spare you, though unwillingly."

"From New Brunswick!" exclaimed the old man, hastily rising, then sinking down again from the painful agitation; "you have seen and spoken to them—is all well? Norman, my son, tell me truly." "All well, even as your heart could wish; but there are those without who could tell you better, far better than any words, about those you love!" "Are they still without?—oh, bring them in, pray—our friends will excuse." "But will you promise?" The old man cast a bewildered gaze around—caught a glimpse of Lilly's beaming face as it peeped eagerly in at the half-open door, and exclaiming, "My bairn! my bairn!" sank back insensible on his chair!

We bore him gently out to the open air, whose reviving freshness, and, still more, the voice and aspect of his darling daughter, soon restored him to himself. Who could describe their meeting, half as well as one throb of long-severed hearts will bring it home to every bosom? Suffice it to say, it was a meet commemoration for such an anniversary!—*Literary Souvenir*, 1832.

NOLLEKENS.—Nollekens, the celebrated sculptor, died immensely rich. "His singular and parsimonious habits," says his biographer, "were most observable in his domestic life. Coals were articles of great consideration with Mr Nollekens; and these he so rigidly economised, that they were always sent early, before his men came to work, in order that he might have leisure time for counting the sacks, and disposing of the large coals in what was originally designed by the builder of his house for a wine-cellar, so that he might lock them up for parlour use. Candles were never lighted at the commencement of the evening; and whenever they heard a knock at the door, they would wait until they heard a second rap, lest the first should have been a runaway, and their candle wasted. Mr and Mrs Nollekens used a flat candlestick when there was anything to be done; and I have been assured, that a pair of moulds, by being well nursed, and put out when company went away, once lasted them a whole year!" Insensible as Nollekens generally was when looking at works of ancient art, in no instance, except when speaking of Flaxman, did he depreciate the productions of modern artists; on the contrary, he has frequently said, when he has been solicited to model a bust, "Go to Chantrey—he's the man for a bust; he'll make a good bust for you; I always recommend him." He has been known to

give an artist, who could not afford to purchase it, a lump of stone, to enable him to execute an order, though at the same time he has thrown himself into a violent passion with the cat, for biting the feather off an old pen with which he had for many years oiled the hinges of his gates when they creaked.—*Nollekens and his Times*.

SPANISH BULL-FIGHTS.

THE celebrated bull-fights of Spain have been frequently described by travellers, as they form a strong and remarkable characteristic in the manners of the people, and have luckily no parallel in other parts of Europe. When Sir Arthur de Capell Brooke was at the town of St Mary's, in Spain, he witnessed these extravagant amusements, of which he presents the following interesting account in the work he has recently published:—

"At an early hour of the morning the bulls were brought in from the country, where, in the extensive plains and forests, they roam at large. The lower orders are highly delighted by the arrival of the animals, and hundreds generally sit up the preceding night amusing themselves with their cigars, singing, and dancing, until the hour when the beasts, having been previously collected, are driven, not without considerable risk, into an enclosure adjoining the theatre. The spectacle commenced in the afternoon; and on entering the box of the French general, the Count de Castellane, where I had been politely offered a seat, I found myself surrounded by the beauty and fashion of the place. The theatre, which was circular in form, and open at top, was so spacious as to be capable of accommodating 12,000 persons; the effect, filled as the house was with gaily attired groups, was singularly imposing. In former days it was the fashion of young men of family to enter the ring splendidly dressed as picadores, to attack the bull in honour of their mistresses, who were present to applaud their courage, and reward them by throwing down wreaths to them. The young men in those days rode fine spirited animals, instead of the poor wretched dog-horses now used, which are too weak to resist the attack of the bull, or even to get out of its way.

The theatre being filled, and every countenance displaying the most intense anxiety, a flourish of trumpets announced the approach of the governor, who entered his box. This was the signal for the commencement of the pageant. A detachment of soldiers paraded the arena in different directions, in order to clear it of the numerous stragglers who had leaped down from the adjoining seats.

The picadores, on horseback, half a dozen in number, now entered the ring, and, advancing to the governor's box, made an obeisance, and having received their lances, wheeled round, and made their exit on the opposite side. They were mounted on sorry miserable steeds, and were themselves armed with a lance, the end of which was provided with a short angular iron point about an inch in length, and wrapped partly round with string to prevent it penetrating too deep; its purpose being to goad the animal, and turn it off from the horseman when an attack is made upon him. Sometimes, however, as I have seen on more than one occasion, the bull makes so furious a rush upon the picador, that the lance is accidentally driven some way into the body of the animal, who, after some time, works the instrument out in its galloping.

A flourish of trumpets now made the whole theatre resound; and the doors being thrown open, a procession entered, formed of those about to take part in the proceedings of the day, and consisting first of four picadores mounted: these were followed by the matadores and footmen, the rear being brought up by three horses abreast, gaily caparisoned with bells and coloured flags. Both horsemen and footmen, as they entered, advanced in front of the governor's box, and, respectfully saluting him, wheeled round and took their respective stations. The object of the footmen, or banderilleros, who are provided with small flags, is to divert the attention of the bull after he has made an attack on the picador, and to prevent the animal from immediately repeating it, which would be attended with great hazard both to the horse and the rider. As soon, therefore, as the bull has made a charge upon the picador, the footman runs up, and by means of the banderilla or flag, which he flourishes towards the bull, shouting at the same time, the animal is induced to leave the picador, and makes at his new opponent, who, having now succeeded in drawing off the animal, effects his escape with great agility, by slipping behind the partitions which are erected in different parts of the arena as places of refuge. It sometimes happens, however, that the footmen are so closely pursued by the bull that they have not time to make good their retreat, and are obliged to save themselves by vaulting nimbly into the front row of seats, where the spectators are stationed, a few feet above the arena; and instances have happened where the animal has pursued the man so fiercely as even to spring over the enclosure after him, to the great danger and confusion of those in the neighbourhood.

The strength of the bulls is purposely weakened by a cruel expedient, which consists in pressing the back of the animal, as it rushes out, with a very heavy door, which shuts the stall, and is made to lift up, though of such weight as to require several men to raise it;

this naturally strains the animal's back, and diminishes its power.

A tame bull, with a bell round its neck, was now led across the arena towards the folding doors through which the wild bulls were to make their entrée. Stationed close upon each side of these doors were the picadores, with their lances ready couched; and the bolts being withdrawn, the whole of the animals rushed into the theatre, and followed the tame one, which was led quickly back through the opposite door into a stable, from which they were to be let out singly for the combat. On sight of the animals, which rushed through in fine style, the whole theatre rung with the shouts of the multitudes, which added to the fury and amazement of the bulls at the scene so suddenly presented to their eyes.

Every thing was now ready. At the flourish of the trumpets, the doors were thrown wide open; and while breathless expectation kept the whole theatre in a state of profound silence, a fine black Andalusian bull came tearing at full speed into the arena, and was greeted by the loud acclamations of the spectators, and the waving of innumerable handkerchiefs of the fair sex. For a few seconds the animal appeared lost and stupefied at a spectacle so novel to it, when, its rage returning, it wheeled round, and, perceiving the first picador, made a furious charge on man and horse, and was dexterously received on the point of the lance, the sudden prick of which caused the creature to turn aside and bound into the middle, bellowing with pain and fury. The second picador now advanced for the purpose of attracting the notice of the animal, but, being in an awkward position for resisting it, received so severe an attack, that both man and horse were overthrown, and exposed to the rage of the beast. The violence of the shock threw the rider off, but he contrived to roll himself beyond the reach of the animal while it was venting its rage upon the unfortunate horse, which received so severe a wound as to survive but a few minutes. In the meantime, the banderilleros darted forward like lightning to the assistance of the picador; and drawing off the bull to the opposite side by waving their flags at the animal, he was enabled to effect his escape without having received any particular injury.

The animal now galloped wildly round the arena, and was not long in making his attack upon the third picador with such strength and fury, that both man and horse were actually lifted from the ground, loud shrieks proceeding at the same time from the female part of the audience. As soon, however, as it was found that the rider had sustained no injury, shouts of laughter and exultation resounded from all parts of the building, which, at least as respected the poor horse, were little called for; as the unfortunate animal, after staggering for some distance with his bowels protruding, fell dead, and was dragged out. The bull proved to be an excellent one, and received, in consequence, the noise and repeated plaudits of the assembled spectators. Every horse, indeed, had suffered from the attack of the infuriated animal; and it would be too shocking to describe minutely the various tortures these poor creatures had to undergo. It was not sufficient for their bodies to be ripped up and their insides exposed. As long as they could be kept on their legs, the merciless fiends on their backs kept urging them bleeding and exhausted round the arena to make a fresh attack, until, in some instances, the bowels, hanging down and dragging upon the ground, were actually trampled upon and torn out by the tortured animal itself, when it fell down and expired.

The first act of this bloody tragedy was now at an end; and the dead and wounded horses being dragged out, the trumpet sounded, and six footmen approached, each provided with a couple of darts about two feet in length, having a sharp single barbed point of iron, and the handle, which was of wood, being ornamented with white, or other coloured cut paper, which covered it like network.

Holding a dart in each hand, one of them advanced lightly and boldly towards the animal, provoking it at the same time by his gestures; and at the moment that the bull rushed upon him, and was in the act of lowering his head to toss his antagonist, the latter nimbly stepped aside, planting, at the same time, both darts behind the neck and on the top of each shoulder of the animal, which galloped wildly round the theatre from this additional pain, and tried to shake out the barbed points. A second then approaching, fixed two more with equal skill; and then a third, until the back of the creature was fantastically stuck over in this manner with these cruel weapons; while, mad with torture and rage, it galloped bellowing after its persecutors, who sheltered themselves behind the side slips, or, vaulting up into the front seats, escaped, by these means, the fury of their pursuer.

By this time the animal was nearly mad; and in order to render it completely so, and to exhibit at the same time a diabolical variety in the tortures of this poor creature, these demons now introduced short rockets barbed like the darts, and which, being stuck dexterously into the body, burnt fiercely, ending with a loud explosion, while the wretched creature, bewildered with the fire, the smoke, and the report, stood quite stupefied, and paralysed with fear and agony.

The third and final scene was now about to commence, concluding with the death of the bull.

All eyes were directed towards the matador, whose name was Leon: he had attained great celebrity in this his dangerous profession, and had come purposely

from Seville to be present. On his head he wore a kind of flat black silk cap, similar to the montera cap worn by the mountaineers in some parts of Spain, his hair being fastened behind with a large court bag; his jacket, which was open, was of light blue silk, richly embroidered with silver, with a puce-coloured worked satin waistcoat: his small clothes were also of light blue silk, richly worked in silver, at the knees, with white silk stockings and straw-coloured shoes. In his left hand he carried a small crimson flag, and in the other a straight sword about four feet in length.

Advancing in front of the governor's box with easy and polished demeanour, he exclaimed, in a loud voice, that, with his permission, he would, for the honour of his lady, himself, and that of the whole company present, now kill the bull. Leave having been accordingly granted by the governor, he bowed to all around, and advanced fearlessly towards the animal, whom the footmen were now drawing towards him with their flags, with a light and graceful step. Having approached within six feet of the bull, he held out his flag, concealing under it his sword: and the animal rushing immediately upon him, and while in the act of lowering his head to toss the matador, received the weapon on the point of the shoulder nearly up to the hilt.

The poor creature staggered, and in a minute or two lay down, and a person coming behind, despatched him by driving a sharp-pointed instrument into the vertebra at the back of his head. The matador, now drawing out his sword, wiped it with his flag, and advancing amid the loud plaudits of the whole theatre, made his obeisance to the governor, and retired. The trumpets upon this sounded, and three horses abreast, gaily adorned, and attached to a yoke, made their entrée; and the dead animal being fastened to it, was dragged across the theatre at full speed through the entrance doors.

Eight bulls in succession were thus brought in, and tortured in the manner above described, and at least thirty horses were mangled and destroyed from being exposed to their attacks. As the whole of the bulls are not usually slaughtered, it is a privilege accorded to the people by the governor to select those they please for the matador to despatch. Accordingly, when a bull has established its reputation for courage and vigour during the encounter, by having ripped up seven or eight horses, tossed their riders, and perhaps nearly killed two or three of the footmen, the audience are quite enchanted with the animal, and as a compliment to its prowess, they beg, with loud cries of '*A la muerte*,' addressed to the governor, that it may be killed: on the contrary, if a bull has shown itself docile and spiritless, they are silent, and the animal escapes death to endure the *disgrace* of existence!

Without entering into any inquiry how far the national character is affected by the bull-fights in Spain, I shall only observe, that it cannot but be lowered in the estimation of the feeling and benevolent, from the excessive barbarity of the amusement."

THE IONIAN ISLANDS.

THE islands in the Mediterranean now constituting the Ionian republic, form one of the most interesting foreign possessions of Great Britain, and are the object of curious inquiry to the classic scholar. According to the authentic account of Kendrick, in his entertaining work on the subject, "these islands lie scattered along the west coast of Turkey and Greece, with whose ancient history they are intimately associated, and are the last remains of the Venetian conquests in the east. While the banner of the sultans of Constantinople waved over the rest of the fallen empire of Greece, Venice, the powerful queen of the Adriatic, held possession of the Morea, Crete, Cyprus, the islands which skirt the western coast, or the eastern side of the gulf, with a narrow strip of land on the adjacent mainland. The arms of the republic, however, gradually declined; and after many a gallant achievement, all her splendid acquisitions were reduced to Dalmatia, the Ionian Islands, and the adjoining parts of Parga, Prevesa, Vionizza, and Butrinto, in Albania, which remained in faithful obedience till the extinction of her independence in 1787. The despotic Venetian aristocracy left, even to its Italian subjects, little to boast of but the shadow of liberty; and their possessions in Greece, now under notice, were still farther from the enjoyment of freedom. Unwise restrictions on the cultivation of their soil, dictated, as it was thought, for the benefit of the mother country, with the usual arbitrary exactions of arbitrary governors, were the principal proofs of the maternal protection of Venice. But, with all these drawbacks, the islanders enjoyed advantages inestimably greater than those of their countrymen under the Turkish yoke.

This state of things continued till 1797, when Venice ceased to exist as a republic, and this part of her territory became subject to France. After a short occupation, the islands were evacuated by the French troops, and recognised at the peace of Amiens, as an independent state, under the protection of Russia. A secret agreement with the Russian emperor again consigned them to the power of Napoleon; and a large military force, which landed in 1807, kept possession of Corfu till the termination of hostilities in 1814. At the very time that the English, who had occupied Zante, Cephalonia, Ithaca, and Cerigo, since 1809, and captured Santa Maura in 1810, had seized Paxa, for

the purpose of preparing an expedition against Corfu, a convention placed the whole of the seven islands in the hands of Great Britain. The treaty of Vienna continued them under the protection of this country; a national flag was allowed them; and a constitution, under which they were denominated the "United States of the Ionian Islands," was ceded to them. The government at present consists of a senate of ten members, with a prince, president, and legislative assembly of forty deputies, who meet regularly at Corfu, and enact laws subject to the revision and control of a lord high commissioner, appointed by the British crown. The aggregate extent of the Ionian republic is about equal to that of Somersetshire, and the amount of its population upwards of 200,000. Scattered along a line of coast, which stretches from latitude 36° to 40°, they are subject to great vicissitudes of heat and cold, though in some of the islands, particularly Zante, the air is pure and salubrious. The established religion is that of the Greek church, which, under British protection, has acquired a considerable accession of dignity. An archbishop presides over the whole.

The inhabitants of the Ionian Islands are a mixture of the Greek and the Italian—two of the most debased nations on the face of the earth. They are, in general, timid, revengeful, and implacable; litigious to an extraordinary degree; ignorant and superstitiously devout; full of professions which they have no intention of fulfilling; and utterly unworthy of confidence in commercial dealings. Oriental jealousy of females predominates. The women are treated as beings of an inferior nature, and their minds are consequently without cultivation or refined virtuous sentiment. This low state of morals is, however, said to be improving. Already do the islanders wonder at the inflexible impartiality with which public justice is executed on criminals; already has the uncompromising character of the English, and their uprightness in commercial transactions, excited admiration, and to admire and to imitate are not often disjoined. These islands could not indeed be placed in a situation more favourable for moral improvement, or political importance, than that which they now occupy under the protection of Great Britain. Freed from all apprehension of external foes, the citizens enjoy all the advantages of internal freedom; and it may be, indeed, with truth asserted, that since the ancient heroic ages, these isles have not held a rank so dignified among the nations of the world. Besides the English troops sent for the protection of the country, there is a native militia, both subsisted by the Ionians.

Corfu, or Corcyra, the most northerly of the group, though only second in size, is the first in importance. Under the 39th parallel of latitude, it stretches from north to south in a semicircular shape, and is separated from the mainland by a channel, which, at the narrowest point, is not more than two miles in breadth—has some high ridgy land, but the general appearance of the country is indicative of great fertility; its principal productions are wine and oil; and the climate, with a colder winter, differs little from the softness of Zante. In the midst of a bay, shut in by mountains, stands the capital, Corfu, pre-eminent in filth and deformity above the generality of the Mediterranean towns. It is surrounded by walls, and strongly fortified with outworks. The narrowness of the streets has been improved by the English, and shrubberies and plantations formed on the esplanade, the only beautiful or inhabitable part of the city. Here, and in the adjoining streets, the principal part of the public buildings are situated; and the palace of the high commissioner forms one of its prominent ornaments. In front of the harbour, about a mile from the shore, lies the battlemented rock of Vido, the batteries of which are bristled with heavy ordnance, and command both the town and the shipping. The island is divided into four districts; and of its population of 62,000, nearly one-fourth inhabits the capital, and the remainder is distributed in about eighty villages.

It is asserted by Strabo, that Corcyra was colonised by the Corinthians, six centuries anterior to the Trojan war; and if we give credit to the opinion which identifies this island with Phœacia of Homer, the poet's description of the gardens of Alcinoüs expresses, in glowing terms, its riches and refinement during those ages of fable. When we descend, however, into the regions of historical truth, we find the Corcyraans, after having abolished monarchical government, essaying the newborn strength of their republic in a successful contest with the mother-country, then governed by the famous Periander. They afterwards contributed their quota to repel the invasion of the Persian king; and gave protection to Themistocles, when the illustrious fugitive sought refuge from the violence of the Athenian mob. But the most glorious page in their history is the second struggle which they maintained against Corinth, and which, in its results, was one of the proximate causes of the Peloponnesian war. As to the antiquities of the island, not a vestige remains to indicate the ancient city of the Phœacians; but in the neighbourhood of the modern town are numerous ruins, among which scattered fragments of Doric and Ionic columns, large masses of square stone, and broken pieces of Mosaic, attest the wealth and magnificence of the capital of the Corcyraean commonwealth.

Cephalonia, the largest of the Ionian Islands, still retains its ancient name. It is situated midway between Santa Maura and Zante, at the distance of about twenty-four miles from the western shore of the Pe-

loponnésus, and is about 150 miles in circumference. The whole island consists of one irregular mountain mass, which traverses its greatest length from north-west to south-east; at the distance of fifteen miles from this latter extremity, rises abruptly into a lofty ridge the celebrated Mount Evos, of antiquity. The ancient greatness of Cephalonia is evident from the stupendous ruins of Samos, Cranii, Pala, and Pronos, the capitals of the four states into which it is divided.

Next in size is Zante, the ancient Zacynthus, being nearly 60 miles in circumference. Ramparted on its western coast by a steep range of limestone hills, upwards of 1000 feet in elevation, and on its eastern by Monte Skapo and other eminences, the intermediate space is occupied by a valley, on which nature has lavished all her charms; its surface is thickly strewn with groves of orange, and citron, and olive. On the mountain sides are scattered numerous flourishing villages, whose inhabitants derive their subsistence from the product of the pleasing landscape beneath them. The staple productions of Zante are currants and oil, though the soil also yields corn, cotton, and flax.

About six miles distant from the northernmost point of Cephalonia, and separated from the coast of Acarnania by a channel not more than fifteen miles in breadth, lies the once far-famed Ithaca. Little else at its first appearance than a rugged line of lofty rocks, it presents, on more close inspection, numerous features which characterise it as the seat of the empire of Ulysses. The island is about seventeen miles in length, and of a very irregular breadth, though in no part exceeding five miles.

To the north of Ithaca lies Santa Maura, the Leucodia of antiquity, of a figure somewhat triangular, measuring thirty miles from north to south, and of a rugged mountainous character. United originally to the continent, according to Strabo, it was divided from it by an artificial channel, cut by the commercial and enterprising Corinthians. This channel is now useless for maritime purposes, and in many places is not more than a hundred yards across. The sites of the two ancient cities Leucate and Ellomenas have been discovered, though much of the ground which they occupied has become the territory of the olive. A part of the island, and that not the least interesting, remains unaltered by the hand of time. We allude to the ancient Leucas, from which, as the poets tell, the unhappy and devoted Sappho cast herself into the ocean which rolls below it, and extinguished at once her passion and her life. The promontory of Leucas, or, as it is now called, Cape Decato, is situated at the most southern point of the island. It is a rugged cliff, rising to the height of 115 feet above the sea. A few paces nearer its extreme point than the spot supposed to have been the scene of Sappho's leap, are to be seen some ruins, which are conjectured to be Apollo's Temple. The scenery of Santa Maura is often highly striking and picturesque, while, from some of its more elevated points, the spectator is presented with views as magnificent as any on which the eye can rest. To the northward may be seen the whole land of Cephalonia; part of the rugged Ithaca; the romantic scenery of the Bay of Arta, and the 'beaked' promontory of Actium; whilst, to the eastward, rise the snow-topped mountains of the ancient mainland of Greece.*

THE IRISH MAGISTRATE.

A FEW years before the battle of Knocknadh, an extraordinary instance of civic justice occurred in this town, which in the eyes of its citizens elevated their chief magistrate to a rank with the inflexible Roman. James Lynch Fitz-Stephen, an opulent merchant, was mayor of Galway in 1493. He had made several voyages to Spain, as a considerable intercourse was then kept up between that country and the western coast of Ireland. When returning from his last visit, he brought with him the son of a respectable merchant named Gomez, whose hospitality he had largely experienced, and who was now received by his family with all that warmth of affection which from the earliest period has characterised the natives of Ireland. Young Gomez soon became the intimate associate of Walter Lynch, the only son of the mayor, a youth in his twenty-first year, and who possessed qualities of mind and body which rendered him an object of general admiration; but to these was unhappily united a disposition to libertinism, which was a source of the greatest affliction to his father. The worthy magistrate, however, was now led to entertain hopes of a favourable change in his son's character, as he was engaged in paying honourable addresses to a beautiful young lady of good family and fortune. Preparatory to the nuptials, the mayor gave a splendid entertainment, at which young Lynch fancied his intended bride viewed his Spanish friend with too much regard. The fire of jealousy was instantly lighted up in his distempered brain, and at their next interview he accused his beloved Agnes of unfaithfulness to him. Irritated at its injustice, the offended fair one disinclined to deny the charge, and the lovers parted in anger.

On the following night, while Walter Lynch slowly passed the residence of his Agnes, he observed young Gomez to leave the house, as he had been invited by her father to spend that evening with him. All his suspicions now received the most dreadful confirma-

tion, and in maddened fury he rushed on his unsuspecting friend, who, alarmed by a voice which the frantic rage of his pursuer prevented him from recognising, fled towards a solitary quarter of the town near the shore. Lynch maintained the fell pursuit till his victim had nearly reached the water's edge, when he overtook him, darted a poniard into his heart, and plunged his body, bleeding, into the sea, which, during the night, threw it back again upon the shore, where it was found and recognised on the following morning.

The wretched murderer, after contemplating for a moment the deed of horror which he had perpetrated, sought to hide himself in the recesses of an adjoining wood, where he passed the night a prey to all those conflicting feelings which the loss of that happiness he had so ardently expected, and a sense of guilt of the deepest dye, could inflict. He at length found some degree of consolation in the firm resolution of surrendering himself to the law, as the only means now left to him of expiating the dreadful crime which he had committed against society. With this determination he bent his steps towards the town at the earliest dawn of the following morning; but he had scarcely reached its precincts, when he met a crowd approaching, amongst whom, with shame and terror, he observed his father on horseback, attended by several officers of justice. At present, the venerable magistrate had no suspicion that his only son was the assassin of his friend and guest; but when young Lynch proclaimed himself the murderer, a conflict of feeling seized the wretched father beyond the power of language to describe. To him, as chief magistrate of the town, was entrusted the power of life and death. For a moment the strong affection of a parent pleaded in his breast in behalf of his wretched son; but this quickly gave place to a sense of duty in his magisterial capacity as an impartial dispenser of the laws. The latter feeling at length predominated; and although he now perceived that the cup of earthly bliss was about to be for ever dashed from his lips, he resolved to sacrifice all personal considerations to his love of justice, and ordered the guard to secure their prisoner.

The sad procession moved slowly towards the prison amidst a concourse of spectators, some of whom expressed the strongest admiration at the upright conduct of the magistrate, while others were equally loud in their lamentations for the unhappy fate of a highly accomplished youth who had long been a universal favourite. But the firmness of the mayor had to withstand a still greater shock, when the mother, sisters, and intended bride of the wretched Walter, beheld him who had been their hope and pride, approach pale, bound, and surrounded with spears. Their frantic outcries affected every heart, except that of the inflexible magistrate, who had now resolved to sacrifice life, with all that makes life valuable, rather than swerve from the path of duty.

In a few days the trial of Walter Lynch took place, and in a provincial town of Ireland, containing at that period not more than three thousand inhabitants, a father was beheld sitting in judgment, like another Brutus, on his only son; and, like him, too, condemning that son to die, as a sacrifice to public justice. Yet the trial of the firmness of the upright and inflexible magistrate did not end here. His was a virtue too refined for vulgar minds; the populace loudly demanded the prisoner's release, and were only prevented by the guards from demolishing the prison, and the mayor's house, which adjoined it; and their fury was increased on learning that the unhappy prisoner had now become anxious for life. To these ebullitions of popular rage were added the intercessions of persons of the first rank and influence in Galway, and the entreaties of his dearest relatives and friends; but while Lynch evinced all the feeling of a father and a man placed in his singularly distressing circumstances, he undauntedly declared that the law should take its course.

On the night preceding the fatal day appointed for the execution of Walter Lynch, this extraordinary man entered the dungeon of his son, holding in his hand a lamp, and accompanied by a priest. He locked the grate after him, kept the keys fast in his hand, and then seated himself in a recess of the wall. The wretched culprit drew near, and, with a faltering tongue, asked if he had any thing to hope. The mayor answered, "No, my son—your life is forfeited to the laws, and at sunrise you must die! I have prayed for your prosperity; but that is at an end— with this world you have done for ever—were any other but your wretched father your judge, I might have dropped a tear over my child's misfortune, and solicited for his life, even though stained with murder; but you must die; these are the last drops which shall quench the sparks of nature; and if you dare hope, implore that heaven may not shut the gates of mercy on the destroyer of his fellow-creature. I am now come to join with this good man in petitioning God to give you such composure as will enable you to meet your punishment with becoming resignation." After this affecting address, he called on the clergyman to offer up their united prayers for God's forgiveness to his unhappy son, and that he might be fully fortified to meet the approaching catastrophe. In the ensuing supplications at a throne of mercy, the youthful culprit joined with fervour, and spoke of life and its concerns no more.

Day had scarcely broken when the signal of prepa-

ration was heard among the guards without. The father rose, and assisted the executioner to remove the fetters which bound his unfortunate son. Then unlocking the door, he placed him between the priest and himself, leaning upon an arm of each. In this manner they ascended a flight of steps lined with soldiers, and were passing on to gain the street, when a new trial assailed the magistrate, for which he appears not to have been unprepared. His wretched wife, whose name was Blake, falling in her personal exertions to save the life of her son, had gone in distraction to the heads of her own family, and prevailed on them, for the honour of their house, to rescue him from ignominy. They flew to arms, and a prodigious concourse soon assembled to support them, whose outcries for mercy to the culprit must have shaken any nerves less firm than those of the mayor of Galway. He exhorted them to yield submission to the laws of their country; but finding all his efforts fruitless to accomplish the ends of justice at the accustomed place and by the usual hands, he, by a desperate victory over parental feeling, resolved himself to perform the sacrifice which he had vowed to pay on its altar. Still retaining a hold of his unfortunate son, he mounted with him by a winding stair within the building, that led to an arched window overlooking the street, which he saw filled by the populace. Here he secured the end of the rope which had been previously fixed round the neck of his son, to an iron staple which projected from the wall, and, after taking from him a last embrace, he launched him into eternity.

The intrepid magistrate expected instant death from the fury of the populace; but the people seemed so much overawed or confounded by the magnanimous act, that they retired slowly and peaceably to their several dwellings. The innocent cause of this sad tragedy is said to have died soon after of grief, and the unhappy father of Walter Lynch to have secluded himself during the remainder of his life from all society, except that of his mourning family. His house still exists in Lombard Street, Galway, which is yet known by the name of "Dead Man's Lane," and under the front window are to be seen a skull and cross bones executed in black marble.—*Edinburgh Literary Gazette.*

ADVANTAGE OF SHORT STATURE.

Lord Chesterfield being given to understand that he would die by inches, very philosophically replied, "If that be the case, I am happy that I am not so tall as Sir Thomas Robinson."

SLAVERY IN NORTH AMERICA.

It appears from the works of various writers on the North American republic, that in thirteen out of the twenty-four states slavery has been abolished by law; in nine eleven others, exists in full vigour, though variously modified, according to the genius and character of the several governments. It is mentioned that much more inquietude is felt with respect to the free blacks than the slaves; for there, as every where else, the whites have an unconquerable aversion from any connexion or intercourse with persons of colour: and this puts a complete check to an amalgamation of the two races. When we reflect on the character of the social compact in the North American states, and the genius of the people, this objection on the part of the white population to mingle or associate with the blacks, certainly does appear an inconsistency: yet it can be reconciled with our own feelings; for it is a question which has never yet been answered satisfactorily, whether the British public, generally speaking, would enter into all the familiarities of ordinary life with free blacks, of the same rank and appearance in a large body in this country, as the gentler, for instance, an emancipationist would willingly allow his white daughter to marry a black person just released from slavery, or at best the son of a slave. Now, until this be settled in favour of the negro, we have no right to sneer at the natural antipathies of the American. Unfortunately, there exist in some of the states laws relative to persons of colour very much at variance with the principles of the general constitution, which tend to keep up the feelings of interests, as well as a deeply rooted hatred, among the two classes. In most of the states, the negroes may be sold to pay the debts of their masters, contracted before their emancipation. In thirteen of the states, the constitution expressly forbids them to vote, and, in all the others, except Pennsylvania and New York, they are deprived the right of suffrage by special laws. Some of the southern states have forbidden free negroes to enter their domain under severe penalties; and, in some states, slaves are only allowed to be emancipated on the understanding that they shall quit the state immediately on obtaining their freedom. Something has been done to relieve certain parts in the Union of the black population, by means of deportation to the coast of Africa, where a tract of country, called Liberia, has been purchased for a settlement. But the great and regular increase of slaves and free blacks renders this mode of disposal hopeless. How, then, the American states are to be relieved of this exceedingly large portion of their citizens, it is absolutely impossible to decide. In writing on this topic, Jefferson shuddered to contemplate the collision which must, sooner or later, take place between the two races; for, says he, "nothing is more certainly written in the book of fate than that these people are to be free; nor is it less certain that the two races, equally free, cannot live in the same government." Already, questions touching the delicate and dangerous subject of permitting the continuance of slavery have embittered the peace of the Union, and it is more than probable, that at no distant day, the southern, or slave-holding states, will separate themselves from those in the north, who discountenance such practices, and are more tolerant in their conduct.

PHYSICIANS.

In England it was not customary for physicians to make their visits in carriages until about the year 1670, when they began to expect a double fee—namely, two angels, or twenty shillings, an angel of gold being an ancient coin of the value of ten shillings. "For," says the author of *Lex Talionis*, "there must now be a little coach and two horses; and, being thus attended, half a piece, their usual fee, is but ill taken, and popped into their left pocket, and possibly may cause the patient to send for his worship twice before he will come again to the hazard of another angel." Before this, physicians of much practice used to visit patients on horseback, riding, however, sideways, on footcloths, like females. Doctor Simeon Fox, and Doctor Argent, are said to have been the last Presidents of the College who visited their patients in this manner.

PRAYERS AT SEA.

We were now sixteen days from Callao (says Stewart in his visit to the South Seas), without any incident worthy of notice. Having run the whole distance in the full strength of the south-east trade-winds, and directly in their course, we have had a breeze unceasingly fresh and fair, with all the inconvenience of rolling so heavily before it, as to have been denied, to a great degree, every profitable occupation of time, even that of reading with comfort. Yesterday was our Sabbath. The only difference in the mode of performing religious service here, and on board the *Guerriero*, is in the signal used in assembling the crew. Instead of the boat-swain's pipe, followed by the hoarse call around the decks, "All

* The above statements have been drawn from a work entitled "The Ionian Islands, by T. Kendrick, Esq.," and from an able article in *Knights' Quarterly Magazine*, an ingenious periodical, abandoned some years ago.

the curs proceeded at such a rate that we merely noticed this, and put spurs to our horses, which galloped on towards the centre of the swamp. One bayou was crossed, then another still larger and more muddy; but the dogs were brushing forward, and as the horses began to pant at a furious rate, we judged it expedient to leave them, and advance on foot. These determined hunters knew that the Cougar being wounded, would shortly ascend another tree, where in all probability he would remain for a considerable time, and that it would be easy to follow the track of the dogs. We dismounted, took off the saddles and bridles, set the bells attached to the horses' necks at liberty to jingle, hopped the animals, and left them to shift for themselves.

Now, kind reader, follow the group marching through the swamp, crossing muddy pools, and making the best of their way over fallen trees and amongst the tangled rushes that now and then covered acres of ground. If you are a hunter yourself, all this will appear nothing to you; but if crowded assemblies of "beauty and fashion," or the quiet enjoyment of your "pleasure grounds," alone delight you, I must mend my pen before I attempt to give you an idea of the pleasure felt on such an expedition.

After marching for a couple of hours, we again heard the dogs. Each of us pressed forward, elated at the thought of terminating the career of the Cougar. Some of the dogs were heard whining, although the greater number barked vehemently. We felt assured that the Cougar was treed, and that he would rest for some time to recover from his fatigue. As we came up to the dogs, we discovered the ferocious animal lying across a large branch, close to the trunk of a cotton-wood tree. His broad breast lay towards us; his eyes were at one time bent on us and again on the dogs beneath and around him; one of his fore-legs hung loosely by his side, and he lay crouched, with his ears lowered close to his head, as if he thought he might remain undiscovered. Three balls were fired at him, at a given signal, on which he sprang a few feet from the branch, and tumbled headlong to the ground. Attacked on all sides by the enraged curs, the infuriated Cougar fought with desperate valour; but the squatter advancing in front of the party, and almost in the midst of the dogs, shot him immediately behind and beneath the left shoulder. The Cougar writhed for a moment in agony, and in another lay dead.

The sun was now sinking in the west. Two of the hunters separated from the rest, to procure venison, whilst the squatter's sons were ordered to make the best of their way home, to be ready to feed the hogs in the morning. The rest of the party agreed to camp on the spot. The Cougar was despoiled of its skin, and its carcass left to the hungry dogs. Whilst engaged in preparing our camp, we heard the report of a gun, and soon after one of our hunters returned with a small deer. A fire was lighted, and each hunter displayed his *pone* of bread, along with a flask of whisky. The deer was skinned in a trice, and slices placed on sticks before the fire. These materials afforded us an excellent meal, and as the night grew darker, stories and songs went round, until my companions, fatigued, laid themselves down, close under the smoke of the fire, and soon fell asleep.

At daybreak we left our camp, the squatter bearing on his shoulder the skin of the late destroyer of his stock, and retraced our steps until we found our horses, which had not strayed far from the place where we had left them. These we soon saddled, and jogging along, in a direct course, guided by the sun, congratulating each other on the destruction of so formidable a neighbour as the Panther had been, we soon arrived at my host's cabin. The five neighbours partook of such refreshment as the house could afford, and, dispersing, returned to their homes, leaving me to follow my favourite pursuits.—*Audubon's Ornithology.*

MARINE RAILWAYS.

It has been found from experience that navigable canals are of little or no value for purposes of transmitting large sailing vessels from one sea to another, and thereby cutting off an extensive circuitous route round a promontory of land. The Caledonian Canal, the largest in Britain, which was intended for a purpose of this nature, has turned out almost an entire failure. The necessary dues prevent the entrance of vessels, and, besides, in this, as in other instances, the transmission is not effected with speed. The enormous expense incurred in cutting a canal for the transport of line-of-battle ships, or large merchantmen, will ever prevent this means of communication from being made on so immense a scale. Yet nothing could be more desirable than to establish some mode of conveyance for vessels across and athwart different parts of the island. At present the distance from sea-ports is one of the most serious drawbacks on central parts of the country. Provide a means of bringing ships into the heart of agricultural and manufacturing districts, and you open up new sources of human industry, and new outlets for products of every description. You might then have a flourishing sea-port for the reception of the largest vessels, in districts of the country now in a state of inaction and poverty. It is evident that water cannot be employed as an agent in so magnificent an undertaking. We must turn our attention to the railway. In this we perceive a means of communication, which, sooner or later, is to have the effect of revolutionising the whole economy of trade and

commerce, and stimulating human capabilities in the greatest possible degree.

A writer on this subject in the *United Service Journal* for May 1832, is extremely sanguine in his anticipations of what is to be accomplished by means of those marine railways; no less than projecting the establishment of these lines of communication over Europe, and connected, by a chain bridge across the British channel, with lines radiating all over this country.

"I wish in the following remarks (says he) to exhibit the outline of an extensive project for marine railways, both in this island and the neighbouring European nations; thinking it probable that the world has yet obtained a glimpse only of the revolutionary wonders of the railway system—an invention which is destined to change the civil, commercial, and political condition of every nation on the globe. I first proceed to show that there is neither difficulty nor novelty in raising vessels from the water; and it is apparent that when elevated to the level of the road, any weight may be drawn upon a railway.

By the patent slip, vessels are already drawn from the water up the steepest banks, by horse-power, to the shipyards, three horses being described as equal to the draught of a frigate full masted, and partially in ballast. By stationary steam-engines, and the patent slip, therefore, vessels of any tonnage whatever may be raised from the water; and the track of the railway being formed of the required width and strength of metal, it only remains to attach the locomotive engine, and proceed with the vessel and cradle. Or the descent to the harbour may be graduated for miles, and rendered imperceptible upon the railway, when locomotive engines, or horses alone, will suffice for the conveyance of vessels from the sea to any distance inland. The employment of hydrostatic pressure might be found an economical, speedy, and powerful method of elevating vessels; and equally convenient is the screw-dock, a machine lately introduced into the ports of the United States of America, for the purpose of raising vessels to copper and repair; an invention resorted to in consequence of the insufficiency of water for the formation of dry docks in that country, there not being the same rise and fall of tide in the harbours of America that we have round the coasts of England. The American engineers have not only remedied this deficiency, but greatly surpassed our method; the vessel being elevated to a level with the street, and consequently in a more favourable position for effectually working at the bottom. The screw-dock is still a new and very imperfect machine, being worked by capstans and manual power; but an instance of its great capability is in the circumstance that a vessel of 250 tons burthen, recently arrived in the port of New York, in distress and leaky, and being placed upon the screw-dock, without disturbing the cargo, was raised, repaired, and again dispatched to sea in a single tide. Similar machinery has for a century been employed by the Dutch at the island of Curaçoa, for the transference of vessels from one dock to another; and it is certain that in very ancient times, shipping were conveyed across the isthmus of Corinth: it cannot, therefore, defy the all-conquering mechanical powers of the present age, to accomplish a work which is undoubtedly required to the full development of the commercial advantages of the railway system.

I propose then to form, first, a connected line of marine railways, passing from the southern to the northern counties of the island, and branching to the east and to the west, connecting all our seas.

From Dover to London, at the Thames Tunnel, is the first division of the work; and here a marine railway will save the expensive, circuitous, and dangerous navigation of the Downs and the Thames. The distance is seventy-two miles; and a small steam-engine will convey a vessel of 200 tons to London in about six hours; and at a toll of one farthing per ton per mile, the cost of conveyance will amount to the sum of fifteen pounds, and the expense of the return passage to Dover, an additional sum of fifteen pounds; the whole, therefore, amounting to a charge of thirty pounds. That a toll of one farthing per ton per mile will be a remunerating rate upon this marine railway, is proved by these calculations. The average number of vessels annually entering the port of London is considerably more than twenty thousand, exclusive of lighters, passage-boats, and small craft; and estimating these vessels at an average burthen of 200 tons, and the toll levied upon each being L.30, a revenue of L.600,000 will thus be derived from shipping alone; and the amount to be raised from the conveyance of passengers, mails, and military armaments, with all the local trade of the rich intervening counties of Kent and Surrey, will produce a total revenue of one million per annum. On the other hand, the present expense of sailing and returning from Dover to London, including pilotage, light-money, and all the oppressive and innumerable charges of the Thames, amounts to about L.300 for a vessel of 200 tons. The difference of victualling, wages, and interest upon the value of the vessel and cargo, for a period of seven days, usually occupied in sailing and returning from Dover to London, may be estimated at a further sum of about L.50; and the vessel being conveyed no further than to warehouses in the neighbourhood of the Tunnel, whence railways for wagons may branch off to the various parts of Southwark, Westminster, and London: the present cost of portage from the dock, and of the return cargo to the vessel, an average expense of L.25, will be saved entirely when the vessel is conveyed direct to the warehouse of the merchant. It is

therefore apparent that this marine railway will create a saving of more than L.1, 10s. per ton, which, upon 20,000 vessels of a burthen of 200 tons, amounts to a difference of three millions annually saved to the shipping interest; and, therefore, in the consequent diminution of the price of corn, coal, and all foreign articles of trade, the real result is a perpetual saving of three millions per annum to the consuming population of the kingdom.

Great opposition will undoubtedly be made to any proposal for diverting the trade from the Thames; but as the work will contribute to alleviate the disadvantages of our inland trade, and to diminish the size of this impure place of corruption, monopoly, and unmanageable mobs, the project should be zealously encouraged by government.—Whimsical as these and the preceding statements may appear, they are worthy of the deliberate consideration of the mercantile classes of Britain.

TAPESTRY.—The art of tapestry, as well as the art of illuminating books, aided in diffusing a love of painting over the island. It was carried to a high degree of excellence. The earliest account of its appearance in England is during the reign of Henry VIII.; but there is reason to believe that it was well known, and in general esteem, much earlier. The traditional account, that we were instructed in it by the Saracens, has probably some foundation. The ladies encouraged this manufacture, by working at it with their own hands; and the rich aided by purchasing it in vast quantities whenever regular practitioners appeared in the market. It found its way into church and palace, chamber and hall. It served at once to cover and adorn cold and comfortless walls. It added warmth, and when snow was on the hill, and ice in the stream, gave an air of social snugness, which has deserted some of our modern mansions. At first, the figures and groups which rendered this manufacture popular, were copies of favourite paintings; but, as taste improved, and skill increased, they showed more of originality in their conceptions, if not more of nature in their forms. They exhibited, in common with all other works of art, the mixed taste of the times; a grotesque union of classical and Hebrew history; of martial life and pastoral repose; of Greek gods and distinguished saints. Absurd as such combinations certainly were, and destitute of those beauties of form and delicate gradations, and harmony of colour, which distinguish paintings worthily so called, still, when the hall was lighted up, and living faces thronged the floor, the silent inhabitants of the wall would seem, in the eyes of our ancestors, something very splendid. As painting rose in fame, tapestry sunk in estimation. The introduction of a lighter and less massive mode of architecture abridged the space for its accommodation; and, by degrees, the stiff and fanciful creations of the loom vanished from our walls. The art is now neglected. I am sorry for this, because I cannot think meanly of an art which engaged the heads and hands of the ladies of England, and gave to the tapestried hall of elder days, fame little inferior to what now waits on a gallery of paintings.—*Cunningham's Lives of British Painters.*

ANECDOTE OF THE PLAGUE.—A writer in the *Foreign Quarterly Review* relates the following anecdote of the plague:—"In the village of Careggi, whether it were that due precautions had not been taken, or that the disease was of a peculiarly malignant nature, one after another, first the young, and then the old, of a whole family, dropped off. A woman who lived on the opposite side of the way, the wife of a labourer, the mother of two little boys, felt herself attacked by fever in the night; in the morning it greatly increased, and in the evening the fatal tumour appeared. This was during the absence of her husband, who went to work at a distance, and only returned on Saturday night, bringing home the scanty means of subsistence for his family for the week. Terrified by the example of the neighbouring family, moved by the fondest love for her children, and determining not to communicate the disease to them, she formed the heroic resolution of leaving her home, and going elsewhere to die. Having locked them into a room, and sacrificed to their safety even the last and sole comfort of a parting embrace, she ran down the stairs, carrying with her the sheets and coverlet, that she might leave no means of contagion. She then shut the door, with a sigh, and went away. But the biggest, hearing the door shut, went to the window, and, seeing her running in that manner, cried out, "Good bye, mother," in a voice so tender that she involuntarily stopped. "Good bye, mother," repeated the youngest child, stretching its little head out of the window. And thus was the poor afflicted mother compelled, for a time, to endure the dreadful conflict between the yearnings which called her back, and the pity and solicitude which urged her on. At length the latter conquered; and, amid a flood of tears, and the farewells of her children, who knew not the fatal cause and import of those tears, she reached the house of those who were to bury her. She recommended her husband and children to them, and in two days she was no more."

EDINBURGH: Published, weekly, by W. and R. CHAMBERS, 19, Waterloo Place; ORR & SMITH, Paternoster-row, London; and GEORGE YOUNG, Dublin. Agent in Glasgow, JOHN MACLEOD, 20, Argyle Street; and sold by all Booksellers in Great Britain and Ireland.

Subscribers in town may have the paper left at their houses every Saturday morning, by giving their addresses at 19, Waterloo Place. Price of a quarter of twelve weeks, 1s. 6d.; of a half year of twenty-four weeks, 3s.; and of a year, 6s. 6d. In every case payable in advance.

From the Steam-Press of W. and R. CHAMBERS.

No. 25.

SATURDAY, JULY 21, 1832.

PRICE THREE HALFPENCE.

PAY YOUR DEBT!

JOCK COLQUHOUN was a clever journeyman painter of the famous Old Town of Edinburgh, very much given, unfortunately, to Saturday evening potations, which was the cause why he never found himself, poor fellow, any richer one Monday than another, and generally lived during the rest of the week in, to say the least of it, a very desultory manner. Jock was a long slip of a lad, with a bright intelligent face, and a woefully battered hat, and the whole man of him was encased, from neck to heel, in one glazed suit—I was going to say, of clothes, but I should rather say, of oil-paint; for, to tell the truth, his attire consisted rather more of the one material than the other. He was universally reputed as a very clever workman; but, then, every body said, what matters it that he can make five shillings a-week more than any of his fellow journeymen, if he is sure every Saturday, when he gets his wages, to go upon the scuff, and so pass the half of the week in spending, not in gaining? Jock, however, had many good points about him; and it was perhaps less owing to his own dispositions than to the influence of evil company, that he got into such bad habits. He was such a good fellow that he would at any time part his money with an old crony out of bread, or treat to a can or a bottle any working brother who had got through his money a little before him, and who happened to feel rather dry upon some sunshiny Wednesday. In his profession he was matchless at all superior kinds of work. If his employers had any thing to do that required an extraordinary degree of taste or dexterity, Jock was set to it, and he invariably managed it (beer and whisky aside) to their entire satisfaction. Jock might have long ago been foreman to his masters; nay, he might have set up as a general artist, and, with perseverance equal to his talent, would have been sure to do well. But gill-stoups were his lions in the way, and the deceitfulness of drink had beset him; and Jock, from year to year, was just the same glazed and battered, but, withal, rather spruce-looking, fellow as ever.

It would have been altogether impossible for any such man as Jock to carry on the war, if he had not had one howf,* above all others, where he enjoyed a little credit. This was an eating-house in the Canon-gate, kept by one Luckie Wishart, a decent widow of about forty, with four or five children, who had been pleased to cast an eye of particular favour upon the shining exterior of our hero. A pot sabbie upon a ground argent pointed out this house to the passers by, even if they had not been informed of its character by the savoury steam which always proceeded from it between the hours of one and five p.m., and certain spectral and unfinished pies which ran in a row along the sole of her little window, level with the street, as well as a larger display of the same article on a board half way down her somewhat steep and whitewashed stair. Luckie Wishart also sold liquors; but she was far too respectable a person to let Jock spend his wages at one house in her house. She always, as she said, shanked him off, whenever he came there of a Saturday night, and it was only when his pockets were empty, and no provisions to be had for the working days of the week, that he resorted to her. Generally about the Tuesdays, Jock came briskly down into her culinary Tartarus, quite sobered and hungry, sending his voice briskly along the passage before him, as if defending himself by anticipation from a shower of reproaches which he knew she would bestow upon him:—"Nothing of the kind," he would cry; "no-thing of the kind—all a mistake—pon my honour." There was generally, it may be supposed, fully as much scolding and railing as he could have anticipated; but the end of the jest always was, that Jock got snug into some corner of Luckie's own particular den, where he was regaled with a plate of something or other, garnished always with a few last words of rebuke from the lady, like the droppings after a thunder-storm, which he always contrived, however, to stomach with his beef, without manifesting any very great degree of irritation. There is something ominous in the act of drawing in one's stool at the fireside of a comfortable widow. It is apt to make a young man feel rather ticklish, even although he may never have thought of her before, except as a good cook. So it was with Jock, and the idea might have been fatal to

his visits to Luckie Wishart's (for, to speak the truth, she was no great beauty), if dire hunger, which tames lions, had not absolutely compelled him to continue the practice. In general, when Jock came in with his week's gains, he flung a few shillings upon the dresser, as part payment of what he had ate and drank during the past few days, reserving the rest for the bouse-royal. But, notwithstanding all these occasional deposits to account, his score got always the longer the longer, until it at last went fairly off at the bottom of a cupboard door, and had to be "brought forward" on the end of a chest of drawers.

"That's a shocking bad hat you've got," said Luckie to him one day, without any idea that she was anticipating a favourite English phrase by some years. "Of course, there's nae chance of such a drucken blackguard as you ever being able to buy a new ane. But what wad ye say, John, if I were to gie ye ane mysel'?"

"I would say, much obliged t'ye, ma'am," answered Jock, now for the first time in his life called by his proper Christian name.

"Here is one, then," said the widow, and at the same time produced a decent-looking chapeau, which, she said, had belonged to him that was away—meaning her late husband—and had only been three times on his head at the kirk, when, puir man, he was carried without it to the kirkyard.

Jock accepted the hat with great thankfulness, and made his old one skimmer into Luckie's fire, where, it is needless to say, it was speedily roasted in its own grease.

"Dear sake, Jock, man," said Mrs Wishart, some days afterwards, "what kind o' a landlady hae ye got at hame? She maun be nae hand at the shirts, I reckon; for fient a bit can ane ken ye on a Monday frae what ye are on a Saturday. Ye may be as touzle as ye like i' the outside o' your claes; but I wad aye like to see a man decent-like next the skin."

"Deed, mistress," said Jock, "to let ye into a secret, I have nae great stock o' linen, and whiles Mrs Ormiston's wee hurried in getting a shirt ready for me. I'm a gude deal between the hand and the mouth in that respect."

"Ye're just the greatest ne'er-do-weel that ever I kened," replied Mrs Wishart; "but yet, reprobate as ye are, I canna think o' seeing ye gaun that gate frae ae week's end to another. Here's four gude shirts that I hae unco little use for now-a-days. Better ye should wear them, than that they should gang to the moths. Tak them hame wi' ye, man, and mak yoursel' something trig, and dinna gang to think that I'm aye to be gie'ing ye the buffet without the bite."

Jock did as he was bid, and towards the end of the week Luckie Wishart asked him "if he ever thought o' taking a walk on a Sunday evening wi' his lass to Restalrig, to treat her wi' curds and cream, or ony thing o' that kind."

"Oh, I daresay I have, mistress," said Jock, "in my day. But," added he, looking askance at his resplendent sleeves, "somehow or other I've fallen out of a suit of Sunday claes, and, of course, nae lass 'll gang wi' a chiel like a beggar."

"Weel, Jock," said the lady, "I think ye canna do better than just step into my auld gudeman's claes bodily, and let us hae nae mair wark about it."

This was accompanied with a look so significant, that Jock could not pretend to misunderstand it. He all at once felt as if the stool which he had drawn in towards the fireside was burning under him, while all the burnished covers on the opposite wall looked like so many moons dancing in troubled water. "Od, mistress," he stammered out, "are ye serious?"

"Ay, that I am," answered she; "and dinna let your modesty wrang ye, my man, an' ye be wise. Ye see every thing here ready to your hand; and if ye just be steady a bit, as I'm sure ye will be, wi' me to look after baith your meat and your winnings, ye may be the snugest painter lad in the town. What wi' what ye can make, and what wi' what I can make, we'll be very weel, or I'm muckle mista'en."

"But, Luckie," said Jock, "I maun get my ain consent first; and that, I'm feared, it'll not be sae easy to get. There was a lass —"

"Oh, very weel, John," said Mrs Wishart; of course, ae man may lead a horse to the water, but twenty winna gar him drink. There's some folk that dinna ken what's gude for them, and ye're ane o'

them. But see, lad," she added, opening up the cupboard door, "what a score ye hae here! Twa pounds fifteen shillings and eightpence. When will ye be gaun to pay that?"

"I suppose I maun pay't when I can," said Jock, striding sturdily up stairs into the street.

Next day he was served with a summons to the sheriff's court for two pounds fifteen shillings and eightpence; and as he never appeared to dispute the claim, a writ was allowed against him, warranting either the incarceration of his person, or the distraining of his goods. Goods Jock had none; his person therefore came into immediate request among certain individuals of whose companionship he was not ambitious. It would be vain to tell all the strange miracles by which he was enabled for some weeks to elude the pursuit instituted against him. Sometimes as the officers were entering at the door, he was escaping by the back windows. Once he had to drop himself down two stories into an alley. At another time he sprang across a gulf about ten feet wide, between two garret windows, nine floors from the ground. This course of life could not continue long. He could not get rest any where to pursue his ordinary business, and of course he soon found himself upon very short allowance both as to meat and drink. Just at this crisis, Jock heard of an expedition which was about to sail from Leith, for the purpose of colonising Poyais, and through the intervention of an old chum, who was going thither, he was permitted to join the corps. On the night before the vessel was to sail, he skulked down to Newhaven, and got on board along with the family of his friend. He now, for the first time during three weeks, found himself, as he thought, safe from the avenging persecution of Luckie Wishart. For one happy night he slept amidst a parcel of sacks in a corner of the cabin, surrounded on all hands by squalid and squalling children, whose cries, however, were nothing to the dread which he had recently entertained for the fell Dido of the Canongate. Next morning the sun rose bright, the sails were set loose, the heart of every man on board beat high with hope, and Jock's bosom's lord sat lightly on his throne—when, oh manacles and fetters! a boat came alongside containing a whole bevy of sheriff's officers. Jock now thought that it was all over with him; for, simple man, he believed that he was the sole individual in request. The case, however, was quite different.

On a demand being made for admission into the vessel, the whole of the passengers, with one consent, raised their voices against it. "What! let these fellows in—as well give up the whole expedition!" The officers pleaded to have at least a representative sent on board, to show their case to the captain, which, after a great deal of difficulty, was consented to. One messenger was accordingly hoisted on board, and proceeded to call the names of the persons for whom they had captions—Jock Colquhoun among the number. But personalities of this kind were not to be endured. The passengers rose in absolute mutiny against the captain, demanded that he should instantly proceed on the voyage, even although one member of the expedition was yet to join; and as they feared to let the boat once more approach the vessel, they insisted that the messenger should be retained where he was, and carried out to Poyais and back again, as a punishment for his temerity. It was a mad affair altogether, and so small an addition to the general phrenzy was of little moment. So the boat-swain, or somebody else, "gave the dreadful word," and, notwithstanding all the remonstrances of the *detenú*, which were both loud and vehement, the lessening boat of the officers was soon seen unwillingly rowing to land, while, instead of any white hand to wave adieu to those on board, the fist of big Pate Forsyth, the chief of the fraternity, was observed shaking in impotent rage over the stern, as much as to say to the captain, "If ever you come back to Leith, ye ken what ye'll get."

Jock soon found himself tolerably comfortable in his new situation. He had, no doubt, come on board without much luggage, and he was still the same greasy Pic as ever in respect of his attire. But then he was not, after all, much behind his neighbours; for if ever a fit garrison for the cave of Adullam was collected since the days of King David, it was this ship's company. The whole set resembled a troop of strolling players, going to act a grand historical drama

* Alehouse of particular resort.

in some country town. A gentleman in tartan trousers was to be a kind of Cincinnatus, alternating between the plough and the cares of state. A young lad, in a blue bonnet, was to be Chamberlain, and Supreme Director of Literature and the Arts. Another carried with him all the materials of a bank, except credit and specie. The other characters and properties, to speak theatrically, were all on the same scale; and if a state could have been founded as easily as a castle of cards is built, or a puppet-show set in motion, Poyais could have immediately taken its place among the nations of the earth. In such a system it was easy to find a place for Jock. The Chamberlain was good enough to divest himself, in favour of this new friend, of that part of his commission which referred to the fine arts. Jock was therefore styled from this day forward, Director Colquhoun; and every one, including himself, agreed that the case could have only been improved, if he had happened to have any paints. However, nobody pretended to doubt that, so far as the fine arts could be cultivated without materials, Mr Colquhoun would prove himself an efficient member of the corps.

The voyage was a pleasant one, and during the whole time nothing was to be heard in the vessel but psalms of homage and gratitude to the Cazique Macgregor, who had sent them out to take possession of his territories. The only individual who did not partake of the general joy was the poor *detenú*, whose long gaunt person did not agree with a tropical climate, and who, therefore, sickened and threatened to die before reaching the land. It was in vain that the Chamberlain promised to make him Lord High Constable of the kingdom, if he would only keep up his spirits. Like the poor sparrow, who, in its last moment, refuses the very finest crumbs held to its mouth, he said it was all humbug to make him these offers, when it was clear he could never live in such a hot part of the world as this. He would lay his death, he said, to their door, and, if at all possible, he would be sure to haunt them after death. To the great grief of the company, the unfortunate messenger died on the very day when they cast anchor off the shores of Poyais.

About seventy or eighty individuals, from the Old Town of Edinburgh—forming the staff of a great empire—now landed on a flat bushy part of the Mosquito Territory—ominous name!—in the Bay of Honduras, with the expectation of immediately falling into the enjoyment of all the luxuries and pleasures which this world can bestow. They were, indeed, somewhat surprised to find that every thing was still in its primeval state, and that even their houses were as yet to be built. However, having found one small opening in the forest of brushwood, they established themselves there, with such goods and chattels as they had; and their first duty was to give a decent burial to the *detenú*, whose body they had brought ashore for that purpose. A grave having been dug, the Chamberlain, assuming the character of High Priest of the kingdom, for want of a better, mounted an old shirt over his clothes, by way of sacerdotal vestment, and proceeded to read the funeral service of the church of England over the body. In the very middle of the most solemn part of this ceremony, a large bird, with a curious beaky face, somewhat resembling that of the deceased, alighted upon a tree immediately above the funeral group, and cried, with a loud shrill voice, what was interpreted by all present (with the aid, no doubt, of a stricken conscience) into the phrase, "Pay your debt!"

The colonists saw and heard with terror, believing that the spirit which had lately animated the body before them was now addressing them in character, according to his threat before death; and, but for the protection which daylight always gives to the superstitious, the whole set, including both the civil and military departments of the state, would have fled from the spot. The Chamberlain saw the nature of the case, and drew hurriedly towards a conclusion; but yet, at every brief pause of his voice, there still came in the ear-piercing cry, "Pay your debt!" Before the grave had been closed, another and another bird of the same species drew towards the spot, and each lifted up his voice to the same tune—"Pay your debt!"—"Pay your debt!"—"Pay your debt!"—till the whole forest seemed possessed by one spirit, and the ghost of the sheriff's officer appeared to the distracted senses of the settlers to have dispersed itself into a whole legion of harpies. The fact was, that the birds were brought forth by the coolness of the evening, according to their usual habits, and were now innocently amusing themselves with their accustomed cry, without the least idea of any personality towards the Poyaisians. The Chamberlain of the colonists, who had learned from books of travels that many American birds uttered something like a sentence of English as their habitual cry, endeavoured to assuage the alarm of his companions; but, nevertheless, a very general sense of terror remained.

"It may be all very true," said Jock Colquhoun, "that the birds of this country have each a particular word to say; but, od, it's gyan queer that the Poyais bird should have pitched upon a thing that jags our consciences sae sair."

The first night was spent in a very uncomfortable manner. To a day of intense heat succeeded a cold dewy night, which struck the limbs of the unprotected settlers with such severe cramps, that hardly a man could stir next morning. Their sleep, moreover, was

broken occasionally by the cry of "Pay your debt!" which a few of their feathered friends kept up at intervals all night. Next day, instead of setting about the erection of their metropolis and sea-port, as was intended, they had to attend each other's sickbeds. Before night several of the women and children had expired. Next day, and the next again, the same sickness continued; and in less than a week half their number were under the earth. Jock, who had fortunately escaped every mishap except a rheumatic shoulder, now began to think how much more comfortable he would have been in Luckie Wishart's *laigh shop* in the Canongate of Edinburgh, than he was on this inhospitable coast, where there was no prospect of raising so much as a potato for a twelve-month. "What I fool I was," said he, "not to make my quarters good there, as the honest woman proposed! Oh, to be walking wi' her down the King's Park on a Sunday night, even wi' a' the five bairns running after us! I se warrant the gardens at Restalrig hae nae birds about the bushes that tell folk to pay their debt: naething o' the kind there, unless it be the board, black letters on a white ground, that says, 'Pay on delivery.'"

Hardship had now dispelled from every mind the magnificent ideas with which they had hitherto been inspired. If the vessel had yet remained on the coast, the whole of the surviving company, prime minister and all, would have willingly exchanged their brilliant appointments under the Cazique for a snug berth on board. But it had departed immediately after landing them; and there only remained the chance that some other vessel would pass that way, and take pity on their distress. This, fortunately, happened in the course of a few days. A vessel bound to Balize came along the shore; and, on a signal from the unfortunate Poyaisians, sent a boat to inquire into their case. As only a few remained alive, it was soon arranged that they should be carried to the port for which the vessel was bound. With grateful and subdued hearts, and casting many a mournful glance towards the graves of their friends, the small remnant of the Poyais expedition betook themselves to the boat, and sailed off to the vessel. As a sort of parting admonition, a bird came up at the moment of their departure from the land, and, pronouncing one shrill, clear "Pay your debt!" flew off into the interior.

It were needless to relate the various hardships and adventures which befel Jock Colquhoun before he regained his native shore. Be it enough, that he immediately sought the cosy den of Luckie Wishart, and paid his debt in the way originally desired by the lady, who, under the name of Mrs Colquhoun, continued for many years, with the assistance of her reformed husband, to regale the good people of the Canongate.

"A flitchy chield," she used to remark to her female friends, "was whyles the better o' finding the grund o' his stamack."

POPULAR INFORMATION ON LITERATURE.

THE ENGLISH LANGUAGE.

THE principal languages of Western Europe are formed from the Latin, with a greater or less mixture of northern dialects. The Irish, Gaelic, Welsh, Manx, and Basque, are vestiges of the language spoken by the Celtic Gauls who first peopled these parts of the globe. The Welsh is the principal surviving type of the tongue used by the Cimbric Gauls, the second great wave in the tide of immigration. The Spanish, Portuguese, and Italian, are almost exclusively the dialects of Roman provincials; the modern French contains a larger proportion of words derived from a northern source, while, in our own language, the majority is on the side of the Saxon, and the Roman appear as the tributary terms. This arose from the circumstance of the complete withdrawal of the legionaries from the island, and the nationalising system of conquest pursued by the Saxons, who afterwards became masters of the country. These latter, as we are told by the old historians, had no sooner obtained the predominance in any district, than they compelled the former inhabitants either to depart, or Saxonise, i. e. adopt the Saxon language, dress, and customs. Saxon in consequence became for nearly eight hundred years the universal language of the island, from the Forth to the Tamar, and the Severn to the British Channel. It was the vehicle of the laws which still form the foundation of English jurisprudence, and boasted no contemptible literature. The conquest of the island, however, by the Roman provincials of Gaul, driven home by the invading Northmen, introduced the corrupted Latinity of the province as the dialect of the conquering castes. Years rolled on before any amalgamation took place between the races, and of course between the languages of the conquerors and the conquered. The pressure of a common danger in the protracted struggle between King John and his son, on the one part, and the barons, joined by the people, on the other, rapidly effected what time alone seemed scarcely capable of accomplishing. The reign of Henry III. saw the birth of our language, and Edward I. was the first monarch who reigned over a people united by identity of tongue, and the common title of *Englishmen*. The numerical proportion of the foreigners was small, and thus the bulk of the language was that of the commonalty, while the superadded French-Latin, though it still lingered in the court and the halls of justice, enriched us with new terms, without modifying to any important extent the Saxon forms of construction.

The growth of the mighty infant was suitable to its lofty destinies. It was no puny bantling prematurely thrust into an ungenial climate. It had become necessary for a people on whom opulence, arts, and glory were showering their choicest gifts, and the third generation saw it employed as a vehicle for the variety, the grace, the harmony, of Chaucer. From this period it underwent no material change, and received very dubious improvement, until the revival of learning in the sixteenth century. This great event was but one step in a mighty revolution, which, as it gave a new impulse to the intellectual energies of nations, could not but produce a corresponding effect upon their languages. The discovery of printing, we should perhaps rather say of paper, the disinterment of ancient literature, and the comparative emancipation from mental thralldom effected by the Reformation, were events which not only gave birth to a crowd of new ideas, but disseminated existing knowledge over a circle infinitely more extended than before.

The vast accession of words, drawn from classical sources, which was at this period made to our language, gave it, for a time, rather massive power than pliancy or grace. The prevailing style of the period is voluminous and unwieldy, stiff in its movements, impeded by foreign ornament, and a clumsy attempt at imitating the stately march of the ancients.

It is observable that the compilers of the Liturgy of the English Church, who wrote for the people at large, appear to have been fully aware of the distinction between the new and old forms of expression, and to have studiously coupled them, as if to familiarise the lower orders with the sound and meaning of the terms. Thus we find in the introductory exhortation, "acknowledge and confess," "assemble and meet together," "humble and lowly," placed in explanatory juxtaposition, the one expression being in every case Saxon, the other Latin, but both precisely synonymous.

Some writers, indeed, contemporary with Hooker and Bacon, wrote prose which may vie in elegance and spirit with the style of any later writer, and this character will particularly apply to some passages in that wonderful work, Raleigh's History of the World. In general, however, we may safely say that a century elapsed before the additions made to our language at the revival of learning were so far assimilated and incorporated as to form part of its proper and inseparable substance. The poem, *Paradise Lost*, was written when the language had newly assumed its modern character and form; and the poet, with exquisite taste, has retained precisely so much of the old classical brocade as to give dignity and picturesque effect to his style, without any violation to the analogies of the popular language. To estimate the judgment and philosophical knowledge of language necessary to accomplish this, we have only to compare the style of the *Paradise Lost* with the more laboured passages of Shakspeare, and with the Fairy Queen. Milton is always elevated, often archaic, for the time at which he wrote. Shakspeare, in attempting elevation, with the materials of the language yet crude before him, frequently becomes stiff, cumbersome, and wearisome; and Spenser, in the effort to throw an air of antiquity over his work, has invented a lingo which never was and never could have been spoken by the people of this island.

To form any just idea of the distinctive characters of the English language, it should be studied in at least the following authors. Its native and idiomatic form can nowhere be so perfectly traced as in Swift, who studiously weeded words of direct Latin formation from his compositions, and scrupulously adhered to the forms of ordinary conversation. His language is therefore the most universally intelligible to natives of any author we can name. Among our present English writers must also be named Addison, Goldsmith, and Fielding, who has given us, in the introductory chapters to the books of Tom Jones, some of the most perfect specimens of graceful English we can refer to. In Dr Johnson we may see the utmost that can be done with the English language on the opposite system of adapting it to a classical model, and investing it with the gorgeous magniloquence of Rome. The example, however, is a warning. The effect is always against the natural genius of the tongue, and, like all similar attempts, will much more probably terminate in a ridiculous failure than in success. Bolingbroke and Gibbon have proved it equal to the highest objects of the orator, statesman, and historian; and it has not degenerated in our own times in the hands of Canning and Southey. Those who are perfectly acquainted with the principal works of the four last-named authors may have an adequate conception of the powers of the English language, its boundless variety and sincerity of expression, its exquisite adaptation to all the highest purposes for which language is employed by man.

Such is a rapid sketch of the history of our tongue. Its principal peculiarities of construction are to be traced to its Saxon origin. Rejecting the classical mode of indicating the various circumstances under which things and actions must be spoken of by changes of termination, it prefers the use of prepositions and auxiliary words of different descriptions. The indirect construction of a Roman sentence, suspending the whole interest or meaning on the conclusion; is therefore impracticable; no construction depending solely upon a variation of case—such as the "absolute" constructions of the classical grammarians—can be to-

lated, since they are utterly unmeaning to the mere English ear. One necessary consequence of our perpetual employment of auxiliaries is, that the adverb must be interposed between the auxiliary and the principal verb, a source of incredible confusion to a foreigner accustomed to regard the auxiliary and its verb as signs of an indissoluble form.

To attempt to give any formal character of a language is idle. Draw the character of the people who employ it, and the character of the language may be inferred as certainly as the shape of an object from the form of its shadow. He who has studied the successive changes through which a language has passed, may trace the changes in the national habits, manners, and character with unerring precision, and he who neglects to draw such information from his acquisitions as a linguist, has passed over the most valuable results his labours might have afforded him. Those who boast the name of Britons may well be proud of a language which could never have been formed or employed but by a free-born and enlightened people. Its history hitherto has been glorious; it has already accumulated an unrivalled literature, but the splendours of its destiny baffle the imagination. It is already the native tongue of the dominant race in two opposite hemispheres, and the remotest descendants of empires yet unborn, dwelling among the untrodden wildernesses of America, or lording it over continents yet buried in the bosom of the Pacific, will refer to the literature of England as the cradle of their laws, their language, and their customs.

NOW.

AN ARTICLE FOR THE DOG-DAYS.—BY LEIGH HUNT. Now the rosy- (and lazy-) fingered Aurora, issuing from her saffron house, calls up the moist vapours to surround her, and goes veiled with them as long as she can; till Phoebus, coming forth in his power, looks every thing out of the sky, and holds sharp uninterupted empire from his throne of beams. Now the mower begins to make his sweeping cuts more slowly, and resorts oftener to the beer. Now the carter sleeps a-top of his load of hay, or plods with double slouch of shoulder, looking out with eyes winking under his shading hat, and with a hitch upward of one side of his mouth. Now the little girl at her grandmother's cottage door watches the coaches that go by, with her hand held up over her sunny forehead. Now labourers look well, resting in their white shirts at the doors of rural alehouses. Now an elm is fine there, with a seat under it; and horses drink out of the trough, stretching their yearning necks with loosened collars; and the traveller calls for his glass of ale, having been without one for more than ten minutes; and his horse stands wincing at the flies, giving sharp shivers of his skin, and moving to and fro his ineffectual docked tail; and now Miss Betty Wilson, the host's daughter, comes streaming forth in a flowered gown and ear-rings, carrying with four of her beautiful fingers the foaming glass, for which, after the traveller has drank it, she receives with an indifferent eye, looking another way, the lawful twopence: that is to say, unless the traveller, nodding his ruddy face, pays some gallant compliment to her before he drinks, such as "I'd rather kiss you, my dear, than the tumbler," or "I'll wait for you, my love, if you'll marry me;" upon which, if the man is good-looking and the lady in good humour, she smiles and bites her lips, and says, "Ah! men can talk fast enough;" upon which the old stage-coachman, who is buckling something near her, says, in a hoarse voice, "So can women too, for that matter;" and John Boots grins through his ragged red locks, and doats on the repartee all the day after. Now grasshoppers "fry," as Dryden says. Now cattle stand in water, and ducks are envied. Now boots and shoes, and trees by the road-side, are thick with dust; and dogs rolling in it, after issuing out of the water, into which they have been thrown to fetch sticks, come scattering horror among the legs of the spectators. Now a fellow who finds he has three miles further to go in a pair of tight shoes, is in a pretty situation. Now rooms with the sun upon them become intolerable; and the apothecary's apprentice, with a bitterness beyond aloes, thinks of the pond he used to bathe in at school. Now men with powdered heads (especially if thick) envy those that are unpowdered, and stop to wipe them up hill, with countenances that seem to expostulate with destiny. Now boys assemble round the village pump with a ladle to it, and delight to make a forbidden splash, and get wet through the shoes. Now also they make suckers of leather, and bathe all day long in rivers and ponds, and follow the fish into their cool corners, and say millions of "my eyes!" at "tittle-bats." Now the bee, as he hums along, seems to be talking heavily of the heat. Now doors and brick walls are burning to the hand; and a walled lane, with dust and broken bottles in it, near a brick-field, is a thing not to be thought of. Now a green lane, on the contrary, thick set with hedge-row elms, and having the noise of a brook "rumbling in pebble-stone," is one of the pleasantest things in the world. Now youths and damsels walk through hay-fields by chance; and the latter say, "ha' done then, William;" and the overseer in the next field calls out to "let thic thear hay thear bide;" and the girls persist, merely to plague "such a frumpish old fellow."

Now in town, gossips talk more than ever to one another, in rooms, in doorways, and out of windows, always

beginning the conversation with saying that the heat is overpowering. Now blinds are let down, and doors thrown open, and flannel waistcoats left off, and cold meat preferred to hot, and wonder expressed why tea continues so refreshing, and people delight to sliver lettuces into bowls, and apprentices water doorways with tin canisters that lay several atoms of dust. Now the water-cart, jumbling along the middle of the streets, and jolting the showers out of its box of water, really does something. Now boys delight to have a water-pipe let out, and set it bubbling away in a tall and frothy volume. Now fruiterers' shops and dairies look pleasant, and ices are the only things to those who can get them. Now ladies lotter in baths; and people make presents of flowers; and wine is put into ice; and the after-dinner lounge recreates his head with applications of perfumed water out of long-necked bottles. Now the lounge, who cannot resist riding his new horse, feels his boots burn him. Now buckskins are not the lawn of Cos. Now jockies, walking in greatcoats to lose flesh, curse inwardly. Now five fat people in a stage-coach hate the sixth fat one who is coming in, and think he has no right to be so large. Now clerks in offices do nothing but drink soda-water and spruce-beer, and read the newspaper. Now the old clothes-man drops his solitary cry more deeply into the areas on the hot and forsaken side of the street; and bakers look vicious; and cooks are aggravated; and the steam of a tavern kitchen catches hold of one like the breath of Tartarus. Now delicate skins are beset with gnats; and boys make their sleeping companions start up, with playing a burning-glass on his hand; and blacksmiths are super-carbonated; and cobblers in their stalls almost feel a wish to be transplanted; and butter is too easy to spread; and the dragoons wonder whether the Romans liked their helmets; and old ladies, with their lapets unpinned, walk along in a state of dilapidation; and the servant-maids are afraid they look vulgarly hot; and the author who has a plate of strawberries brought him, finds that he has come to the end of his writing."—Indicator.

MEDICINAL AND NUTRITIOUS PROPERTIES OF THE SUGAR-CANE.

DUTRONE calls sugar the most perfect alimentary substance in nature, and the testimony of many physicians establishes the fact. Dr Rush, of Philadelphia, says, in common with all who have analysed it, that "sugar affords the greatest quantity of matter of any subject in nature." Used alone, it has fattened horses and cattle in St Domingo for a period of several months, during the time when the exportation of sugar and the importation of grain were suspended from the want of ships. The plentiful use of sugar in diet is one of the best preventives that ever has been discovered of the diseases which are produced by worms. Nature seems to have implanted a love for this aliment in all children, as if it were on purpose to defend them from those diseases. Sir John Pringle tells us that the plague has never been known to visit any country where sugar composes a material part of the diet of the inhabitants. Dr Rush, Dr Cullen, and many other physicians, are of opinion that the frequency of malignant fevers of all kinds has been lessened by the use of sugar. Dr Rush observes, that in disorders of the breast, sugar is the basis of many agreeable remedies, and it is useful in weaknesses and acrid defluxions in other parts of the body. The celebrated Hoenchin recommends "eau sucrée" for almost every malady. Dr Fothergill was very anxious that the price of sugar should be sufficiently moderate, to render it accessible to the mass of the people. From experiments made by some eminent French surgeons, it appears to be an antiscorbutic; and this is confirmed by well-known facts. A writer from India observes, "The comfort and health arising to a poor family from a small patch of sugar-cane, exclusive of what the jaggy may sell for, can only be known to such as may have observed them in the time of cutting the canes, and noted the difference of their looks before the crop begins, and a month or six weeks after. The Cochinchinese consume a great quantity of sugar; they eat it generally with their rice, which is the ordinary breakfast of people of all ages and stations. There is little else to be obtained in all the inns of the country but rice and sugar; it is the common nourishment of travellers. The Cochinchinese not only preserve in sugar all their fruits, but even the greater part of their leguminous vegetables, gourds, cucumbers, radishes, artichokes, the grain of the lotus, and the thick fleshy leaves of the aloë. They fancy nothing is so nourishing as sugar. This opinion of its fattening properties has occasioned a whimsical law. The body-guard of the king, selected for the purposes of pomp and show, are allowed a sum of money with which they must buy sugar and sugar-cane, and they are compelled by law to eat a certain quantity daily. This is to preserve the *embonpoint* and good looks of those soldiers who are honoured by approaching so near the person of the king; and they certainly do honour to their master by their handsome appearance. Domestic animals, horses, buffaloes, elephants, are all fattened with sugar-cane in Cochinchina. Sugar has been found to be an antidote to the poison of verdigris, if taken speedily and in abundance; and unlike many other organic substances, its nutritious qualities are not liable to change, from the operations of time or season."—Porter's Treatise on the Sugar-cane.

PROFANE HANDLING OF SACRED THINGS.

LET me caution all, and especially my young hearers, how they treat the Sacred Scriptures. There is a loose mode of speaking of the Bible, which is subversive of its influence. Some persons, in mere thoughtlessness, some out of an affectation of superior wit and cleverness, others to show their being above the restraints of what they deem common minds, are wont to sport profanely with sentences taken from the sacred book. Ludicrous anecdotes, in which an extravagant and sinful application of texts is made, are retailed from one to another. Stories are narrated which have their peculiar jest, edged and sharpened by the phraseology of the Bible; and thus the most solemn words and awful things are associated with merriment and mad folly. Now, as you have any belief in the Divine authority of "the things revealed," as you know that they relate to the judgment-seat of God, and to the appearing of your soul there; as you are persuaded that they are truths in the reception of which your eternal welfare is concerned, be you warned on this head. The practice of jesting with the sacred Scriptures is most offensive to God, most hurtful to those you converse with, most ruinous to your own souls. It shakes good principles, wears off the impression of awe which religious truth may have made, and is employing the most effectual means of searing the conscience, and bringing on the dreadful visitation of a reprobate sense. For, can it be thought that the Divine Spirit will not be "grieved," and be led, righteously, to withdraw his influence wherever "despite is done," to that very word which He dictated, and which he employs as the instrument of his greatest work on earth, the conversion and renewal of the soul that is "dead in trespasses and sins." I beseech you treat "the things revealed"—ever treat them with reverence and awe. Quote them on no vain trifling occasion. Associate them not in your minds with aught but what is dignified and holy; speak of them as the discoveries of the will of God ought to be spoken of; and remember that they are made known to you for your salvation, and that every instruction conveyed by them, every warning and promise which they hold out to you, shall form the subject of the last and solemn account which you have to render.—Dr Muir's Sermons.

TRADITIONS AND ANECDOTES OF THE BAGPIPE.

THERE is at Rome a fine Greek sculpture, in basso relievo, representing a piper playing on an instrument bearing a close resemblance to the Highland bagpipe. The Greeks, unwilling as they were to surrender to others the merit of useful inventions, acknowledge, that to the barbarians—i. e. the Celts—they owed much of their music, and many of its instruments. The Romans, who no doubt borrowed the bagpipe from the Greeks, used it as a martial instrument among their infantry. It is represented on several coins, marbles, &c.; but, from rudeness of execution, or decay of the materials, it is difficult to ascertain its exact form. On the reverse of a coin of the Emperor Nero, who thought himself an admirable performer on it, and who publicly displayed his abilities, the bagpipe is represented. An ancient figure, supposed to be playing on it, has been represented, and particularly described, by Signor Macari, of Cortona, and it is engraved in Walker's History of the Irish Harps; but it does not, in my opinion, appear to be a piper. A small bronze figure, found at Richborough, in Kent, and conjectured to have been an ornament of horse furniture, is not much more distinct. Mr King, who has engraved three views of it, and others, believe it to represent a bagpiper, to which it has certainly more resemblance than to a person drinking out of a leathern bottle.

The bagpipe, of a rude and discordant construction, is in common use throughout the East; and that it continues the popular instrument of the Italian peasant, is well known. In this country it is the medium through which the good Catholics show their devotion to the Virgin Mother, who receives their adoration in the lengthened strains of the sonorous Piva. It is a singular but faithful tradition of the church, that the shepherds who first saw the infant Jesus in the barn, expressed their gladness by playing on their bagpipes. That this is probable and natural, will not be denied; but the illuminator of a Dutch missal, in the library of King's College, Old Aberdeen, surely indulged his fancy when he represented one of the appearing angels likewise playing a salute on this curious instrument. The Italian shepherds religiously adhere to the laudable practice of their ancestors; and in visiting Rome and other places to celebrate the advent of our Saviour, they carry the pipes along with them, and their favourite tune is the Sicilian Mariners, often sung in Protestant churches.

It is the popular opinion that the Virgin Mary is very fond and is an excellent judge of music. I received this information on Christmas morning, when I was looking at two Calabrian pipers, doing their utmost to please her, and the infant in her arms. They played for a full hour to one of their images, which stands at the corner of a street. All the other statues of the Virgin which are placed in the streets, are serenaded in the same manner every Christmas morning. On my inquiring into the meaning of that ceremony, I was told the above-mentioned circumstance of her character, which, though you have always thought highly probable, perhaps you never be-

fore knew for certain. My informer was a pilgrim, who stood listening with great devotion to the pipers. He told me, at the same time, that the Virgin's taste was too refined to have much satisfaction in the performance of these poor Calabrians, which was chiefly intended for the infant; and he desired me to remark, that the tunes were plain, simple, and such as might naturally be supposed agreeable to the ear of a child of his time of life.

How many anecdotes might be given of the effects of this instrument on the hardy sons of Caledonia! In the war in India, a piper in Lord M'Leod's regiment, seeing the British army giving way before superior numbers, played, in his best style, the well-known "Cogadh na Sith," which filled the Highlanders with such spirit, that, immediately rallying, they cut through their enemies. For this fortunate circumstance, Sir Eyre Coote, filled with admiration, and appreciating the value of such music, presented the regiment with fifty pounds to buy a stand of pipes. At the battle of Quebec, in 1760, the troops were retreating in disorder, and the general complained to a field-officer in Fraser's regiment of the bad conduct of his corps. "Sir," said the officer, with a degree of warmth, "you did very wrong in forbidding the pipers to play; nothing inspirits the Highlanders so much; even now they would be of some use." "Let them blow, in God's name, then!" said the general; and the order being given, the pipers with alacrity sounded the Cruinneachadh, on which the Gael formed in the rear, and bravely returned to the charge. George Clark, now piper to the Highland Society of London, was piper to the 71st regiment at the battle of Vimera, where he was wounded in the leg by a musket ball as he boldly advanced. Finding himself disabled, he sat down on the ground, and putting his pipes in order, called out, "Weel, lads, I am sorry I can gae nae farther wi' you, but deil hae my saul if ye sall want music;" and struck up a favourite warlike air, with the utmost unconcern for any thing but the unspeakable delight of sending his comrades to battle with the animating sound of the pibroch.

It is a popular tradition that the enemy anxiously level at the pipers, aware of the power of their music; and a story is related of one who, at the battle of Waterloo, received a shot in the bag before he had time to make a fair beginning, which so roused his Highland blood, that, dashing his pipes on the ground, he drew his broadsword, and wreaked his vengeance on his foes with the fury of a lion, until his career was stopped by death from numerous wounds. It is related of the piper major of the 92d, on the same occasion, that, placing himself on an eminence where the shot was flying like hail, regardless of his danger, he proudly sounded the battle air to animate his noble companions. On one occasion during the Peninsular war, the same regiment came suddenly on the French army, and the intimation of their approach was as suddenly given by the pipers bursting out their gathering. The effect was instantaneous; the enemy fled, and the Highlanders pursued.—*Mrs S. C. Hall's Chronicles of a School-Room.*

RELIGIOUS EDUCATION OF CHILDREN.

Do not press your children too much during their early years on the subject of religion. Show them, by your example, that it is the object of your own reverence; but suffer their religious principles to form gradually, as their understandings open. Do not make religion appear to them a burden; do not lay them under unnecessary restraints; do not let them see religion clothed in a dress repulsive to their youthful minds. To insure its making a good impression on them, let it be clothed in its native colours of attraction. Study to make them regard it as an object of veneration, but, at the same time, what it truly is, as a source of cheerfulness and joy. Do not let them regard the Sabbath as a day of gloom and restraint. Take them with you to the house of God, and accustom them to regard the institutions of religion with reverence, but do not compel them, during the rest of the day, to remain immured within the walls of your own house. Allow them the reasonable indulgence of air and exercise—an indulgence useful to their health, rational in itself, and no way inconsistent with their religious character; while the refusal of that indulgence has just the effect of making them regard the return of the day as a day of penance and mortification, instead of hailing it as a day of joy.

SCHOOLS IN INDIA.

In the schools which have been lately established in this part of the empire, of which there are at present nine established by the Church Missionary, and eleven by the Christian Knowledge Societies, some very unexpected facts have occurred. As all direct attempts to convert the children are disclaimed, the parents send them without scruple. But it is no less strange than true, that there is no objection made to the use of the Old and New Testaments as a class-book; that so long as the teachers do not urge them to eat what will make them lose their caste, or to be baptised, or to curse their country's gods, they readily consent to every thing else, and not only Mussulmans, but Brahmins, stand by with perfect coolness, and listen sometimes with apparent interest and pleasure, while the scholars by the road-side are reading the stories of the creation and of Jesus Christ. Whether the children themselves may imbibe Christianity by such means, or

whether they may suffer these truths to pass from their minds, as we allow the mythology which we learn at school to pass from ours, some further time is yet required to show; but this, at least, I understand, has been ascertained, that a more favourable opinion both of us and our religion has been apparently felt of late by many of those who have thus been acquainted with its leading truths, and that some have been heard to say, that they did not know till now that the English had "a caste or a shaster." You may imagine with what feelings I have entered the huts where these schools are held, on seeing a hundred poor little children seated on the ground writing their letters in sand, or their copies on banana-leaves, coming out one after another to read the history of the good Samaritan, or of Joseph, proud of showing their knowledge, and many of them able to give a very good account of their studies.—*Heber's India.*

MISS WILBERFORCE.

When Mr Wilberforce was chosen member for York, his daughter, in walking home from the scene of the election, was cheered by an immense crowd, who followed her to her own door, crying, "Miss Wilberforce for ever! Miss Wilberforce for ever!" The young lady turned as she was ascending the stair, and, motioning to the populace to be quiet, said, very emphatically, "Nay, gentlemen, if you please, not Miss Wilberforce for ever;" which sent them all home in good humour.

STORY OF CASSEM,

OR AVARICE PROPERLY REWARDED.

THERE dwelt at Bagdad an old merchant, named About Cassem, noted for his avarice. Although he was very rich, his clothes were nothing but patches and rags; his turban was of the coarsest cloth, and so dirty that it was difficult to distinguish the colour. But of his whole dress, his *papooshes* [slippers] were what merited most the attention of the curious; the soles were armed with large nails, and the upper leathers were an assemblage of botches; the famous ship Argo had not so many pieces in it; and ever since they had been *papooshes*, which was about ten years, the most skilful cobblers in all Bagdad had exhausted their ingenuity to keep them together. They were even become so heavy that they passed into a proverb; and when any one wanted to express a thing that was remarkably clumsy, Cassem's *papooshes* were always the object of comparison.

One day this merchant was walking in the *bazaar*, when an offer was made him of a large quantity of crystal, of which he made an advantageous purchase; and hearing some days after that a perfumer, whose affairs were in a ruinous state, had some excellent rose-water to sell, which was his last resource, he instantly took advantage of the poor man's misfortunes, and bought his rose-water for half the value. This new bargain put him into good humour; however, instead of giving an entertainment to his neighbours, according to the custom of the merchants of the East, when they have made a fortunate purchase, he found it more convenient to go to the public baths, where he had not been for a long time. As he was undressing, a person whom he took to be his friend, for the covetous rarely have any real ones, told him that his *papooshes* were the ridicule of the whole city, and that he ought to buy a new pair. "I have thought of it a long time," replied Cassem; "however, they are not yet so bad but they may serve a little longer." During this conversation he was quite undressed, and retired to the bath.

While he was bathing, the Kazee of Bagdad came likewise to bathe. Cassem, coming out before the judge, passed first into the dressing-room, and having put on his clothes, he sought in vain for his *papooshes*, in the room of which he discovered a new pair. Our avaricious merchant, persuaded, because he wished it so, that the person who had just rebuked him about his old slippers had made him a present of the new pair, put them on his feet without hesitation, and quitted the place, overjoyed at the thought of being saved the expense of buying.

When the Kazee had done bathing, the slaves looked about for their master's *papooshes*, instead of which they could only find a vile old pair, which were readily known to be Cassem's; the Kazee's officers went directly in search of the suspected thief, and finding him with the stolen effects upon him, after exchanging *papooshes*, the Kazee sent him to prison; and as he was reputed to be as rich as he was covetous, he was obliged to compromise the matter with the Kazee, by the payment of a considerable sum of money.

On his return home, the afflicted Cassem, for very spite, threw his slippers into the Tygris, which ran under his windows. Some days afterwards, a fisherman, pulling up his net, found it heavier than usual, which was owing to the weight of the *papooshes*, the nails of which had caught hold of his net, and broke several of the meshes. The poor fisherman, enraged at Cassem and his slippers, took it into his head to fling them in at the windows; and he threw them with such force that he overset the crystal vases which decorated the cornices and mantelpiece of the room, and one of them likewise struck the bottle containing the rose-water, and dashed it to pieces.

Figure to yourself, if you can, the agonies of Cassem, on beholding this scene of devastation. "Cursed *papooshes*!" exclaimed the covetous wretch, tearing

his beard, "you shall not do me any farther mischief." So saying, he took up a spade, repaired to his garden, and dug a hole to bury them. One of his neighbours, who for a considerable time had owed him an ill office, seeing him turning up the ground, ran to the governor and acquainted him that Cassem had just dug up a hidden treasure in his garden. This was sufficient to arouse the cupidity of the commandant, and our miser in vain remonstrated, assuring him that he had not discovered any gold, but was only burying his cursed slippers; the governor had made sure of money, and the unfortunate Cassem could not obtain his liberty without giving a handsome present.

The distracted old man gave his *papooshes* most heartily to the devil, and went and threw them into an aqueduct at a great distance from the city, imagining that he should hear no more of them; but the devil, who had not done playing his tricks with him, directed them to the conduit of the aqueduct, by which means they intercepted the current of the waters, and caused an inundation in the adjoining gardens. The owners, on discovering the cause, took the slippers to the Kazee, and demanded satisfaction for the damages they had occasioned. The unhappy master of them was once more committed to prison, and condemned to pay a fine which amounted to a larger sum than the two former ones together; after which, the Kazee, who would by no means detain his property, restored to him his choice *papooshes*.

Cassem, that he might be finally delivered from all farther harm from the slippers, now determined to burn them; but as they had imbibed a great deal of water, he set them on the terrace at the top of his house to dry by the sun. But fortune had not yet exhausted her quiver against the unlucky man, and she now dealt him a more cruel stroke than all the rest. A young dog in the next house, perceiving the slippers, leapt from his master's terrace over to Cassem's, seized one of them in his mouth, and played his gambols with it, till at last he let it fall over the parapet, and, unhappily, it alighted on the head of a woman with child, who was passing along the street before Cassem's door. Fear, added to the violence of the blow, made the poor woman miscarry. Her husband carried his complaint to the Kazee, and Cassem was condemned to make him a recompense proportioned to the injury he had done his wife.

Upon this fresh misfortune, our miser ran home, and, taking his *papooshes* in his hand, he once more repaired to the Kazee. "Behold! my lord," said he, with an impetuosity which diverted the judge, "the instruments of all my sufferings; these cursed *papooshes* have reduced me to poverty; deign, therefore, to publish a decree, that I may not be made responsible for the ills they will doubtless occasion hereafter." The Kazee could not refuse this reasonable petition; and Cassem at length, by dear-bought experience, learned the fatal effects of avarice.—*Noble's Orientalist.*

DIFFUSION OF INTELLIGENCE.

THE following are the observations of a foreigner (the late Baron de Staël) on the newspaper system of England:—"Of all means of publicity (says he in his letters) no one contributes more than the newspapers to that general diffusion of a moderate degree of knowledge, which may be mentioned as the distinguishing characteristic of England. In every country the periodical press is one of the most important results of modern civilisation, but nowhere is it so essential an element of the social organisation as with the English, and with the Americans, whose manners are perfectly similar to those of the English in this respect. Elsewhere, newspapers are a powerful weapon, of which governments and parties avail themselves by turns. In England and in the United States they are the agent and the indispensable medium of all the connexions men have with each other. There are few villages in England where the reading of a newspaper is not become a primary want; and in America, I am told, we even see servants making it one of the stipulations of their engagement.

The circle of readers is incomparably more extensive in England than with us. They reckon about a thousand circulating libraries, and more than three hundred book-clubs—an ingenious institution, which I think might be introduced into France with advantage. Newspapers have quadrupled in England within the last forty years. In 1782, their number was seventy-nine; and in 1821, according to a report made to the House of Commons, they were two hundred and eighty-four. None of these papers, except the Observer, which is published only once a-week, have so many subscribers as the Constitutionnel or the Journal des Debats, which are sold at a much lower price. The style of the papers sometimes savours of this. Having to gratify the taste of the very great number of readers they reckon upon in the lower classes of society, they are obliged to have recourse to phrases, the energetic familiarity of which occasionally degenerates into coarseness. 'When I took up the North Briton,' says the celebrated Wilkes, 'the paper was written by two persons, Churchill and Lloyd—one a wit, the other a poet. I soon saw that it could not go on thus. I laid aside their fine writing, and began to cry as loud as I could bawl, 'The Scotch! the Scotch! the Scotch!' Thus I turned out Lord Bute.' In fact, the great strength of the newspapers consists in the frequent repetition of simple images and arguments level to all capacities. This strength is immense in England.

The spirit of the French is perhaps better adapted than any other to newspaper writing, a species of literature that requires, most particularly, quickness of perception, lively repartee, clear and rapid recapitulation. Transient as have been the moments of liberty enjoyed by our journalists, and vicious as our present legislation is, very remarkable talents have already been displayed by this class of writers. I seldom open one of our periodical papers, without being struck with the elegance of style and sagacity of reasoning that are observable in a great number of articles; and I have seen this opinion shared by Englishmen, who, little acquainted with the progress France has made in this career, could not avoid showing some surprise, slightly tinged with disdain. But we are, nevertheless, pursuing a false system in respect to newspapers. We have introduced the division of labour, where it is not merely useless, but injurious. We separate political and literary journals from commercial, legal, and magisterial news, and from periodical collections relative to jurisprudence. But as few persons are able to subscribe for these different publications, though they all more or less directly concern the citizens at large, it follows that readers of each class remain ignorant of the subjects that are not within the immediate sphere of their business or tastes, and the publicity of each is only partial. The country manufacturer has no knowledge of any improvements made at Paris or in other parts of France, or it reaches him very tardily. The monied man in the metropolis is ignorant of the ways in which his capital might be advantageously employed in the country. The decrees of our twenty-six royal courts are secrets to all but those who frequent them; while a more extensive publicity would perhaps prevent a decree in opposition to one preceding it, or decision contrary to common sense; would prevent a counsellor from undertaking a cause, for which he would afterwards have to blush at the bar of public opinion.

The daily papers, the first object of which at present is to gratify the passions of their party, or amuse the idle, would acquire a more solid and useful character, when they became the depositaries of such a number of facts, and would be obliged to be cautious of assertions, to which these very facts would give the lie. An English newspaper is a kind of microcosm, in which all the circumstances that interest the community are displayed. We there see daily the debates in Parliament, the pleadings of counsellors, and decisions of the courts, faithfully reported; not merely, as with us, in a few cases that may excite curiosity, or serve the views of a party, but in all causes, civil or criminal. The charges of judges, and simple affairs of police, have the same publicity. Strongly as differences of opinion are pronounced in this country, violently as polemics are exercised, respect to facts is carried too far for a journalist to venture to falsify them. Never, or scarcely ever, does the same debate in Parliament, or the same cause in a court of justice, exhibit an aspect wholly different, when read in papers written by opposite parties. The first thought of the antagonists is to settle the lists with fidelity. Speeches at country meetings, and at assemblies of the people of every kind, whether religious, philanthropic, political, or commercial; those of the East India Company, of the Common Council of London, and of other corporate bodies of any consequence, are published in the newspapers. By these the government makes known the conditions of its contracts; the candidate for a seat in Parliament solicits the votes of electors, and thanks his supporters for their exertions; competitors of all kinds exhibit their claims, and solicit suffrages. The births, marriages, and deaths, of persons of any importance—their arrivals and departures, the company assembled at their houses, the least circumstances of their lives—are all known, all appear in print. The whole of Great Britain appears to be the house of glass of the ancient philosopher. Hence arise a boldness, a frankness, in all the reports, that are unknown to the Continent. The mind requires publicity, as the body does exercise in the open air; and every one is so accustomed to this system, that even men who are the most susceptible on the point of honour never think of taking offence at the jokes, of which an action or speech may be the subject in a newspaper."

EUROPEAN JOURNALS.

MR QUETELET, in his Statistical Researches respecting the kingdom of the Netherlands, gives the following statement:—"We might indeed take the number of journals which appear in a country, in some respects, as the measure of the ardour with which knowledge is circulated. Such a measure, if not strictly accurate, at least offers an interesting classification of the several governments:—

States.	One Journal for Inhabitants.
Spain,	890,000
Russia and Poland,	674,000
Sardinian States,	560,000
Papal Dominions,	431,670
Austrian Empire,	376,471
Portugal and Tuscany,	210,000
Switzerland,	66,000
France,	52,117
Sweden and Norway,	47,000
British Islands,	40,800
German Confederation,	44,000
Prussian Monarchy,	43,090
Netherlands,	40,953

It is seen by this statement that newspapers or

journals are more numerous in the Netherlands, in proportion to the population, than in any other state in Europe. In Spain they are least numerous. The difference would be still more striking if the extent of territory had been assumed as the basis of comparison. The writer does not seem to have calculated the amount of circulation of the respective journals, and which in some of the London and Parisian papers is enormous. Under this view, the British Islands may be said to possess by far the largest number of journals in proportion to the circulation, and that even under the payment of heavy duties."

JOSEPHUS.

MR TENNANT, author of "Anster Fair, a Poem," and not less distinguished for his erudition than by a rich and peculiar style of humour in poetry, gives the following account of the Jewish historian, in the Edinburgh Literary Journal:—

"Josephus, of all the Jews the most celebrated for his genius and learning, was the son of Matthias, an honourable citizen of Jerusalem, who was connected by descent both with the regal and priestly branches, and hence transmitted to his son a twofold honour, that was doubly dear in the eyes of his fellow-citizens. His son soon distinguished himself by his inclination for learning; and, what was remarkable in a Jew, he confined not himself to his own contracted sphere of Hebrew literature, but, boldly bursting through the prejudices that fettered his countrymen, he expatiated abroad into the more ample and diversified fields of Greek and Roman science. He made himself an eloquent master of the language of Athens, and became thereby enabled to defend and do justice to his country, and to celebrate, in the universal and harmonious language of Homer and Herodotus, the institutions, manners, and achievements of his sublime and extraordinary countrymen. He was not only an accomplished scholar, but an ingenious and accomplished general; he for a long time checked and baffled, by his talents, the victorious arms of Vespasian: and when at last necessity compelled him to philosophise on the advantages or the expediency of submission, he had already secured the esteem and admiration of his noble opponents, who knew virtue too well in themselves not to value it in at once an accomplished and undaunted enemy. Like the Grecian general Polybius, to whom his character and circumstances bear considerable resemblance, he, after fighting bravely against the conquerors of the world, and sharing at last the fate of a captive, was at once admitted into their friendship and most familiar confidence: and, at last, with his pen, commended that magnanimity and skill in arms which at once had extorted his admiration and compelled his submission. Happy had it been for his countrymen had they been influenced by his excellent counsels, as the Greeks were by those of the virtuous general of Megalopolis!

The works of Josephus are voluminous, and bear testimony to his diligent and persevering genius. His largest, though not his best work, is his *Archæology*, or *Jewish Antiquities*, in twenty books, wherein he deduces the history of Judea from the creation to the age of Nero, and which is chiefly valuable from its filling up the chasm that separates Old and New Testament History. His *Jewish War*, in seven books—his most eloquent work—details, along with some preliminary recapitulation, the terrible incidents of that singular war that commenced under Nero, and terminated in the extirpation of the Jews, and destruction of their capital by Vespasian and Titus.

It is only of the style of the Jewish historian that the writer of these remarks means here to speak, and not of the credibility of his statements as compared with the Bible, and as inducing or justifying against their author a charge of credulity or of incredulity. The style of Josephus in his *Archæology* is somewhat irregular and discrepant. His mind and his pen seem to vacillate between the redundancies of Grecian eloquence, which, being fashionable in his day, he rather affected, and the simplicity of Hebrew narration, as presented to us, unadorned and unaffected, by the historians of the Old Testament, to which his mind, as it necessarily resorted to them for information, had also a propensity to adhere, as a native, in laudable imitation. There is a perpetual conflict, as it were, between the concise simplicity of Judea and the splendid exaggeration of Greece; a heterogeneous mixture of the splendid with the simple in writing as in architecture, the intermixture of Palestine plainness with Grecian magnificence in the tombs of the valley of Jehosaphat. Accordingly, the naked narrative of Moses is in many places spoiled, as it passes through the hands of this historian, by unnecessary exuberance. The story of Joseph, so exquisitely impressive by its touching and forcible simplicity, where every word is, as it were, a weapon; the dedication of the temple by Solomon, one of the finest passages to be found in any writing, are vitiated and reduced in their effect by the cumbersome and spurious eloquence with which the sentiments are overloaded. It is in the history of times less ancient, and of transactions within the compass of his own experience, that his mind, making no reference to the simple annals of Judea, and left free and unfettered to its own scope of splendid illustration, manifests its peculiar power. In his *Archæology*, his account of the divisions that rent, tormented, and dispeopled the palaces of Herod; of the death of King Agrippa; in

his *Jewish War*, his description, most masterly in its kind, of the siege of Jotapata; of the attack in the streets of Gamala; of the entrance of the Idumeans by night, during a storm, into Jerusalem; of the naval battle on the sea of Genesareth; of the captures of the fort of Masada; of the bloody conflicts in and round about Jerusalem; of the triumphal entry into Rome of Vespasian—are not surpassed either by Livy or any other Greek or Latin historian. He is undoubtedly the most sublime of all historians; his genius being decidedly Jewish, and partaking largely of that fervency and soaring superiority which characterise the writings of his extraordinary countrymen. Perhaps he is too sublime for history; his narrative flows along in epic pomp and dignity, broken sometimes into bursts of tragic vehemence: it is like the long and richly-flowing river of gold and silver, to which he himself likens the triumphal entry of Vespasian. As his narrative part is thus splendid, the argumentative portion, consisting of his orations, is, in a corresponding degree, eloquent; more discursive, perhaps, but not displaying less ratiocinative invention than the speeches of Livy. Indeed, of the Greek or Roman historians, Livy is the only one that may pretend to rival him in vivacity or splendour; and if the Roman historian at all exceeds him, it is in the compression, the condensed force and invigorated majesty, of the language, rather than in the brightness and magnificent flow of the images. Of modern historians, or of modern writers, there is only one great living name that can aspire to an equality with him, or with the historian of Rome, in vivid expansion of imagery, all-illuminating splendour, and graphic energy of language.

As connected with the Old and New Testaments, and as throwing light on the incidents, characters, manners, and localities noted in Scripture record, the works of Josephus cannot be too much valued by a Bible student. They are by far the best commentary and expositor one can use in reading the Old and New Testaments."

THE LAIRDS OF INNES.

FOR a long period the family of Innes was one of the most respectable in the county of Moray, as may be gathered from the various ancient records relative to it, which are still extant in the country. The venerable building, with the surrounding lands, which still retain the name of Innes, situated about five miles from Elgin, in a north-east direction, was, some centuries ago, the seat of the representative of the illustrious family in question. We propose to lay before our readers some circumstances of a romantic but perfectly authentic character, regarding the death of one of the Lairds of Innes, towards the close of the sixteenth century.

Lord John Innes, the representative of the family of that name in the year 1579, having had no children, settled about this time his titles and estate upon his heir-at-law, Alexander Innes of Cromy, his own cousin, granting him, at the same time, permission to enjoy both, even in his own lifetime. Robert Innes of Innermarky, of whom a sculptured representation in stone has recently been discovered among the ruins of Elgin Cathedral, was one of the cadets of the same family, and felt immeasurably chagrined at the conduct of Lord John, in thus voluntarily depriving himself of the honours and influence to which in virtue of his birth he was legitimately entitled. He had at the same time an anxious eye to the title and estate of Innes himself—although, of course, he was careful to conceal, as much as possible, from Lord John and his other friends, the ambitious aspirations by which he was actuated. Either through threats or otherwise, Innermarky so effectually wrought on the fears of Lord John, who by this time was considerably advanced in life, as to make him so far repent of his consigning over his honours and estate to his cousin Alexander, that he entered into a conspiracy with Innermarky to assassinate the former.

The only thing wanting was an opportunity of carrying their murderous purpose into execution, and such an opportunity was not wanted long. Alexander about this time (April 1580) had gone to Aberdeen for the purpose of seeing his only son, a youth of sixteen, at this time a student in one of the colleges of that city. During Alexander's visit to his son, the latter became seriously indisposed; and his father's stay was consequently prolonged until he should witness the issue of his son's indisposition. The two conspirators, mustering a goodly number of their attendants, proceeded to Aberdeen, where they arrived at midnight, and immediately proceeded to execute their purpose.

They found the gate of the close in which their intended victim resided at the time, lying quite open; but the doors of the house were closely shut. To have broken open the doors by any violent means, would most probably have created an alarm in the neighbourhood, and thus entirely defeated the objects the conspirators had in view. It occurred to them, therefore, that the most likely method of succeeding in their murderous project would be to create a pretended dispute among their attendants, by which means the inmates of the house would probably open the doors, with the view of ascertaining its cause, and witnessing its consequences. One of them accordingly set up a loud cry of "Help a Gordon! help a Gordon!"—the gathering word of those of that name, which, as Alexander Innes was warmly attached to the interests of the Gordon family, they knew would be the most likely

means of inducing him to come out from his bed. The stratagem was completely successful; Alexander instantly jumped out of bed—laid hold of his sword—came to the outside—and inquired into the cause of the dispute. Although the night was dark, Innermarky knew him perfectly by his voice, and, presenting his gun, shot him through the body in a moment. A crowd of the conspirators' attendants then rushed on their victim, and plunged their daggers into every part of his person. Lord John Innes, however, as if either shocked at the brutality he witnessed, or repenting of his being at all engaged in so horrible a business, stood trembling at a little distance from the spot on which the revolting murder was committed. Innermarky, on perceiving that Lord John thus stood aloof from the atrocities he was witnessing, ran up to him with a terrific expression of countenance, and holding to his throat the dagger which was still reeking with the blood of his victim, protested, that he should in a moment plunge it into the bosom of Lord John, if he did not immediately follow the example he and his attendants had set him in stabbing his dagger to the hilt into the body of his victim. Lord John, aware that death would be the certain consequence of any attempt at resistance, reluctantly followed the example of the others, and plunged a dagger into the body of his nearest relation, and the most courageous individual who bore his name. Every other person present who had not already done so, was also compelled to follow the example they had seen: and so anxious was Innermarky to involve as many as possible in the affair, in order that in the eye of the law all might appear equally guilty, that he actually compelled Mr John Innes, afterwards of Coxtown, then a youth at school, to rise from his bed and also plunge a dagger up to the hilt, into the body of his dead relation.

The next object to which the conspirators turned their attention, was to seize the person of their victim's son, Robert Innes, who was then sick, with a view to his sharing the same fate as his father. On hearing, however, the cries of murder which his expiring parent uttered while the conspirators were stabbing him, the young man, seriously indisposed as he was, scrambled out of his bed, and by the help of a friend, escaped out a back door into a garden, whence he was taken into the house of an acquaintance, unknown to those who were meditating his life.

Innermarky then took off the signet-ring from the finger of his murdered relation, and having bribed the servant of the deceased to assist in the execution of his purposes, he dispatched him with it to Innes House, instructing him to present it to the wife of his deceased master as from her husband; and at the same time to request, as if by his orders, the box containing the papers relative to his title and estates, under the pretence that Lord John, who was represented as being at the time with her husband at Aberdeen, was desirous of making some important alterations which would render them more valid in the eye of the law than they then were. And in order still more effectually to prevent her from having any suspicions on the subject, Innermarky sent the bribed servant on her husband's own horse, instructing him to add, that the reason why he had sent his ring and his own horse, was, that he had not at the time an opportunity of writing her, and that he thought the appearance of these, together with his own servant, would be sufficient to convince her that all was right.

The lady of the deceased was somewhat uneasy at receiving such a message from her husband on a subject of so great importance; but seeing the ring which he daily wore—the horse on which he daily rode—and the servant who was daily in attendance on him—she could not doubt that he had actually desired the box and papers to be sent to him, and accordingly delivered them to the servant, and allowed him to depart from the mansion.

At this time there resided at Innes House a young man, an intimate acquaintance of Lady Innes's son, then lying indisposed in Aberdeen; and hearing of the servant's being about to return to that city, and feeling at the same time a strong anxiety to see his sick acquaintance, he asked permission of the servant to accompany him to the place in which he lay. The servant refused compliance with the young man's request, on various grounds. The latter, however, was determined to go by force if not by permission; and with this view, when the servant was setting out on his journey, he jumped up behind him on the horse's back. The servant insisted that the youth should dismount, while the latter was equally determined that he should not. A scuffle ensued between the contending parties, and soon assumed so serious an aspect, that the servant drew a dagger he carried with him, and aimed a deadly thrust at his youthful opponent; but the latter, by a masterly and courageous manœuvre, wrenched it from him, and with one deadly thrust plunged it into his bosom. The servant fell from his horse, and expired almost immediately. The young man then returned to Innes House with the box, papers, &c.

Lady Innes felt the utmost regret at the fatal scuffle which had taken place between the servant and the young man in question; and while in the act of giving full vent in copious tears to the melancholy emotions which the event had produced in her mind, another of her husband's servants arrived from Aberdeen, bringing the still more mournful intelligence of his murder by the hands of his own nearest relatives.

When the confusion and sorrow consequent on the melancholy intelligence of her husband's death had somewhat subsided, Lady Innes secured all his papers, and fled for protection to her friends, who immediately conducted her to the king, before whom she detailed all the circumstances connected with the painful affair.

The Earl of Huntly, who was related by blood to the family of Innes, on hearing of the murder of Alexander Innes, hastened to Aberdeen for the protection of his sick son, whom he carried to Edinburgh, and for greater safety placed him under the guardianship of Lord Elphinstone, then Lord High Treasurer of the kingdom.

Lord John Innes and Innermarky, some days after the commission of the murder, returned so far as to Lord Saltoun's house, then situated in the parish of Rothiemay; from which, after procuring a new supply of horses, they proceeded to Innes House, and re-invested Lord John in the titles and estate.

For two years afterwards, both these men kept possession between them of the estate of Innes, but at the end of that time they were declared outlaws; and the son of him they had so barbarously murdered came north from Edinburgh, with a commission against them, and all others who had been accessory to his father's death. This young man had a few months previously been married to the Lord Treasurer's daughter, and in consequence of his connection with so influential a personage, the party he came with was so numerous and well provided with the implements of war, that they soon laid waste the possessions, and slew a great many of those who espoused the cause of their opponents. Lord John, however, fled to the south, and endeavoured to conceal himself there, but was discovered, apprehended, and sent back to Innes House, by the friends of the Lord Treasurer. The young laird, however, did not make his head the price of his conduct, as might under all the circumstances of the case have been expected, but contented himself with making him exhibit his name to various written papers, which incapacitated him from any future mischief in regard to his property.

Innermarky fled to the hills, where he continued to elude all the search which was made for him; but being soon wearied of the lonesome and unhappy life he led there, he ventured into the house of Edinglassy, where, in September 1584, he was surprised by the young laird of Innes and a party of adherents, who instantly killed him, and afterwards cut off his head and gave it to Lady Innes, the widow of him whom he had murdered in Aberdeen a few years before. Lady Innes was so joyrived at the possession of the head of the murderer of her husband, that she made a journey to Edinburgh, carrying it all the way herself for the express purpose of laying it at the feet of the king.—*Elgin Literary Magazine, August 1820.*

COLQUHOUN GRANT,

A JACOBITE ANECDOTE.

COLQUHOUN GRANT, who, when a young man, had signalled himself in the service of Prince Charles, afterwards settled down into the cool and decorous life of a writer. As one of the numerous and respectable class of Writers to the Signet, he is said to have exerted the pen to as good effect as he had formerly played the sword; and in advanced age, he was noted as a man who both knew how to acquire money, and how to preserve it when it was acquired. There is something melancholy, and not altogether agreeable, in the idea, that the same mind which had been filled with chivalrous fervour in the company of 1745, should have been afterwards devoted to the composition of law papers, and the acquisition of filthy lucre. Yet, that he never became altogether insensible to the enthusiasm which excited his youth, seems to be proved by the following anecdote.

Mr Ross of Pitcalnie, representative of the ancient and noble family of Ross, had, like Colquhoun Grant, been out in the Forty-five, and consequently lived in terms of the runnicks and respectable class of Writers to the Signet, he is said to have exerted the pen to as good effect as he had formerly played the sword; and in advanced age, he was noted as a man who both knew how to acquire money, and how to preserve it when it was acquired. There is something melancholy, and not altogether agreeable, in the idea, that the same mind which had been filled with chivalrous fervour in the company of 1745, should have been afterwards devoted to the composition of law papers, and the acquisition of filthy lucre. Yet, that he never became altogether insensible to the enthusiasm which excited his youth, seems to be proved by the following anecdote.

adding, with an expressive wink, "This forty's made out o' the battle of Preston; but stay a wee, lads; I've f'arkir' my pouch yet—by my faith, I wadna gie it for aucky!"—*Scottish Jests and Anecdotes*

MUSICAL BEANS.

Mr Nicholson of Carnock, a genuine Scottish laird of the old school, like many greater men, was frequently known to confer a favour from no better or higher feeling than that excited by a witty, or caustic, or caustic, reply. This weak side of his was well known, and signally improved upon by his equally apt friend. Be it understood, that the aforesaid worthy flung himself on being a capital player on that melodious instrument the bagpipe. One of his tenants, who was much in arrears for rent, had a most unseasonable visit from the laird, demanding immediate payment. Cuning Saunders knew well that his landlord was generally as "Atweel, your honour," says he, "I canna pay you just noo, for I haena the siller." "Why, Saunders," quo' the laird, "I must also that it is in ordinar accounted a very sufficient reason for aye no paying his just and lawful debts; but it's weel kent through the hail countrie side that you have had a grand crop this year, and plenty o' siller you maun ha—thats past ae hair o' doot." "The guide Lord forgie your honour," says Saunders, "what ca' ye a grand crop? I'm sure you heard tell of my field o' beans, that I lookit for sae muckle siller frae, for nae other purpose, guide kens, but to put into your honour's pouch, an' hoo did they turn out? Oeh! sirs, sirs, my heart's like to break when I think o't!" "Deil tak ye!" quo' the laird, "I aye thoct that your very beans were the best part o' your crop." "The best part!" most dolefully ejaculated Saunders: "why, sir, gi' lka bean-stalk had been a piper, he wadna ha'e heard his neighbour play!" It is almost needless to add, that Saunders got his own time to pay.—*Lit. Gaz.*

BLADE FORGING.

The shop in which the blade of a cutting instrument is formed from the bar steel by hammering, is locally termed a *smithy*, and contains on one side a hearth with bellows, a *stithy* or anvil inserted in a large block of wood or stone according to circumstances, water-trough for the purpose of hardening heavy steel-faced hammers, iron tongs, and some other implements of iron and steel. In fabricating the smaller articles, the individual who hammers the steel into the form of a knife blade, for instance, generally employs a boy to manage two or three bars in the fire, and hand them, when sufficiently heated, in succession to the hammerman, who, by thus alternately receiving the heated and returning the used rod, is kept constantly at work. The uniformity of exertion which is secured by this arrangement, and at the same time the dexterity with which, with very simple instruments, a material, seemingly the most intractable in nature, is moulded on the anvil, would astonish a stranger. Indeed, long habit and constant practice can alone enable a workman to transform rods of steel into neat blades with the requisite degree of precision and dispatch.—*Lardner's Cyclopædia.*

CANADIAN MINERALOGY.

Canada, says Macgregor, is considered rich in minerals. Iron of the best quality has been found in great abundance. Silver has been picked up in small quantities of lead, tin, and copper, have been discovered in several places. We are, however, still ignorant of the mineral riches, and even of the geology of these regions. The researches of the Montreal Natural History Society lead us to expect important discoveries. The following extract from the Canadian Review enumerates most of the minerals that have been discovered—"The mineralogy of the Canadian has hitherto been almost altogether neglected. But the imperfect researches which have been made prove it to be rich in the rarer kinds of minerals, and not deficient in those applicable to economical purposes. Peltalite, one of the rarest substances in the world, and remarkable for containing the newly discovered fourth alkali, lithia, was sent from York, in Upper Canada, in 1820, by Dr Lyon, surgeon to the forces. Berks is a Lake of Woods—Labrador felspar (Lake Huron)—axinite (Hawkesbury Ottawa)—and the very rare autophyllite (Port Wellington). Marbles and serpentine are quite common. Plumbago, ores of antimony, lead, iron, and copper, are frequently met with. The northern and western shores of Lake Ontario abound in salt springs, some of which (Stony Creek and St Catherine's) are very productive, even with the employment of small quantities. The north shore of Lake Erie exhibits immense beds of gypsum, the principal of which is in Dumfries, and quarried largely for the purpose of agriculture."

THE SHORT GENTLEMAN'S APOLOGY.*

Sublimest, fairest of thy sex, how can I match with thee,
When I'm but a poor fellow, and a half an inch in thee?
The time is really past, my dear, of which old writings tell,
When the little angels deep in love with giants fell.

I'm flattered much, I vow and swear, and may my oath be booked,
In not being by so tall a dame entirely overlooked;
Yet what may be a pleasant thing to me, meaningless flirtation,
Might prove, in wedlock's graver time, a pretty smart vexation.

First, now, suppose that courtship had commenced betwixt us two,
How strange a thing, if every time when I came here to woo,
I had to bring a telescope of Herschel's greatest size,
To pitch at you, that I might read the language of your eyes!

And if at last, some summer night, you were to blush consent,
And I was almost overpowered with love's soft ravishment,
You'd own 'twould be, upon the whole, an awkward sort of bliss,
Had a ladder to be ordered in ere I could reach a kiss.

These things, 'tis true, might be got o'er, being only *entre nous*,
But how, my dear, in heaven's name, d'ye think we e'er should do,
When we are going, man and wife, on friends and foes to call,
Already christened by some wag, "The Cannon and the Ball?"

'Twould break my heart, I'm very sure, though a stoutish heart it be,
If, while I walked on Prince's Street, hard trotting by your knee,
Some purblind dame were to cry out, "O La, Mrs So-and-so,"
This lady—sure, her reticule, she hangs it rather low."

I really am afraid, my dear, I should look something queer,
Hing from your gaily arm, like gaily hangings from Ethiope's ear—
Why, as ye fashions lead some foolish folk might be so hint
At having patterns copied from your "elbow ornament."

Their endless jokes, I see them all, by Jove, drawn out before me.
As clear and dreadful as the kings that made Macbeth so stormy—
First some one in contrasting us, would give me credit due,
But say that, on the whole, I fell a good deal short of you.

Another would remark that you must jealousy defy,
Seeing you kept your little man so much beneath your eye:
A third would wonder how at all I ever met your eyes,
Which ever go, like Milton's thoughts, "commencing with the skies."

No, no, my dear, it will not do, we can't be man and wife—
"Unequal yokes," St Paul has said, bring misery and strife—
Odds life, d'ye think I'd wed with one, who, spite of previous speeches,
Would be, however ill they'd fit, so sure to wear the breeches!

* This poem, here printed for the first time, was written, some years ago, after reading a similar drollery by Mr H. G. Bell, in his Literary Journal, entitled *The Tall Gentleman's Apology.*

COLUMN FOR HOME.

IMPORTANCE OF DOMESTIC AFFECTION.

I AM extremely desirous to impress my readers, especially the young ones, with the great value of *domestic affectionate feelings*, as the source of much that is excellent both in private and public life. I am led to the subject by a perusal of the published correspondence of the late amiable Dr Currie of Liverpool, who, it will be remembered, was the first biographer of our renowned countryman, the poet Burns. Dr Currie, who was a Scotchman, had been long settled as an eminent physician in Liverpool; but he still retained all his original regard for his own country, and the kindest recollections of the fireside where he had been reared.

"In my father's home (he writes) we had very good society: after a pretty extensive acquaintance with the world, I scarcely found any domestic circle better calculated to cultivate the affections, and not many where the powers of the understanding had fairer play." He always acknowledged, with unbounded gratitude, his especial obligation to an excellent specimen of a MAIDEN AUNT. "Those lay-sisters of charity (as is well remarked in the Edinburgh Review of those letters) are the comfort and salvation of so many families, that every home appears to be imperfect which has not the good fortune to have one of them appended to it." Among the letters is one from him to that same worthy lady, written by the doctor, then become a man. "I do not know (says he) any one that flatters me more agreeably than my good and kind aunt. I can declare to her with great truth, that I am very sensible of her praise, and much gratified by an expression of her approbation. We are now very old acquaintances. We have seen many changes and participated in many sorrows; and I hope the mutual sympathy and affection between us will continue, while we are sensible of pleasure or sorrow.

My obligations to you are now nearly of thirty-four years' standing, and though they are not all fresh on my memory, yet many of them are; and instances of your kindness mingle themselves with the earliest impressions that remain on my mind. I can remember that you gave me a halfpenny to put in my first breeches pocket I ever had. I can remember, too, that once when we were walking from Gretna together, and a shower of rain came on, you took off your own scarlet cardinal, and put it round me, leaving yourself exposed. Truth to say, I neither understood the kindness nor received it as I ought. We had to come past Kirkpatrick school, and the boys were playing on the green, never minding the rain; and as we came by, they cried out, *Eh! look at the little manny's red cardinal*. Oh, I was sadly mortified, and hard I struggled to get clear of the encumbrance; but as I could not do that, I jumped into the burn as we crossed it, out of mere spite. It was many years before I saw this business in its proper light. Well, I hope you will not deny any of this—if you do, I will send you twenty times more of the same kind."

Dr Currie had a near relation who had settled in America. They had been "schoolboy companions," and the doctor wrote to him thus:—"About 18 months ago, I visited your father and mother, both, as our phrase is, rather frail, but preserving nearly the same appearance, and displaying the same kind hospitality as formerly. I was entertained in the far room, where we used to sleep, and sat on the very same bed that held us together six-and-twenty years ago. The ideas were recalled to my mind, as fresh as if they had related to what happened yesterday: and I could not but suppose that I saw you lying under the clothes with your head bare, and a Jew's harp in your mouth, playing your favourite air. I talked with your mother about your old tricks, and drank drams with your father, so that we felt a-kissing each other, and we could have cried heartily. I looked into Mean water to see if there were any minnows, and there they lay under the banks, just as when we left them."

What a kind heart is shown by those delightful sketches, which, in another art, would indeed have been worthy of the pencil of a Wilkie! It was impossible but such a heart must have had a warm love of its native country. In my concluding quotations from those letters, accordingly, it will be seen that that love was with the writer of them a predominant passion.

Writing from Liverpool, where it will be remembered the doctor had been long sojourning, he says, "For my part, I assure you I love Scotland dearly—I like her green vales, her clear streams, her bleak mountains: As I travel north, I always watch the moment, and mark the spot (a little beyond Penrith) where Burnswark rises above the English horizon, and, presenting itself the first object in Scotland, recalls at the same time the idea of my native country, and of the scenes of my early life. 'Considering that I have lived but little in Scotland, and that I left it early, there is no man retains more of the partialities of a Scotsman than I do. Men whose connections in infancy deserved and possessed a large portion of their affection, always, I observe, love their country.'"

THE WAR OF INDEPENDENCE IN HOLLAND.

The struggle maintained by the inhabitants of the Low Countries, against the tyrannous government of Spain in the sixteenth century, presents us with one of the most noble and instructive instances of national resistance to unjust oppression recorded in the history of Europe. The unfortunate connection by which the Spanish sovereigns acquired a power over Flanders and other provinces, need not be traced; it is sufficient to state, that its results were most fully developed in the reign of Philip II., son of Charles V., in the decade of 1560-70. This unprincipled and indolent prince conspired to ruin the liberty and trade of the Netherlands, and to coerce them, by the establishment of the Inquisition under its most hated form, to renounce the reformed religion which they had embraced. The measures adopted by the unhappy Dutch and Flemings to stem the tide of Spanish aggression; their voluntary abandonment of their country, and their flight to England—a country in every age sacred as a refuge to the injured of all nations; their sufferings in person and property; the destruction of their towns; the loss of their commerce; the utter desolation of the rich and fertile territory from the Rhine to the Zuyder Zee; and the disruption of almost all social ties—form altogether such a picture of concentrated horrors as has rarely fallen to the lot of any historian to delineate. A History of the Netherlands, presenting a succinct and candid view of these and many other events, has been judiciously written by Thomas Colley Grattan, and published as a volume in Dr Lardner's Cyclopædia; and from this accessible source I shall draw a few facts illustrative of the proceedings of Philip, and his delegated instrument, the Duke of Alva.

"On the 5th of May 1567, this celebrated captain (the Duke of Alva), whose reputation was so quickly destined to sink into the notoriety of an executioner, began his memorable march, and, on the 22d of August, with his veteran army, consisting of about 15,000 men, arrived at the walls of Brussels. The discipline observed in this march was a terrible forewarning to the people of the Netherlands of the influence of the general and the obedience of the troops. They had little chance of resistance against such soldiers so commanded. Alva first turned his attention to the seizure of those patriot lords whose pertinacious infatuation left them within his reach. The next measures of the new governor were the re-establishment of the Inquisition, the promulgation of the decrees of the council of Trent, the revocation of the Duchesse of Parma's edicts, and the royal refusal to recognise the terms of her treaties with the Protestants. He immediately established a special tribunal, composed of twelve members, with full powers to inquire into and pronounce judgment on every circumstance connected with the late troubles. He named himself president of this Council, and appointed a Spaniard, named Vargas, as vice-president, a wretch of the most diabolical cruelty. This Council, immortalised by its infamy, was named by the duke the Council of Troubles. By the people it was soon designated the Council of Blood. In its atrocious proceedings no respect was paid to titles, contracts, or privileges, however sacred. Its judgments were without appeal. Every subject of the state was amenable to its summons; clergy and laity, the first individuals of the country, as well as the most wretched outcasts of society. Its decrees were passed with disgusting rapidity and contempt of form. Contumacy was punished with exile and confiscation. Those who, strong in innocence, dared to have a trial, were lost without resource. The accused were forced to its bar without previous warning. Many a wealthy citizen was dragged to trial, four leagues' distance, tied to a horse's tail. The number of victims was appalling. On one occasion the town of Valenciennes alone saw fifty-five of its citizens fall by the hands of the executioner. Hanging, beheading, quartering, and burning, were the every-day spectacles. The enormous confiscations only added to the thirst for gold and blood by which Alva and his satellites were parched. History offers no example of parallel horrors; for, while party vengeance on other occasions has led to scenes of fury and terror, they arose, in this instance, from the vilest cupidity and cold-blooded cruelty. After three months of such atrocity, Alva, fatigued rather than satiated with butchery, resigned his hateful functions wholly into the hands of Vargas, who was chiefly aided by the members Delirio and Della Torre. Even at this remote period we cannot repress the indignation excited by the mention of those monsters, and it is impossible not to feel satisfaction in fixing upon their names the brand of historic execration. One of these wretches, called Hesselts, used, at length, to sleep during the mock-trials of the already doomed victims; and as often as he was roused by his colleagues, he used to cry out mechanically 'To the gibbet!' so familiar was his tongue with the sounds of condemnation.

In addition to the horrors acted by the Council of Blood, Alva committed many deeds of collateral but

minor tyranny: among others he issued a decree forbidding, under severe penalties, any inhabitant of the country to marry without his express permission. His furious edicts against emigration were attempted to be enforced in vain. Elizabeth of England opened all the ports of her kingdom to the Flemish refugees, who carried with them those abundant stores of manufacturing knowledge which she wisely knew to be the elements of national wealth.

These judicial murders excited in the Netherlands an agitation without bounds. It was no longer hatred or aversion that filled men's minds, but fury and despair. The out-bursting of a general revolt was hourly watched for. The foreign powers, without exception, expressed their disapproval of these executions. The Emperor Maximilian II., and all the Catholic princes, condemned them. The princes of the Protestant states held no terms in the expression of their disgust and resentment; and every thing seemed now ripe, both at home and abroad, to favour the enterprise on which the Prince of Orange was determined to risk his fortune and life. The enterprise of the Prince, however, failed, and Alva's insolence continued unbounded. The following year was ushered in by a demand of unwonted and extravagant rapacity, the establishment of two taxes on property, personal and real, to the amount of the hundredth penny on each kind; and at every transfer of sale, ten per cent. on personal, and five per cent. for real property. It is here worthy of remark, that all the horrors of which the people of Flanders were the victims, and, in their full proportion, had not the effect of exciting them to revolt; but they rose up with fury against the payment of the new taxes. They sacrificed every thing sooner than pay these unjust exactions. The next important event in these wars was the siege of Haerlem, before which place the Spaniards were arrested in their progress for seven months, and which they at length succeeded in taking, with a loss of 10,000 men. Holland was now from one end to the other the theatre of the most shocking events. While the people performed deeds of the greatest heroism, the perfidy and cruelty of the Spaniards had no bounds. The patriots saw more danger in submission than resistance; each town, which was in succession subdued, endured the last extremities of suffering before it yielded, and victory was frequently the consequence of despair.

At length Alva was recalled, and he was succeeded by Requesens, a moderate and honest man, who was soon overwhelmed with the difficulties of his situation. The Spanish monarchy now came down in its pretensions, and the celebrated *Pacification of Ghent* was published on the 8th of November 1576. Still the country continued subject to Spain, new governors were appointed, and in less than ten years the provinces were again in a state of open resistance, which continued till they secured their independence. One of the most remarkable events during these troubles was the siege of Antwerp, by the Prince of Parma, in 1585.

The Prince of Parma had 80,000 men at his command. With such means of carrying on his conquests, he sat down regularly before Antwerp, and commenced the operations of one of the most celebrated among the many memorable sieges of those times. He completely surrounded the city with troops; placing a large portion of his army on the left bank of the Scheldt, the other on the right. To secure the navigation of the river, on which the success of the siege depended, he had to throw a bridge across the stream. Neither its great rapidity, nor its immense width, nor the want of wood and workmen, could deter him from this vast undertaking. He and his engineer first caused two strong forts to be erected at opposite sides of the river; and adding to their resources by every possible means, they threw forward a pier on each side of, and far into, the stream. The stakes, driven firmly into the bed of the river, and cemented with masses of earth and stones, were at a proper height covered with planks, and defended by parapets. These estacades, as they were called, reduced the river to half its original breadth; and the cannon with which they were mounted rendered the passage extremely dangerous to hostile vessels. But to fill up this strait, a considerable number of boats were fastened together by chain-hooks and anchors; and being manned and armed with cannon, they were moored in the interval between the estacades. The works of the bridge, which was 2400 feet in length, were constructed with such strength and solidity, that they braved the winds, the flood, and the ice of the whole winter.

The people of Antwerp at first laughed to scorn the whole of these stupendous preparations; but when they found that the bridge resisted the natural elements, by which they doubted not it would have been destroyed, they began to tremble in the anticipation of famine. Ninety-seven pieces of cannon now defended the bridge; besides which, thirty large barges at each side of the river guarded its extremities; and forty ships of war formed a fleet of protection, constantly ready to meet any attack of the besieged. They, seeing the Scheldt thus really closed up, and all communication with Zealand impossible, felt their whole safety depended on the destruction of the bridge. An Italian engineer named Giombelli was at this time in Antwerp, and by his talents had long protracted the defence. He has the chief merit of being the inventor of those terrible fire-ships, which gained the title of 'infernal machines;' and with some of those formidable instruments, and the Zealand fleet,

the long-projected attack was at length made. Early on the evening of the 4th of April, the Prince of Parma and his army were amazed by the spectacle of three huge masses of flame floating down the river, accompanied by numerous lesser appearances of a similar nature, and bearing directly against the prodigious barrier which had cost months of labour to him and his troops, and immense sums of money to the state. The whole surface of the Scheldt presented one sheet of fire; the country all round was as visible as at noon; the flags, the arms of the soldiers, and every object on the bridge, in the fleet, or the forts, stood out clearly to view; and the pitchy darkness of the sky gave increased effect to the marked distinctness of all. Astonishment was soon succeeded by consternation, when one of the three machines burst with a terrific noise before they reached their intended mark, but time enough to offer a sample of their nature. The Prince of Parma, with numerous officers and soldiers, rushed to the bridge, to witness the effect of this explosion—and just then a second and still larger fire-ship, having burst through the flying bridge of boats, struck against one of the estacades. The Prince, unmindful of danger, used every exertion of his authority to clear away the monstrous machine, which threatened destruction to all within its reach. Happily for him, an ensign who was near, forgetting, in his general's peril, all rules of discipline and forms of ceremony, actually forced him from the estacade. He had not put his foot on the river bank when the machine blew up. The effects were such as really baffle description. The bridge was burst through; the estacade was shattered almost to atoms, and, with all that it supported—men, cannon, and the huge machinery employed in the various works—dispersed in the air. The cruel Marquis of Roubaix, many other officers, and 800 soldiers, perished, in all varieties of deaths, by flood, or flame, or the horrid wounds from the missiles with which the terrible machine was overcharged. Fragments of bodies and limbs were flung far and wide; and many gallant soldiers were destroyed, without a vestige of the human form being left to prove that they had ever existed. The river, forced from its bed at either side, rushed into the forts, and drowned numbers of their garrisons; while the ground far beyond shook as in earthquake. The Prince soon recovered, and by his presence of mind, humanity, and resolution, he endeavoured, with incredible quickness, to repair the mischief. He speedily raised the confidence of his army as high as ever, and, by his manoeuvres, forced the city to capitulate after a siege of fourteen months.

LIFE IN CANADA.

"You are quite a townsman, my dear fellow; so it is needless for me to bore you about lakes, snows, serpents, &c. The inhabitants are tolerably civil. In a common tavern, your food and bed will ease your pocket of a dollar a-day; if in an hotel, half as much more, exclusive of wines, which are so so—no great shakes, a dollar a-bottle—and grogs in proportion. The fashionable young fellows follow a good deal the manners of the Americans—drink gin sling, sangorees, and lemonade; smoke cigars, and in the morning take bitters, cocktail, and soda water. The theatres are not open very often, unless some of your stars get erratic, and come over the water. They have their parties and their scandal through all the towns, the same as at home. You are well off, who are not bothered with these things in London; it is the only place in Britain where pride and presumption dare never show themselves, and where scandal can never thrive. The ladies dress very well, and seem to have a considerable quantity of conceit; their dresses here are not so plain and so elegant as with you; they have too great a profusion of flounces, feathers, and ruffles; few of them are to be met with very good-looking; the climate robs their complexions of all the beautiful colours, leaving behind the sallow, dun, and yellow; no pure red and white in Canada, and dimples and smiles are rare. I endeavoured to fall in love once or twice, and flung my old heart quite open to the little archer; but the frost, or something or other, would not allow the arrows to penetrate. I have met with girls from my own old Scotland that I liked to spend the day with very much, but they had no pretensions to beauty; we could talk of witches, and quote Burns together. But this love proceeds from many causes, which have but small connection with beauty of person; it is to be traced to the affinity of mind—Humph!

Do not let yourself be any longer deceived with the tale that there are no unmarried ladies here, for they are in the greatest abundance; and also more bachelors than I like to live among, having boarded in a house for a few days where there were above thirty bachelors, between twenty and forty years of age, every day at dinner. What do you think of this? Canada is not a place for people to get married in. What is the cause, it is not easy to assign: methinks it proceeds from the bachelors being chiefly foreigners—people badgered up and down this world, who forget that there is such a state as matrimony. Those who are long without a home get careless about finding one. The natives, however, and settled residents, wed as becomes them; and at their weddings they have what are called *spireverees*, a parading kind of show, with sleighs, if in winter, or a two-wheeled kind of gig, if in summer. Round the town they fly—What a set-out!—fiddles playing, pistols firing—altogether composing lots of fun; a true Canadian *spruce* is worth the

looking at. In Montreal, the snow accumulates to a great depth in the streets during winter, rendering the walking very precarious; people wear a kind of cramp on their feet, called a creeper, and the ladies move about with stockings drawn over their boots. The Scotch brogue here is not only conceived vulgar, but highly offensive."—*Macaggart's Canada*.

FIRESIDE ENJOYMENTS.

I DEARLY love what may be called fireside enjoyments. Music!—yes, it decidedly is, or ought to be, one; and a young lady employed in the exercise of that exquisite talent, for the purpose of soothing or enlivening the dear home circle, is ever an object of interest and affection. How delicious are some of our sweet ballads sung in the soft twilight—papa and mamma tranquilly listening to the well-remembered notes of 'The winter it is past,' 'The Birks of Endermay,' or the thrilling combination of sense and sound in the 'Exile of Erin,' and then blessing God for having given them an unspotted child, who, though it may be rich, and young and beautiful, derives more delight from their approval than from the applause of the gay and brilliant.

Books!—what pleasure do they not impart! Quick—draw the curtains—the circular table a littlenearer the fire; Emily, the dear little Emily, on her own particular stool at mamma's feet, her fine doll in her lap, which she is stealthily undressing, lest papa should be shocked at seeing it *en robe de nuit*; Martha, the good-natured Martha, arranging some flowers in her *hortus siccus*; Rebecca, the sage, the wise young woman of the family, pondering over 'The Foreign Review,' or the last 'Quarterly,' or the sound yet laughing 'Blackwood,' or my especial favourite, 'The British Magazine;' mamma investigating the contents of a 'tidy,' that newly invented receptacle of torn clothes, sighing over portions of the dilapidated wardrobe of seven children; papa turning the leaves of a musty folio, the stock-book of the household, for various purposes; while Alfred, the eldest hope of the family, stretches his feet on Pompey's silky coat, and tosses over and over an aged newspaper, from which (silly fellow) he knows he can derive no information. Gentle reader! fancy such a scene, in a country mansion, some forty or sixty miles from London, at the beginning of November; and fancy, also, old Daniel, or old Joseph, or old Samuel—any old servant will do—entering with a parcel, a London parcel of books! Just fancy the delight such an event must occasion to such a party, who are all, with the exception of mamma, who has too much to think of, and Emily, who does not think at all, somewhat *book wormish*; how charming! A parcel containing the best of Colburn's publications, for those seniors of the party who ought to know how the proceedings of the literary world are conducted; books from Westly and Davis, fit for the Sabbath and the serious; and such charming pretty-looking things from Hailes and Harris, as made even Emily forget her doll. A heap of delightful Annuals for those who love pretty pictures and rational amusements. How much are we indebted to them during the winter evenings, when out of doors the snow is deep and the wind piercing!

I might say, and with truth too, that, for very little masters and misses, a quiet game of blindman's buff is seasonable at Christmas time, particularly when a steady person is present to call 'fire,' and prevent mischief; though I almost fear that to express such an opinion is likely to bring me into disrepute with the young *élégantes*, and those very smart juvenile gentlemen who come under the denomination of *little dandies*—troublesome monkeys! I could better, by a thousand times, endure a good romping boy, than a mincing, finikin, perking, bowing, simpering Jimmy Jessamy, with kidded hands, perfumed handkerchief, and empty head. But I am sure all little creatures, roly-polys under eight, will forgive me, ay, and love me too, for tolerating blindman's buff.

I am sorry that needlework goes out of fashion; it is a gentlemanly amusement, and ought not to be neglected, particularly by those who have many brothers and sisters, and whose parents are not rich. Many girls, I am sorry to say, despise their needle, and affect to think work unfit occupation for genteel or intellectual beings. I both grieve for, and am angry with, such misses. I can tell them, that many of our high-born noble ladies employ their fingers in framing clothes for the poor and desolate widows and orphans of our distressed country. And I can also tell them, that the sensible and instructive Holland, the playful and highly-gifted Mitford, ay, and even the graceful and elegant Landon, think it no disgrace to form themselves the garbs in which they are always fascinating, because always unaffected. One advantage of the generality of female occupation is, that the mind can be engaged, either in hearing or reflecting, when the fingers are employed in plain work, or even in embroidering; and nothing is more delightful than a party enlivened by alternate reading and music where the greater number are not too fine to be industrious.—*Mrs S. C. Hall's Chronicles of a School-Room*.

ALPHABET OF INSECTS.

UNDER this title we are presented with the first of a series of elementary works, to be published under the general title of "Scientific Alphabets," by Professor Rennie, of King's College, London, a gentleman already well known to us as the author of several delightful works on natural history. As a specimen of the simplicity of his work, we beg to extract his account of the eggs of insects. Insects' eggs are not all of an oval form like those of birds, but some are like a pear, some like an orange, some like a pyramid, and some like a flask.

The eggs of the gnat, for instance, may be compared, in shape, to that of a powder-flask, and the mother gnat lays about three hundred at a time. Now, each egg, by itself, would sink to the bottom of the water; yet the gnat puts the whole three hundred together in the form of a little boat, and in such way that they will all swim on the surface of the water; and a very curious way she has of managing this.

Like other insects, the gnat has six legs. Four of these (the four fore-legs) she fastens to a floating leaf, or to the side of a bucket, if she is on the water contained in one. Her body is thus held level with the water, except the last ring of her abdomen, which is a little raised. This being done, she begins to make use of her other two legs (or hind-legs), and crosses them in the shape of the letter X. The open part of this X, next to her tail, serves as a kind of scaffolding, to support the eggs she lays, until the boat is formed. Each egg, when laid, is covered with a kind of glue; and the gnat holds the first laid egg in the angle of the X until the second egg is laid by its side, and glued to it; she then glues another egg to its other side. All these stick together thus, "X", making a kind of triangle, or figure of three, and this is the beginning of the boat. Thus she goes on, piling egg upon egg, always keeping the boat in proper shape by her useful hind-legs. As the boat grows in size, she pushes it from her by degrees, still adding to the unfinished end next to her body. When the boat is half built, her hind-legs are stretched out thus =; the X or cross form is no longer wanted, and she holds up the boat as cleverly as if it was done with two outstretched arms.

The boat is at length completed, and an excellent boat it is, quite water tight. For though it is very small and delicate, yet no tossing of the waves will sink it: and nothing can fill it with water, or turn it upside down. In fact, the glue with which it is covered prevents it from ever being wet. Even if the boat be pushed down to the bottom of the water, up it comes again quite dry: so that it is better than the best life-boat that has ever yet been invented.

The eggs of insects are not, like those of birds, always smooth, but are sometimes ribbed, and sometimes tiled, or otherwise sculptured or carved on the outside.

The shell of an insect's egg is rarely or ever brittle like that of a bird, but composed of a tough membrane, which in some instances can be stretched out, as appears from the eggs of ants and some other insects growing considerably larger in the process of hatching.

The mother insects usually dying before their eggs are hatched, do not sit upon them like birds, except in the singular instance of the earwig, which from the proceedings of one kept by me in a glass, in March 1832, appears to attend more to shifting the eggs about to places where they may receive moisture, than any thing like hatching by covering them. Ants shift their eggs according to the changes of the day and night, and also of the weather, placing them near the surface of their nests when it is warm and dry, and deep down when it is cold or wet.

In consequence of being exposed to the same temperature, all the eggs of any particular species, in any given district, are hatched exactly at the same time, or at most within a few days; and when such eggs are numerous, an immense number of caterpillars make their appearance all at once on plants and bushes, and give rise to the notion that they are brought by winds, or generated by what is called *blighting* weather, though this is as absurd as to say the wind could bring a flock of cattle, or that the *blight* could generate a flight of sparrows or rooks without eggs to hatch them from.

By looking carefully on the bark of rose or currant bushes, or on the back ribs of gooseberry leaves, the eggs may be found sometimes in patches, sometimes in rows, whence the caterpillars are hatched that creep into the buds, or stream over the leaves and devour them.

EDINBURGH: Published, weekly, by W. and R. CHAMBERS, 19, Waterloo Place; ORR & SMITH, Paternoster-row, London; and GEORGE YOUNG, Dublin. Agent in Glasgow, JOHN MACLEOD, 20, Argyle Street; and sold by all other Booksellers in Great Britain and Ireland.

Subscribers in town may have the paper left at their houses every Saturday morning, by giving their addresses at 19, Waterloo Place. Price of a quarter of twelve weeks, 1s. 6d.; of a half year of twenty-four weeks, 3s.; and of a year, 6s. 6d. In every case payable in advance.

From the Steam-Press of W. and R. CHAMBERS.

SATURDAY, JULY 28, 1832.

PRICE THREE HALFPENCE.

THEY.

BEFORE saying a word upon the subject, I must make an apology similar to that presented by honest Andro Symson, episcopal minister of a Galloway parish before the Revolution, when, in singing the praises of Sir David Dunbar of Baldoon, he says, his muse

—'gainst Priscian avers,
He, he ALONE, were my parishioners.

As good Andro's congregation of one required to be spoken of in the plural, so do my friends THEY need to be mentioned in the singular number. The truth is, THEY is a collective ideality, a most potent plural unit, who does a great many remarkable things in the world, without ever being called to account for them, and without any body knowing very distinctly who or what he is. I venture to say, that hardly a subject of his majesty does not, day by day, refer events and deeds to the agency of THEY, and yet never has presumed, to this blessed hour, to consider who this mysterious personage, this great unknown, this finer spirit than Ariel, can be. In very truth, he is a most impalpable being, and susceptible of a wonderful variety of shapes. There is no height of greatness, and no depth of degradation, which he may not arrive at. Sometimes one would suppose that he is the government itself—sometimes only a Town Council. One of THEY's employments is the disposal of criminals. "Are THEY going to hang this fellow?" one man will ask another. "Perhaps THEY will only banish him," is the probable answer. If the culprit be not decently and humanely hanged, the people get dreadfully enraged at THEY, and look as if they would almost tear his eyes out. THEY also has a great deal to do in public works. "Why did THEY make the road so crooked?" "THEY have put up a very absurd set of street lamps, I see." "What, in wonder's name, do THEY mean by building a temple up there, like a boy's peerie, or an hour-glass?" Then THEY is the author of all kinds of rumours and surmises. "They say,—what say they—let them say!" is an inscription on a wall within Aberdeen Cathedral, four hundred years old; and I do not doubt that THEY would have given currency to scandals regarding the mother of mankind herself, in Paradise, if there had been any other lady to tell them to—or if THEY had then existed. Old newspapers say, "THEY write from St Petersburg that the Empress Catharine is about to fit out an armament for the Caspian." "THEY talk at Rome of a change of counsels in the Vatican." Modern quidnuncs are also filled to the brim with things which THEY has been circulating. "THEY are now making out Lord — to be *non compos*." "THEY will have a marriage to be on the tapis between So and So and So and So; personages, by the way, who claim a sort of kindred with THEY, and certainly are of imagination all compact. THEY is sometimes admired for his power, sometimes blamed for his stinginess. "THEY used to write capital solid books long ago." "THEY used Burns very ill when he was alive." It certainly was bad of THEY to treat Burns so sourly; but unfortunately the fellow is so utterly impersonal, that we blame without knowing what we are doing.

THEY has a great deal to do with the *naming* of things. He may be called, in arithmetical language, the *Grand Denominator*. Indeed, I do not believe that Adam himself named more things than THEY. "What do THEY call this place?" one will ask a coachman, on nearing a town, village, or gentleman's seat. "THEY call it Ashbourne," or whatever else, is the reply. "What do THEY call ye?" is the ordinary question of a rustic boy to his unknown companion, and so forth. THEY is also the grand censor of all things which happen in the world. "I will not do this, for what would THEY say of me?" is a common expression, when a man hesitates upon some equivocal step. He may be convinced, from irrefragable data, of the propriety of what he contemplates; but then he could not convince THEY of it, and, of course, in these circumstances he must let the scheme drop. THEY thus prevents many things that would be bad, many things that would be only strange, and many things that would certainly be good, if he could be convinced of it. A most uncompromising fellow is this THEY! He knows very well that he cannot enter into another man's bosom, to see all the various reasons and tendencies which lead him towards the thing

he aims at; but, nevertheless, presuming that he is quite omniscient, or at least fully as well acquainted with every other particular man's business as his own, he never hesitates to give a decided contradiction to any proposal he is not, at first sight, pleased with. Many are the good original schemes which THEY has spoilt, from a hasty conclusion without premises.

THEY, also, amidst all his multitudinous and most Protean varieties of character, is a general scapegoat for all the mischief that is done in a household. "I see THEY have cracked that decanter." "THEY have at last made an end of the globe in the lobby." Or, as I once heard said by the lady of a house afflicted with a breaking woman-servant, "I declare THEY have broken the very kitchen poker!" a compound fracture, too, it was. Such are a few of the doings of THEY in his household capacity; and it must be owned that, in this light, he is very great, and often comes above-board. The grandest aspect, however, in which THEY ever appears, is when he stands up as a representative of the government of the country. "THEY are going, I see, to bring us into a war with France." "THEY intend, it seems, to resume cash payments at the Bank." No matter whether the affair refers to privilege or prerogative; no matter for the claims of the particular officer under whose hands it ought to fall; King, Lords, Commons, Treasury, Admiralty, and Horse Guards—all melt, like mixed colours, into the single white light of THEY! Things may be different under the reform bill; but, heretofore, there has hardly been any precise government but THEY. THEY crowns the king—signs the orders of council—passes all bills through the legislature, that will go through—fits out armies, and rigs fleets—makes war, and concludes peace—is church and state—Swing and the Press. THEY is a being of past history, and of present existence—a tyrant, or the people. THEY is the great despot pronoun of the world!

TRUST TO YOURSELF.

THIS is a glorious principle for the industrious and trading classes of the community; and yet the philosophy of it is not perhaps understood so well as it ought to be.

There is hardly any thing more common in the country than to hear men spoken of, who originally, or at some period of their lives, were rich, but were ruined by "*security*"—that is, by becoming bound to too great an extent for the engagements of their neighbours. This must arise in a great measure from an imperfect understanding of the question; and it therefore seems necessary that something should be said in explanation of it.

I would be far from desiring to see men shut up their hearts against each other, and each stand, in the panoply of his own resolutions, determined against every friendly appeal whatsoever. It is possible, however, to be not altogether a churl, and yet to take care lest we be tempted into an exertion of benevolence, dangerous to ourselves, while it is of little advantage to our friends.

Notwithstanding the many ties which connect a man with society, he nevertheless bears largely imprinted on his forehead the original doom, that he must chiefly be dependent on his own labour for subsistence. It is found by all men of experience, that, in so far as one trusts to his own exertions solely, he will be apt to flourish; and in so far as he leans and depends upon others, he will be the reverse. Nothing can give so good a *general* assurance of well-doing as the personal activity of the individual, day by day exerted for his own interest. If a man, on the contrary, suddenly finds, in the midst of such a career, a prospect of some patronage which seems likely to enrich him at once, or if he falls into the heritage of some antiquated claims to property or title, which he thinks it necessary to prosecute, it is ten to one that he declines from that moment, and is finally ruined. The only true way to make a happy progress through this world, is to go on in a dogged, persevering pursuit of one good object, neither turning to the right nor to the left, making our business as much as possible our pleasure, and not permitting ourselves to awake from our *dream of activity*—not permitting ourselves to think that we have been active—till we suddenly find ourselves at the goal of our wishes, with fortune almost unconsciously within our grasp.

Now, it is a most violent and unhappy disturbance of this system, to be always poking about after large favours from friends, whether for the purpose of adding fuel to what we think a good fire, or preserving a bad one from extinction. All that is obtained in this way is obtained against the very spirit of correct business, and is likely to be only mischievous to both parties. In the first place, it is probable that we shall not make such a good use of money got thus in a slump, without being painfully and gradually won, as of that which is the acquisition of our own daily industry. Then, it is always a presumption against a man that he should require such subsidies; and, accordingly, his commercial reputation is apt to suffer from every request he makes. Next, to consider the case in reference to the friend from whom the demand is made, it is obviously a most unfair thing, that, when men find it so necessary to be cautious in adventuring money on unusual risks, even for their own interest, and are, in such circumstances, so strongly called upon to make themselves acquainted with every circumstance of the case before venturing—when, moreover, they only do so in the prospect of an unusual profit—I say it is unfair, that, when they only adventure money on their own account under these circumstances, they should be called upon occasionally to adventure it for the profit of a friend, without knowing any thing of the likelihood of its turning out well, without being able to take any of those expedients which they would use in their own case for insuring its eventual re-appearance, without the least chance of profit to compensate the risk—trusting the whole, in fact, to the uncertain and hidden sea of another man's mind, when perhaps they would not trust it upon their own, with a full knowledge of soundings, tide, wind, and pilotage. Men may grant such favours, from their dislike to express such a want of confidence in a friend as a refusal is supposed to intimate. But this proceeds upon the erroneous principle that the refusal indicates want of confidence. In reality, it ought only to be held as indicating a want of confidence in the particular line of use upon which it is to be adventured. When the man *now* wanting the loan of money expresses himself as certain to reproduce it at the proper time, he pledges too much of his honour; for there cannot be a stronger proof of the unlikelihood of his having money *then* than his wanting it *now*, so that the uncertainty of the reproduction of the sum could never be greater. The person from whom it is demanded is entitled, therefore, to take care that the petitioner is not deceiving both himself and the individual whom he wishes to supply his necessities.

Humanity, kindred, friendship, have many claims; and these will always be considered and answered by a man of good feelings. All that is here contended for, is the inconsistency of a system of large accommodations with just business, as well as with the real interests of either of the two parties concerned. Upon the whole, a man will not only be obliging himself in the best manner, but he will also be obliging society in a higher degree than he otherwise could do, if he simply looks well after himself, so that he never requires a favour. Let no man be unduly alarmed at the outcry of "*selfishness*;" it is the only principle which can ever become nearly general, and therefore the only one which can be equal or impartial in its action. When this cry is raised, let the petitioned party always take pains to consider whether he in reality is the selfish person—whether the odium of that bad feeling does not indeed rather lie with the petitioner, who is content, for the purpose of saving himself some present inconvenience, or otherwise advantaging himself, to bring a portion of his friend's substance into hazard—for hazard, of course, there always is, whenever money leaves the possession of its owner, and in hardly any kind of adventure is it ever in greater peril than when lent, or engaged for, in this manner, without the prospect of a profit. It is, in a great measure, a mere error arising from want of reflection, to suppose that there can only be inhumanity on the part of the individual who refuses to lend or become bound. Inhumanity, of course, there may often be in such refusals; but is there to be no sympathy, on the other hand, for the friend betrayed? Are we only to have pity for the man who wants money—no matter through what causes he wants it—in March, and none for him

who is called upon to undertake the risk of having to pay it in June, to his grievous inconvenience? Does pity only acknowledge the present tense, and not the future? Is it so silly a passion that it only feels for the present wants of an individual who goes a-borrowing, and has no regard to the contingent sorrows of him who, without fault of his own, but with every merit to the contrary, is beguiled into a ruin he did not purchase, in the ineffectual attempt, perhaps, to save one who, supposing him to be personally as worthy, was at least the only person with whom blame, if blame there be, can in such a case be said to rest.

SUMMARY.—Fortune is most easily and most certainly to be won by your own unaided exertions. Therefore, depend as little as possible upon prospects of advantages from others, all of whom, you will find, have enough ado with themselves. Be liberal, affable, and kind; but, knowing that you cannot do more injury to society than by greatly injuring yourself, exercise a just caution in giving way to the solicitations of your friends. Never be too ready to convince yourself that it is right to involve yourself largely, in order to help any person into a particular station in society; rather let him begin at the bottom, and he will be all the better fitted for his place, when he reaches it, by having fought his way up through the lower stages.

THE VICTIM OF FACILITY.

As an illustration of the preceding little essay, we subjoin the memoirs of a person in real life, with which we have been supplied by a friend. We regret to be informed that the name alone is fictitious.

Heron of Bearcroft was the son of a clergyman in a remote part of Scotland, and, consequently, cannot be considered to have been born to great expectations; but the church, however poor in Scotland, is one of the few outlets for the families of men respectably born. Heron happened to be well connected, and by one accident and another, had, before he was thirty, succeeded, first to the farm and property of an uncle, considered worth about fifteen thousand pounds, and thereafter to the estate of another relative, which in those good days sold for at least fifteen thousand more. Here, one would think, was a princely fortune for a man born to no expectation whatever; and so it might have proved, had the possessor not been the most facile of human beings. Being unmarried, and known to be possessed of a fortune, he had many friends and visitors; and at length persons who at first considered it an honour to be received in his house, and who perhaps ought never to have been received in it, now lived and boarded there. The poor man, naturally social, though by no means riotous, was pleased with seeing people happy about him, and with hearing all their doings related as such high things. Affecting to remain unchanged by his good fortune, he still continued to occupy his uncle's farm; and pretending it did not suit a poor farmer to sport wine (which in these days, as the saying is, *was wine*), whisky was the only acknowledged drink of the house; though an impudent dog, by getting possession of the keys, might dig out a bottle of excellent port on occasion, or by going to the very bin he was forbidden to go to, perhaps one of claret or Burgundy. For the general drink of the house, there was a punchon like a grocer's store-cask in the cellar, and a barrel of sugar with a spade in it hard by. There were no regular dinners nor invitations, but there were very regular companies; and it was as regularly the rule that no company went on the day on which it came, or indeed for several days. In all events, come as they might, and stay as they might, poor Heron was too polite not to say he was glad to see them, and almost too good natured not to feel it. The consequences may be anticipated: late nights make bad morning men, and a bad morning man is a bad farmer. The farm was not only left to servants, but to servants satisfied they were under no effectual superintendence. The good-natured man not only kept an open house, but almost an open purse. He took payments as they were offered, conceiving every body to be honourable, as he was. He felt happy in having it in his power to oblige a friend, or to do a good action. He would take an acknowledgment or an obligation for money lent, if offered; but to exact it, or to dictate terms, would have been to doubt the honour of the parties. It may be supposed that in this way the fortune, which he conceived infinite, and which, indeed, would have been so to him, soon began to draw towards a limit. He saw it; but with an infatuation entirely common in higher men, but easily explicable in *their* circumstances, though not so in his, he could not think of being so rude as desire people to cease to devour his substance, who had been accustomed to it. I even recollect hearing, that, being in the market one day, and receiving one hundred pounds, a bet was taken, and, I am sorry to add, gained, that he could not refuse the loan of the money, though he was known himself to require it at the time. The person walked up, and, with some ridiculous preface, requested the loan. "Certainly, sir," said the infatuated man, drawing it from his pocket, and giving it. The bet was gained, but I do not recollect that it was added that the money was returned!

In a few years this person was a beggar; and having strongly in him the feelings of a gentleman, he was in a situation much more deplorable than that of most beggars. To prevent personal inconvenience, or to promote their own interests, some professional men,

who had known him in his better days, had his property placed under sequestration; and upon making the inspection usual in such circumstances, the state of things was deplorable. The furniture in the house was in a state of the greatest dilapidation, from the constant scenes of coarse revelry that had so long prevailed in it. All the servants were worthless as such, either from the total want of selection originally, or the habitual want of any rational superintendence. The horses and other stock, though most probably kept at much more expense than necessary, were almost in a starving state; but this was explained, by finding, on inspecting the barn, several bolls of grain, of different descriptions, stowed away among the straw, obviously deposited there by some servant for the purpose of being carried off, and either abstracted from the managers of the unfortunate animals, or deposited there instead of being carried to them. In short, all was ruin and dilapidation. A proper overseer being appointed, the farm assumed a very different aspect in a short time. The stock, being originally good, though abused, revived as by magic; the house was cleaned out; the furniture repaired and cleaned, with a view to sale; the servants even assumed a conduct and aspect as different as was the management of them; and, in short, all looked cheerful and prosperous, as it might always have been. The master only was unchangeable, or rather sunk into greater dejection. When the proper persons went to take possession of his house, he was found sitting at dinner. He had always been himself temperate, both in eating and drinking. His substance had been dissipated wholly by others. Persons in respectable circumstances had long ceased to visit him. He had no longer any suitable entertainments to give, or even the means of giving them suitably. His table ware had been destroyed, and not replaced; the knives and forks even had failed; and the servants, either overworked or careless, having no changes of table-linen, or deeming the guests unworthy of it, had ceased to think of supplying, or, at least, of cleaning it. Still he had guests! and when the persons above mentioned entered to strip him of every thing, he was sitting, in the utmost dejection it is true, with some beef and mutton bones before him, both in the same cracked dish, but dealing their remains to guests, who seemed, by their pertinacious adherence, determined to devour his last morsel.

These were all, as may be supposed, persons in desperate circumstances. They had received largely of this person's money to assist in their different schemes of life, but, instead of attending to their affairs, had preferred idleness and the hospitality of his house. Of course, they had not only never returned his money, but had in addition quartered themselves in his house; and it is questionable if they would not have considered abstaining to share his last crust a species of ingratitude!—a turning their backs upon their friend in his adversity! Be that as it may, there they were, and there they would have remained, had they not been brushed away by the same hand that removed their entertainer, and placed him on a temporary allowance, barely enabling him to support existence, in a quarter remote from all their usual haunts.

He came to Edinburgh, and there I had often occasion to see him; for having in his prosperous days warned him of the ruin that was coming upon him, he thought I must be able to devise some mode of alleviating it, now that it had happened. This, however, was impossible. The man who had proved so utterly incapable of managing his own affairs could not be considered fit to be entrusted with those of others. He could not labour; "and to beg he was ashamed." A small annuity, to be purchased by the bounty of those he had obliged, was the only thing that appeared possible in the circumstances. This was at first thought well of, for it was certain that many persons now in prosperous circumstances had received largely from him; and there being no vouchers of their debts, and, from this, no chance of their being recovered in the usual way, and for behoof of the creditors, it was hoped the subscription would be certain and liberal. Some of these persons did subscribe, in appearance liberally beyond their circumstances; but this led to inquiries, which showed that they had merely acted as decoys; and that, though he had taken no vouchers of *actual debt* from them, they had taken very sufficient guarantees against being called upon for any part of these unreal subscriptions! In short, the scheme entirely failed, and with it all the poor man's hopes. Even the pittance allowed by his creditors, was, it is said, withheld by their agent, or so negligently paid, that the object of their bounty often wanted even the bread they would have given him. As he sometimes stole to my residence in an evening, he at last mentioned these things; but as he seemed to feel keenly that they impeached his own prudence in times past, and his energy even now, he only muttered them through his teeth, as if his heart could not supply him strength to give them suitable utterance. His refusal to do justice to himself in any thing must at last have cooled all who wished him well; or, though his own hospitality had been taxed so unceremoniously, he must at last have declined to accept of any. Having confined himself at last on pretence of a severe cold, which, from inanition, and want of fire or covering, in an inclement season, he had doubtless caught, he appeared to have been forgotten. The consequences were melancholy. In a few weeks I was summoned to his funeral! and he appeared to have died from the want

of every comfort, or even necessary. He had neither had covering, food, nor fire, nor the means of procuring them! though he had never complained, nor would ever allow an exertion to be made for him—till too late. Then it was made without consulting him, but also without avail; and a man of an Herculean frame, and robust constitution, of temperate habits, and in possession of affluence, and never personally expensive in any thing; whose general information was extensive, his perceptions, as concerned others, clear, and his observations even keen and searching; who in this way showed that he had a very tolerable head, and whose heart was in the last degree honourable and affectionate; who had, in short, no fault so prominent as to excite observation, except an inexplicable FACILITY—this man, at the age of fifty-five, died a beggar, deserted and despised, with an exhausted constitution and a broken heart!

It would be painful even to think what must have been the feelings of this man when he lay down, as he doubtless did, abandoning all hope so far as this world was concerned, and desirous only to have done with it, and with existence. What a retrospect must have risen up to him, of comfort lost, and opportunities of doing good neglected; of money squandered, not only without doing good, but to the encouragement of idleness, dissipation, and every worthless propensity; assisting only the most unworthy and ungrateful, and depriving himself, by his over-confidence, of even the means of punishing them!—in short, of fortune and comfort lost, and talents misapplied. The man who is precipitated from fortune in spite of every honourable endeavour to the contrary, has some consolation in the reflection that he has done the best; but the thoughtless squanderer has no consolation. Reflection only embitters every misery; and unless he is of a mould very different from what is common in such cases, he sees no hope but in having done with life and consciousness together.

POPULAR INFORMATION ON SCIENCE.

ATTRACTION.

THE word attraction is employed to denote that power or force by which all kinds of matter, whether of the size of atoms or of worlds, are drawn towards each other. There is, perhaps, no law of nature which produces phenomena so universally and continually presented to our observation, as attraction. If we lift our eyes to the starry heavens, and observe the motion, or, as Milton terms it, the "mystic dance" of these shining orbs, we find it, like an invisible rein, curbing them in their amazing journeys through the trackless ether, and compelling them to deviate from the rectilinear or straightforward course in which they would otherwise run, and wheel in a circular manner round some other body, the centre of their orbits of motion. Or if we turn our attention to the globe we inhabit, we find it drawing down to the earth again the stone which we have thrown into the air; or we see it forming into a globe the little drop of dew which hangs like an appropriate gem upon the delicate leaf of a flower. Or we see two contiguous drops upon the same spray, when brought near to each other, but still situated at a distance sufficient to be discerned by the eye, at last suddenly rush together and become one. Or we can detect its operations in uniting a few simple substances in various proportions, and producing the wonders of vegetable organisation in infinite variety and never-failing symmetry! How sublime, yet how simple; how minute, yet how comprehensive and magnificent, is this law! at once exercising a power over the smallest atoms around us, while at the same time it is determining the revolutions of the gigantic and innumerable orbs that roll throughout the universe; a height and a depth, a breadth and a length of existence, which imagination in vain attempts to picture, or reason to calculate. This law is indispensable for the preservation and existence of the present order of things; and it would not be difficult to show that the suspension of it, even with respect to a single star, would, in course of time, spread disorder and anarchy throughout the universe. But its invariable operation is the certainty of destiny. Without this unchangeableness, philosophy would be only a doctrine of chances; but eclipses for thousands of years to come, for instance (supposing our world were to remain as it is for that period), can be calculated upon without fear of error, almost to the beat of the stopwatch!

The subject of attraction naturally separates itself into two grand divisions. There is, first, the attraction which is exercised by masses of matter, situated at sensible distances from each other; and, secondly, the attraction existing amongst the atoms constituting these masses, which takes place at insensible distances. These two heads are again subdivided, the former into the attractions of gravitation, electricity, and magnetism; and the latter into those of aggregation or cohesion; and chemical attraction or affinity. Many philosophers have supposed, and with some degree of plausibility, that all these varieties depend upon some ultimate power of matter, and may thus be reduced into one; yet as no conclusive argument has been adduced in support of the hypothesis, it is unnecessary to trouble the reader with speculative theories, even allowing that they are probably correct.

By gravitation is meant that power which draws the objects of the universe towards each other. The sublime genius of Newton, it is said, conceived the

idea of universal attraction from the simple incident of an apple falling from a tree in his garden. May not, he reasoned, the power which draws this apple to the ground with unerring certainty, be the same as that which regulates the movements of the celestial systems? And so, following up this idea, he made a series of discoveries the most brilliant that ever adorned the annals of philosophy. He proved satisfactorily that what we term *weight* is nothing more than an instance of universal attraction, which decreases in intensity as we recede from the earth in distance. This of course suggested the idea that weight must be less on the tops of mountains, and in balloons, than at the sea shore, or on plains, which is the fact. What weighs one thousand pounds at the sea shore, weighs five pounds less at the top of mountains of a certain height, as is proved experimentally by a spring balance; and, at the distance of the moon, the weight or attraction towards the earth of one thousand pounds is diminished to five ounces. This has been proved by astronomical tests.

Before proceeding farther, it may be necessary to inform the reader of the manner in which gravitation operates on its amplest scale in regulating the movements of the unnumbered orbs which compose the system of the universe. All bodies have a tendency to continue in the state of motion or of rest in which they are put. In other words, bodies do not acquire motion, nor lose motion, nor change the kind or degree of their motion, unless some force or another be applied to them. This property, as it may be termed, is called in scientific language the *inertia* of matter. For instance, when an arrow is shot from a bow, it would proceed onward through the infinity of space to all eternity, if some force did not curb its speed, and finally draw it to the earth. And what power is this? Plainly that of attraction. Besides, there is the resistance which the air offers to every body heavier than itself passing through it. Now, space originally was a vast vacuity, we shall suppose, in which there being no matter, there could exist none of the laws of matter. When the Divine Creator brought into existence our own system, to take a familiar instance, he placed the sun in the centre, and endowed it, so to speak, with power and authority over all the other bodies within its range; they were compelled to pay obedience to it like the surrounding sheaves to the central one in Joseph's dream. The lesser or subordinate orbs may be supposed, for the sake of illustration, to have been hurled from the plastic hands of the Deity in a straightforward course, in which they would for ever have moved, had not the sun possessed the power of attracting them to its centre, and compelling them to revolve round him. There was just as much attraction given as would keep them in their proper orbits of motion, and just that degree of impetus imparted which would prevent them from coalescing with the sun on the one hand, or departing beyond the sphere of his attraction on the other.

To this principle we are also indebted for the flux and reflux of the tides, which, as is well known, are caused by the moon's attraction. It is also the cause of the roundness of our earth, of the moon, the planets, and the sun itself. Hence it may be inferred that originally all matter was, to a certain extent, in a fluid state, and that at the divine behest the atoms were endowed with attractive qualities, by which they were impelled to a common centre, and thus the congregated masses assumed a globular form. At New South Wales, which is situated nearly opposite to England on the earth's surface, planets hang and stones fall towards the centre of the globe, just as they do here; and the people there are standing with their feet towards us: hence they are called our antipodes, from two Greek words—*anti* opposite, and *podes* the feet. A plummet suspended near the side of a mountain will be attracted to it in a degree exactly proportioned to its magnitude. This fact was ascertained by Dr Maskeleyne, near the mountain Shehallion in Scotland. But the plummet was not so strongly attracted to the mountain as it was to the earth, because the magnitude of the latter was so much greater than that of the former. Let it always be kept in view that it is size, in connection with distance, which determines the force of gravitation, and this may be illustrated by a few familiar facts.

A falling body receives fresh velocity every moment of its descent, while a body projected into the air loses velocity every moment of its ascent. Both propositions are illustrated by a very simple experiment. Sling a stone into the air, and the eye will be found incapable of following it till it has reached a certain height, when we can easily observe its progress. Upwards it rises slower and slower, and for a moment before it has reached and after it has passed its climax, there is scarcely any motion perceptible; just as the tide at the full appears for a moment neither to ebb nor to flow. Downwards the stone descends, however, gathering fresh velocity in every inch of its declination, until, as it approaches nearer to the earth, the eye can scarcely follow it. This may no doubt be partly accounted for from the well-known circumstance, that, to the eye, bodies seen at a distance seem to move slower than they do when we stand nearer to them. But, in our calculations, the fallacy arising from this circumstance is comparatively trifling. The propositions have not only been proved by the most incontestible philosophical experiments, but a few familiar facts, when recalled to memory, will settle the point. Let a ball drop from the hand, and

it can be caught easily the first instant; let it accumulate its motion, however, and the hand in vain pursues it. Take an instance on a vast scale—suppose the cataract of Niagara. Slow and heavily the broad column of waters bends over the precipice. It grows thinner and thinner, while its motion rapidly increases, until at last it plunges down the deep descent into the Phlegethon below, with irresistible force and swiftness, carrying all before it.

All bodies, whatever their size or weight may be, should, from the law previously laid down, fall to the ground with the same speed. But this is found not to be the case. Here, for instance, is a ball of lead and a ball of cotton dropped from the same altitude at the same moment, and the lead has reached the earth some time before the cotton. At first sight this would really appear to be quite consistent with the law of nature; because there being, we shall say, a hundred parts more matter in the bullet than in the cotton, it will be drawn to the earth with a hundred times more force, the power of gravitation being always proportioned to the quantity of matter. But again, if there be a hundred parts more matter in the lead than in the other body, it of course requires a hundred times more attraction to bring it down, for bodies destitute of this quality, as was formerly observed, have no tendency to fall; and every atom of every description of matter is drawn to the earth with the same degree of force. What is it, then, which prevents the cotton from reaching the ground at the same moment with the weightier body? The resistance of the air. The bulks are equal, and of course the resistance offered to both is alike, but the one having a far greater number of atoms, and hence a far greater power of attraction in proportion to its bulk than the other, it overcomes the resistance with greater ease, or, in other words, it has far greater strength to expend with only the same obstructions to overcome, and hence it reaches its destination sooner. For illustration's sake, let us suppose there are two boats to start for the same goal. They are of equal size, and of course their bows present the same breadth of surface to the water, and are alike impeded by it. In the one boat there are two rowers, we shall suppose, and in the other six. They all pull with equal skill and power, and it is unnecessary to say which boat will reach its destination first. But suppose that the boat which had the smallest number of rowers were to be reduced in size, weight, and resistance, in a proportion which exactly counterbalanced the power which the other had over it, they would both arrive at the same time. Thus, if the cotton ball were reduced to the density of the lead, they would both reach the earth at the same time. The powers of attraction possessed by the two substances, without attenuating our simile to an invisible thinness, may be compared to the physical energy exercised in the two several boats; and though the comparison be not perfect in some respects, it is sufficiently so in others to give a forcible illustration of the subject. In fine, it is found that in the exhausted receiver of an air-pump, that is, a glass vessel deprived of its air, a feather and a guinea fall to the bottom at the same instant. It would not serve the end contemplated were the subject of gravitation to be pursued through all its labyrinthine, and demonstrated by mathematical symbols. The point aimed at is rather to kindle up a desire for philosophical study, than to supply the materials of it.

It is unnecessary to enter more particularly into these subjects at present, as they will be investigated and explained in all their relations in some future numbers of this Journal.

We shall now turn to the other grand division of the subject, namely, the attraction exercised between particles of matter situated at short or insensible distances from each other. Cohesive attraction is that power which retains atoms of the same kind together in masses. When two drops of the same sort of liquid are placed near to each other, as was remarked at the commencement, they attract each other, and uniting together, form one globule. The roundness of the drop is caused by this attraction. If two globules of quicksilver on a smooth surface be brought near to each other, they will unite in a similar manner. They have also a tendency to remain in this state, and will not separate until some force be applied. Cohesion is strongest in solids. For instance, a bar of iron of half an inch in diameter, or even less, will defy all our efforts to break it with the hand. In fluids, the power is a great deal weaker, as is proved by the ease with which we can separate one portion of water from another. Small needles, however, can be made to float on water, their weight not being sufficient to overcome the cohesion of the fluid. In the same way many small insects walk on the surface of water without being wetted. In gaseous bodies, such as air, this attraction is entirely overcome, and a mutual repulsion exists amongst the particles, which is the cause of their elasticity. Cohesion is illustrated by the following facts:—When portions of the same size are cut from two leaden bullets, and the fresh surfaces being brought into contact, and slightly pressed, they will unite, and appear as if they had been originally cast in one piece. Fresh-cut surfaces of India-rubber cohere in a similar manner. There is a species of attraction called *adhesive* attraction, instances of which come frequently under observation. If water be poured from a jug which has not a projecting lip, it will not fall perpendicularly, but run down the outside of the vessel. Hence the reason of having a spout to such utensils. A plate of glass,

when brought into contact with a level surface of water, adheres to it with considerable tenacity, and resists a separation. Pieces of wood floating in a pond attract each other, and remain in contact; and the wrecks of vessels, when the sea is smooth, are often found gathered together in heaps.

There is a species of attraction called *capillary*, which takes place under the following circumstances:—When one end of an open glass tube is put into water, the enclosed liquid stands above the level of that on the outside, and it rises always the higher the smaller the bore of the tube is; the surrounding glass, being thus nearer to the water, attracts it more powerfully. A piece of lump sugar, whose lowest corner touches the water, soon becomes moistened throughout. Thus also the wick of a lamp or candle draws up the oil or tallow to supply combustion. The sap which rises from the roots to the tops of vegetables, though chiefly an action of vegetable life, partly depends on capillary attraction for its ascent.

We come now to a most important and interesting part of the subject, namely, *chemical attraction*, or *affinity*.

There are in nature about fifty-four substances, which are termed elements, from the impossibility of human skill or industry to reduce them to any thing simpler. These elements, uniting together by the power of chemical attraction, form the infinite variety of objects around us. The investigation of this subject, from its great extent and vast importance, would require a separate article of itself to do it any thing like justice; but we hope to be able to give a general idea of it, sufficiently attractive to induce the reader to pursue the subject in more laborious compilations.

Chemical attraction is exercised between particles of dissimilar bodies, which, uniting, form a new substance possessing properties different from those of its ingredients. Frequently, indeed, the qualities of the compound are exactly the opposite of those of its constituents, as in the case of water. This liquid is composed of hydrogen, one of the most inflammable bodies known, and oxygen, the grand supporter of combustion on the globe. Yet when these are united, they form a fluid possessing qualities so totally different from their own, that it destroys all flame whatsoever, unless, indeed, the heat be so intense as to decompose the water; and frequently the same component parts, when united in different proportions, produce the most opposite substances. Thus the common air which we breathe is composed of the very same elements as aquafortis. All bodies have not a chemical attraction for each other. Thus oil and water, though shaken together, will never be made to unite; but if lime water is employed, a union takes place, and the result is a new compound, which is insoluble in water. Again, sulphuric acid, or vitriol, will not dissolve or unite with gold; but it will with copper or iron (besides a great variety of other bodies), forming in the first instance sulphate of copper or blue vitriol; and in the second, sulphate of iron or copperas. Common sea sand and soda, when heated together, attract each other, and, combining, form glass. What are called acids and alkalis have a strong affinity for each other, and their compounds form a class of substances called salts, which are most important in the arts and manufactures. Oil of vitriol and soda, for instance, combine with great facility, and the compound is Glauber salt.

Thus, by the existence and exercise of this peculiar property of matter, are formed the endless diversity of substances which constitute the mass of our globe. It is impossible to contemplate the subject of attraction in general, without a feeling of religious reverence and awe for the Divine Being who drew the mighty plan, set it in motion at first, and sustains it so still. But the wisdom of it is not more conspicuous than the benevolence. Indeed, the operations of all the various laws of nature are to man so many various sources of enjoyment. He stands as it were the centre of the system of life and nature around him. What attraction is in the abstract, human sagacity has not yet, and probably never will, unravel.

The chain of cause and effect here breaks off, or rather for the present may be said to terminate in the Deity. Future philosophers, however, may discover a proximate cause, and even trace the golden links through a thousand beautiful windings, but in a Divine Creator they must merge at last.

THE CROOKED STICK.

[By Mrs S. C. HALL.]

"And took the crooked stick at last!"

"Even so."

I HAVE rarely known any one, of either sex, who deliberated upon the matrimonial question until their hair silvered, and their eye dimmed, and then became numbered among the "newly wed," who did not, according to the old story, "take the crooked stick at last." All, doubtless, will remember the tale, how the maiden was sent into a green and beautiful lane, garnished on either side by tall and well-formed trees, and directed to choose, cut, and carry off, the most straight and seemingly branch she could find. She might, if she pleased, wander on to the end, but her choice must be made *there*, if not made *before*—the power of retracing her steps, *without* the stick, being forbidden. Straight and fair to look upon were the charming boughs of the lofty trees—fit scions of such noble ancestry; and each would have felt honoured by her preference; but the silly maid went on, and on, and on, and thought within herself, that at the termination of

her journey she could find as perfect a stick as any of those which then courted her acceptance. By and bye, the aspect of things changed; and the branches she now encountered were cramped and scragged—disfigured with blurs and unseemly warts. And when she arrived at the termination of her journey, behold! one miserable, blighted wand, the most deformed she had ever beheld, was all that remained within her reach. Bitter was the punishment of her indecision and caprice. She was obliged to take the crooked stick, and return with her hateful choice, amid the taunts and the sneers of the straight tall trees, who, according to the fashion of the good old fairy times, were endowed not only with feeling and reason, but with speech!

Many, I fear me, are the crooked sticks which "the ancient of days," by a strange infatuation, compel themselves to adopt. And much might be gravely and properly said upon this subject, for the edification of young and old; but the following will be better than grave discussion, and more to the tastes of those who value scenes from real life.

"Lady Frances Hazlitt, Charles! Surely the most fastidious might pronounce her handsome?"

"My dear fellow, you must permit me to correct your taste. Observe, I pray you, the short chin, and that unfortunate nose; it is absolutely *retroussé*."

"It may be a little opposed to the line of beauty—calculated to overset it, perhaps; but did you ever see such a glorious brow?" "Mountainous!" "Such expressive eyes?" "Volcanoes!" "Paha!—such grace?"

"Harry," replied the young nobleman, smiling according to the most approved Chesterfield principle, removing his eyeglass, and looking at his friend with much composure, "you had better, I think, marry Lady Frances yourself."

"You are a strange being, my good lord," replied his friend, after a pause. "I would wager a good round sum that, notwithstanding your rank, fortune, and personal advantages, you will die—or, at all events, not marry until you are—a veritable old bachelor. I pray thee, tell me, what do you require?—A Venus?—A Diana?—A Juno?—A—a—"

"Simply a woman, my dear fellow; not indeed one of those beings arrayed in drapery, whom you see moving along our streets, with Chinese features, smoke-dried skins and limbs that might rival those of a Hercules; nor yet one of your be-scented, spider-waisted primities, who lisp and amble—assume a delicacy which they never felt, and grace which they never possessed. My ideas of woman's perfections—of the perfections, in fact, which I desire, and—I may say—Lord Charles Villiers was certainly a very handsome and a very fashionable man, and yet his modesty, I suppose, made him hesitate in pronouncing the latter word)—"I may—I think—say *deserve*," gaining courage as he proceeded, "are not as extravagant as those required by your favourite Henri Quatre. He insisted on *seven* perfections. I should feel blessed if the lady of my love were possessed of *six*."

"Moderate and modest," observed his friend, laughing; "I pray you tell me what they are?"

"Noble birth, beauty, prudence, wit, gentleness, and fidelity." Sir Harry Beauclerc drew forth his tablets, and on the corner of the curiously-wrought memorials engraved the qualities Lord Charles had enumerated, not with fragile lead, but with the sharp point of his penknife. "Shall I add," he inquired, "that these requisites are indispensable?"

"Most undoubtedly," replied his lordship.

"Adieu, then, Charles—Lady Frances's carriage is returning, and as you declare fairly off, I truly tell you that I will try to make an impression on her gentle heart; you certainly were first in the field, but as you are insensible to such merit, I cannot think you either deserve to win or wear it. Adieu! *au revoir*!" And with a deeper and more prolonged salute than the present courtesies of life are supposed to require, the two young fashionables separated—one lounging listlessly towards the then narrow and old-fashioned gate which led from Hyde Park into Piccadilly, trolling snatches of the last *cavatina*, which the singing of a Mara or a Billington had rendered fashionable; the other proceeding, with the firm and animated step that tells plainly of a fixed purpose, to meet the respectable family carriage, graced by the really charming Frances, only daughter of the Earl of Heaptown.

To look forward for a period of five-and-twenty years blanches many a fair cheek, and excites the glow of hope and enthusiasm in those of vigorous and determined character; while the beauty trembles for her empire—the statesman for his place—the monarch even for his throne—those who have nothing to lose, and every thing to gain, regard the future as an undefinable something pregnant with light and life; to such, diamond-like are the sands that sparkle in the hour-glass of Time, while the withered hand which holds the mystic vessel is unheeded or unseen. So be it—so, doubtless, it is best. One of the choicest blessings bestowed by the Creator on the creature is a hopeful spirit!

Five-and-twenty summers had passed over the brow of Lord Charles Villiers since Sir Harry Beauclerc noted on his tablet the six indispensable qualities the young nobleman would require in his wife. The lord still remained an unmarried and an admired man, seeking to find some lady worthy his affections. It is true that some of the young creatures, just come out, on whose cheek the blush of innocence and modesty

still glowed, and whose untutored eyes prated most earnestly of what passed in the sacred citadel, called heart—such creatures, I say, did discover, to the sad annoyance of their speculating mothers, and sensible—(heaven bless the word!)—sensible chaperons, that Lord Charles's *once* beautiful hair was now indebted to "the Tyrian dye" for its gloss and hue; and that, moreover, a most ingenious scalp mixed its artificial ringlets with his *once* exquisite curls, that the belles (whom a few years had rendered staid mammas, and even grand—I cannot finish the horrid word) used to call, in playful poetry, "Cupid's bowstrings." Then his figure had grown rotund: he sat long after dinner, prided himself upon securing a cook fully equal to Ude—(I write it with all possible respect)—equal to Eustache Ude in his best days; desoated upon the superiority of pheasant dressed *en galantine*, to that served in aspic jelly; and gained immortal honour at a committee of taste, by adding a most *piquant* and delightful ingredient to Mr Dolby's "*Sauce à l'Aurore*." These gastronomical propensities are sure symptoms of increasing years and changing constitution; but there were characteristics of "old boyishness" about Lord Charles, which noted him as a delightful gentleman "*of a certain age*." A rich silk handkerchief was always carefully folded, and placed within the bosom of his exquisitely made Stultz, ready to wrap round his throat when he quitted the delightful crush room of the delightful Opera, to ascend his carriage: then an occasional twinge reminded him of the existence of gout—a most unpleasant reminiscence in the galopade, which he was hardy—I had almost said *fool-hardy*—enough to attempt. Had he not been so perfectly well bred, he would have been considered touchy and testy: the excellent discipline of the old school fortunately preserved him from those bachelor-like crimes, at all events in ladies' society: and whatever spleen he had, he wisely only vented on those who could not return it; namely, his poor relations, his servants, and occasionally, but not often (for he was a member of the society for preventing cruelty to animals), on his dogs and horses. However, his figure was as erect, if not as graceful as ever; and many a fair lady sighed at the bare idea of his enduring to the end in single misery.

Sir Harry Beauclerc never visited London except during the sitting of Parliament; and it was universally allowed that he discharged his duties as M. P. for his native county with zeal and independence. Wonderful to say, he neither rattled nor sneaked; and yet Whigs, Tories, and Radicals, treated him with deference and respect. He had long been the husband of her who, when our sketch was commenced, was known as Lady Frances Hazlitt; and it would be rare to behold a more charming assembly of handsome and happy faces than their fireside circle presented at the celebration of merry Christmas. The younger portion of this family were noisily and busily occupied at a game of forfeits, while those who considered themselves the elders of the juvenile set, sat gravely discussing matters of domestic or public interest with their parents, when a thundering peal at the portal announced the arrival of some benighted visitor. I am not about to introduce a hero of romance at such an unseemly hour—only our old acquaintance Lord Charles, who claimed the hospitality of his friend as protection against an impending snow-storm. When the family had retired for the night, a bottle of royal Burgundy was placed on the table as the sleeping cup of the host and his guest; old times were reverted to; and Sir Harry fancied that there was more design than accident in the visit with which he had been honoured. This feeling was confirmed by Lord Charles drawing his chair, in a confidential manner, towards his friend, and observing that "he was a lucky and a happy fellow to be blessed with so lovely a family and so amiable and domestic a companion." Sir Harry smiled, and only replied that he was happy; and he hoped his friend would not quietly sink into the grave without selecting some partner, whose smiles would gild the evening of his days, &c. &c. A fine sentimental speech it was, but ill timed; for the gallant bachelor suffered it to proceed little farther than "evening," when he exclaimed, "Faith, Sir Harry, you must have strange ideas. Evening! I consider myself in the prime and vigour of existence; and I have serious ideas of changing my condition—it is pleasant to settle before one falls into the sere and withered leaf. And although, as I said before, I feel myself in the very vigour of life, yet it is time to determine. You are considerably my senior—"

"Only a few months, my dear friend—my birthday is in May, yours in the January of the next year."

"Indeed! Well, to tell you the truth (it is however a profound secret, and I rely on your friendship), I am really a married man!—There—I knew I should surprise you. I shall surprise every body."

"Most sincerely do I wish you joy, my dear lord, and doubt not your choice is fixed upon one who will secure your happiness. I am sure Lady Frances will be delighted at an introduction. Your pardon one moment, while I relate a most extraordinary coincidence. Do you remember my noting down the six perfections which you required the lady of your choice to possess?—perhaps you recollect it was some five-and—But no matter—well, the tablets upon which I wrote this morning—only this very morning, I was looking over a box of papers, and, behold! there they were—and do you know (how very odd, was it not?) I put them in my waistcoat pocket," continued the

worthy baronet, at the same moment drawing them forth, "intending to show them to my eldest son—for there's a great deal—I assure you I speak in perfect sincerity—a great deal—my dear lord, what is the matter?—you look ill." To confess the truth, Lord Charles appeared marvellously annoyed—he fidgetted on his chair—the colour heightened on his cheek, and he finally thrust the poker into the fire with terrific violence. "Never mind the tablets, my good friend," said he at last; "men change their tastes and opinions as they advance in life—I was a mere boy then, you know, full of romance."

"Your pardon, my lord—less of romance than most young men," replied the persevering and tactless baronet, who was, moreover, gifted with a provokingly good memory, "decidedly less of romance than most young men—and not such a boy either. Here are the precious mementos. First on the list stands 'NOBLE BIRTH'; right, right, my dear lord, nothing like it—that (*entre nous*) is Lady Frances's weak point, I confess; she really carries it too far, for she will have it—that not even a royal alliance could purify a citizen." Lord Charles Villiers looked particularly dignified as he interrupted his zealous friend. "It is rather unfortunate," he observed gravely, "that I should have chosen you as my confidant on this occasion; the fact is, that, knowing how devilish proud all my connections are, and my Mary—what a sweet name Mary is!—you remember Byron's beautiful lines,

'I have a passion for the name of Mary!'

—my Mary's father was only a merchant—a—a citizen—a very worthy—a most excellent man—not exactly *one of us*—but a highly respectable person, I assure you: his name is Soroggins."

"Powers of fashion!" mentally ejaculated the baronet, "will it—can it be believed—the courted, the exquisite Lord Charles Villiers—the glass of fashion and the mould of form—the star, the idol of *ton* and taste—married—positively married to Molly Soroggins of Bunhill Row!"

"I am anxious, I do confess, that Lady Frances should receive Lady Charles Villiers *here*," persevered his lordship, after a very long pause; and I can answer for it, that the native and untutored manners of my unsophisticated bride would gain hourly upon her affections."

"Of course—of course, we shall be most happy to receive her ladyship," stammered forth the baronet; "and doubtless her *BEAUTY*—glancing at the tablets—"

"Pardon me, Sir Harry," interrupted the nobleman; "you must not expect what in our world is denominated *Beauty*—she is all animation—"

'Happy nature, wild and simple—'

rosy and laughing, but not a beauty, believe me."

Again the astounded baronet pondered. "What a subject for Almack's!—the rosy (doubtless signifying red-faced), laughing (meaning romping) daughter of some city butlerman, thrust into the peerage by the folly of a man who might have plucked the fairest, noblest flower in the land!"

"At all events," he said, when his powers of articulation returned, "your lady is endowed with both *PRUDENCE* and *WIT*, and nothing so likely to create a sensation in the *beau monde* as such a combination."

"Oh, yes—*prudence* I dare say she will have, much cannot be expected from a girl of seventeen; and as to *wit*, between you and me, it is a deuced dangerous and troublesome weapon, when wielded by a woman."

"A flirt and a fool, I suspect," again fancied Sir Harry, "in addition to her other qualifications."

"GENTLENESS and FIDELITY," he ejaculated, fixing his eyes on the unfortunate tablets, while Lord Charles, evidently determined no longer to endure the baronet's untimely reference to the detestable memorials, snatched them (it is perfectly astonishing what rude acts *polite* persons will sometimes perform) from the hand of his friend, and flung them into the fire.

"Heavens and earth, sir! what do you mean by such conduct?" said Sir Harry, at the same time snatching them from the flames. "These ivory slates are dear to me as existence. I must say that I consider such conduct very ungenerous, ungentlemanly," &c. &c. One angry word produced another; and much was said which it would ill befit me to repeat. The next morning, even before the dawn of day, Lord Charles Villiers had quitted Beauclerc Hall, without bidding a single farewell either to its lady or its master.

"There!" exclaimed the baronet, placing the fashionable "Post" in Lady Frances's hand at the breakfast table one morning, about three months after the above scene had taken place; "I knew how it would be; a pretty fool that noble friend of mine, Lord Charles Villiers, has made of himself. I never knew one of these absurdly particular men who did not take the crooked stick at last. By Jove, sir," (to his son), "you shall marry before you are five-and-twenty, or you shall be disinherited! The youthful mind is ever pliable; and the early wed grow into each other's habits, feelings, and affections. An old bachelor is sure either to make a fool of himself, or be made a fool of. You see his lordship's wife has publicly shown that she certainly did not possess the last of his requisites—FIDELITY—by eloping with her footman. I will journey up to town on purpose to invite Lord Charles here, and make up matters; he will be glad

to escape from the *desagremens* of exposure just now, as he is doubtless made a lion for the benefit—as Sir Peter Teazle has it—of all old bachelors.”—*Edin. Literary Journal*.

THE INVENTION OF “IRISH BLACKGUARD.”

LUNDY FOOT, the celebrated snuff-manufacturer, some six-and-twenty years ago, had his premises at Essex Bridge, in Dublin, where he made the common-scented snuffs then in vogue. In preparing the snuffs, it was usual to dry them by a kiln at night, which kiln was always left in strict charge of a man appointed to regulate the heat, and see the snuffs were not spoiled. The man usually employed in this business, Larey by name, a tight boy of Cork, chanced to get drunk over the “cratur” (i. e. a little whisky), that he had gotten to comfort him, and, quite regardless of his watch, fell fast asleep, leaving the snuff drying away. Going his usual round in the morning, Lundy Foot found the kiln still burning, and its guardian lying snoring with the fatal bottle, now empty, in his right hand. Imagining the snuff quite spoiled, and giving way to his rage, he instantly began belabouring the shoulders of the sleeper with the stick he carried.

“Och, be quiet wid ye; what the devil’s the matter, master, that ye be playing that game?” shouted the astounded Larey, as he sprang up and capered about under the influence of the other’s walking cane.

“You infernal scoundrel, I’ll teach you to get drunk, fall asleep, and suffer my property to get spoiled,” uttered the enraged manufacturer, as each word was accompanied by a blow across the dancing Mr Larey’s shoulders.

“Stop! stop! wid ye, now! sure you wouldn’t be ather spaking to ye’r ould sarvant that way—the snuff’s only a little dryer, or so, may be,” exclaimed “the boy,” trying to soften matters.

“You big blackguard you, didn’t you get drunk and fall asleep?” interrogated his master, as he suspended his arm for a moment.

“Och, by all the saints, that’s a good ‘un now—where can be the harm of slaapping wid a drop or so? besides—but hould that shillelah—hear a man spake rason.”

Just as Lundy Foot’s wrath had in some degree subsided in this serio-comic scene, and he had given the negligent watcher his nominal discharge, who should come in but a couple of merchants? They instantly gave him a large order for the snuffs they were usually in the habit of purchasing, and requested to have it ready for shipping by the next day. Not having near so large a quantity at the time by him, in consequence of what had happened, he related the occurrence to them, at the same time, by way of illustration, pointing out the trembling Larey, occupied in rubbing his arms and back, and making all kinds of contortions.

Actuated by curiosity, the visitors requested to look at the snuff, although Lundy Foot told them, from the time it had been drying, it must be burnt to a chip. Having taken out the tins, they were observed to emit a burnt flavour any thing but disagreeable, and on one of the gentlemen taking a pinch up and putting it to his nose, he pronounced it the best snuff he had ever tasted. Upon this, the others made a similar trial, and all agreed that chance had brought it to a degree of perfection before unknown. Reserving about a third, Lundy Foot sold the rest to his visitors. The only thing that remained now was to give it a name; for this purpose, in a facetious mood, arising from the sudden turn affairs had taken, the master called his man to him who was lingering near—“Come here, you Irish blackguard, and tell these gentlemen what you call this snuff, of your own making.”

Larey, who did not want acuteness, and perceived the aspect of things, affected no trifling degree of sulky indignation, as he replied—“And is it a name ye’r in want of, sir?—fah! I should have thought it was the last thing you couldn’t give; without, indeed, you’ve given all your stock to me already. You may even call it ‘Irish Blackguard,’ stidd of one Michael Larey.”

Upon this hint he spake, and as many a true word is spoken in jest, so was it christened on the spot. The snuff was sent to England immediately, and to different places abroad, where it soon became a favourite to so great a degree, that the proprietor took out a patent, and rapidly accumulated a handsome fortune. Such are the particulars connected with the discovery of the far-famed Lundy Foot, or Irish Blackguard—for which we are indebted to a member of the Irish bar, who was a resident in Dublin at the time.”—*Miller’s Nootiana*.

LIBERTY.

Shame! that any should have been found to speak lightly of liberty, whose worth is so testified—whose benefits are so numerous and so rich. Moralists have praised it—poets have sung it—the gospel has taught and breathed it—patriots and martyrs have died for it. As a temporal blessing, it is beyond all comparison and above all praise. It is the air we breathe—the food we eat—the raiment that clothes us—the sun that enlightens, and vivifies, and gladdens, all on whom it shines. Without it, what are honours and riches, and all similar endowments? They are the trappings of a hearse—they are the garnishings of a sepulchre; and with it the crust of bread, and the cup of water, and the lowly hovel, and the barren rock, are luxuries

which it reaches and enables us to rejoice in. He who knows what liberty is, and can be glad and happy when placed under a tyrant’s rule, and at the disposal of a tyrant’s caprice, is like the man who can laugh and be in merry mood at the grave, where he has just deposited all that should have been loveliest in his eye, and all that should have been dearest to his heart. What is slavery, and what does it do? It darkens and degrades the intellect—it paralyses the hand of industry—it is the nourisher of agonising fears and of sullen revenge—it crushes the spirit of the bold—it belies the doctrines, it contradicts the precepts, it resists the power, it sets at defiance the sanctions, of religion—it is the tempter, and the murderer, and the tomb, of virtue—and either blasts the felicity of those over whom it domineers, or forces them to seek for relief from their sorrows in the gratifications, and the mirth, and the madness, of the passing hour.—*Dr A. Thomson’s Sermons*, 1829.

ST DOMINGO, OR HAITI.

ALL the world has heard of the revolution which, upwards of thirty years since, was effected in the island of St Domingo, in the West Indies, by the rising of the slave population, and the massacre of their French masters. The subsequent establishment of a free government of blacks, and the absence of all foreign or white interference in the government of the island, naturally raise our curiosity, and lead us to inquire how these negroes have conducted their affairs, or if they be in reality more comfortable than they were under the surveillance of the French and Spanish monarchies. The publication of a work entitled, “Notes on Haiti” (such being now the ordinary name of the country), by Charles Mackenzie, Esq. late his majesty’s consul-general in Haiti, gives us an opportunity of gleanings a number of instructive particulars regarding this interesting republic, and may here be taken advantage of. The period of Mr Mackenzie’s visit was 1826-7. It will be recollected that the population of Haiti still speak the French language.

Port-au-Prince, the capital of the island, and the seat of government, is situated at the bottom of a very deep bay, and nearly surrounded by marshy ground. Under a burning sun, it is eminently unhealthy, and its insalubrity is not a little increased by the interruption that the sea-breeze meets with in its progress from the island of Genave, which blocks up the entrance to the bay. During the months of May, June, July, August, and September, the heat is most intense; for a considerable time my thermometer reached ninety-nine degrees every day in the shade. The consequence of these concurrent causes is mortal disease among new comers. The climate and new rum are omnipotent. The practice of attending funerals is carried to an extraordinary height, and I can with truth declare that all the invitations I received for the first six months of my residence were to funerals.

I have been repeatedly asked, is there any court in Haiti? Were I to answer directly, I should say that there is none according to the European standard, and I suspect that there is nothing to correspond with the republican levees of Washington. Sunday is the only fixed public day, and at six o’clock in the morning the President receives all persons, whether natives or foreigners. Besides these weekly exhibitions, there are three days consecrated by the thirty-fourth article of the revised constitution of 1816 to public festivity, and in each of these the President holds a public court. The days are the 1st of January, the anniversary of Haitian independence; the 2d of April, that of the birth of Petim, the founder of the republic; and 1st of May, that of the establishment of the ‘Fête d’Agriculture.’

The subjects or citizens of the district of Port-au-Prince were divided into three great classes; viz. a very few white men—every shade of colour between white and black—and the negroes. In the order of their numerical proportions, they stand thus: black, coloured, white. The first two of these classes are again subdivided in reality (though all professing a common allegiance) into all the national distinctions of Europe and America; for by the forty-fourth article of the constitution, all Indians, Africans, and their descendants, whether of mixed or pure blood, may become citizens after a residence of twelve months. The residence, however, is often dispensed with, though contrary to the theory of the constitution. Hence Haiti, in general, becomes a place of refuge to all persons of those classes, who either have, or suppose themselves to have, reason to be dissatisfied with their own country; and the capital, from natural causes, is the place of principal resort, especially on first emigration. The remainder are native-born Haitians, having every peculiarity of opinion that may be imagined to have been engendered by their situation and circumstances. Such at least is the opinion of the best-informed persons, natives as well as strangers. Notwithstanding the discordance of these materials, the government asserts that all the feelings and prejudices, either of the olden time, or on the subject of colour, or on that of natural origin, have been absorbed by intense patriotism; others, again, aver that in no part of the world do prejudices and feelings exist to so great an extent as in the capital itself, and I am disposed to fear that the latter opinion is the most correct, from many facts; but most especially so from the maintenance of the 38th article of the constitution, which proscribes all whites from being citi-

zens, in spite of the conviction of the most enlightened of the chiefs, who, I cannot but believe, reluctantly defer to the prejudices of the many. I made many inquiries on this point; for besides its importance in determining the political concord of the republic, I was curious to ascertain how far a revolution, preceded by an hostility to prejudice of colour, had ended, with reference to what has been professed to be its most active immediate cause.”

We cannot but esteem the above account of the state of citizenship as exceedingly worthy of attention. It no less than appears that in the vaunted black republic of Haiti there is a law to prevent white men becoming free citizens, or, in the words of the 38th article of the constitution, “Aucun blanc, quelque soit sa nation, ne pourra mettre les pieds sur ce territoire à titre de maître ou de propriétaire.” Alas, for poor human nature. We are informed by the author that the indolence which pervades all ranks and all hues of the people, is a striking feature in their character. A general air of listlessness, which may be aptly described as “a death-like languor which is not repose,” pervades all classes. This national indolence of the free blacks of Haiti is described as being the means of keeping the country almost in a state of nature. To such an extent is this carried, that whole districts are now found covered with tall rank weeds, which within the last thirty years were covered with sugar establishments. Of a place called Lator, the author mentions that there were “formerly one thousand seven hundred carreaus (each containing about three hundred and eighty square French feet) in canes; above one thousand five hundred slaves were employed on it; three sugar mills were constantly at work, and excellent sugar was made. Now about seven carreaus are in cultivation; not fifty labourers are employed; and the only produce is a little syrup and tafia, which last is retailed in a small shop by the road side, in front of the President’s residence.

“The very little field labour effected is generally performed by elderly people, principally old Guinea negroes. No measures of the government can induce the young creoles to labour, or depart from their habitual licentiousness and vagrancy. The whole body of proprietors constantly lament the total incapacity of the government to enforce labour. In reply to inquiries I made respecting corporal punishments, I have the following answers:—The laws recognise no other punishment than fine and imprisonment with hard labour, although it is no uncommon thing to see the soldiery and military police use a species of heavy jointed cane in a most arbitrary and sometimes cruel manner; but almost always, from the natural obstinacy of the negroes, without the intended effect. The few young females that live on plantations seldom assist in any labour whatever, but live in a constant state of idleness and debauchery. This is tolerated by the soldiery and military police, whose licentiousness is gratified by this means. The rent of land is from two to three dollars an acre, and money is lent at 75 per cent per annum!”

The author afterwards informs us that in that portion of the island formerly under the Spanish government, the inhabitants, coloured and black, are very superior in point of moral character, and exhibit industrious habits. Nearly the whole of the foreign commerce of the country is conducted by foreign merchants, as the credit of the natives is not so generally established either at home or abroad, as to command the confidence of European and North American shippers; but the business of the foreigner is exceedingly limited by the 21st article of the law of patents. The purchasers from the foreigner cannot, under such regulations, be the great body of consumers. An intermediate class is thus created, chiefly, if not exclusively composed of women called “marchandes,” who employ a number of hucksters that traverse the country. The principal articles of import are linens, cotton goods of all kinds, some few woollens, cutlery, iron goods, wines, brandies, provisions (beef, pork, and fish), flour, butter, cheese, lard, candles (chiefly spermaceti), refined sugar, oil, lumber generally, coarse iron goods, earthen ware, tin plates, &c. The staple produce of the country is coffee; besides which there is cotton, logwood, lignumvitæ, mahogany, cigars, tortoise-shell, hides, cocoa, cassia, tobacco, raw sugar, wax, ginger, &c. Nothing conveys such a striking picture of the indolent habits of the people, and of the political distractions which for many years they laboured under, as the deplorable fact that the exports from the island have declined to comparatively nothing since the date of its emancipation from the French and Spanish yoke. Sugar, for example (says Macculloch), since 1789, has fallen off from 141,000,000 to 32,866 lbs.; coffee from about 77,000,000 to little more than 32,000,000 lbs.; cotton from 7,000,000 to 620,000 lbs.; indigo from 758,000 lbs. to nothing; molasses from 26,000 lbs. to nothing, &c. What a comment does this short statement furnish on the comparative value of compulsory and free West India labour! The result is painful to the mind of the philanthropist, as well as the adherent of a generous code of political economy.

LONG BREAKFAST.—A farmer observing his servant a long time at breakfast, said, “John, you make a long breakfast.” “Master,” answered John, “a cheese of this size is not so soon eaten as you would think of.”

HIGHLAND STORIES.

ROBERT ROBERTSON.

ABOUT the beginning of the last century, a party of twelve Camerons made a creach or foray into the lands of Robertson of Struan, and carried off all the cattle upon one particular farm. In the morning when the theft was discovered, Robert Robertson, called *Bane* on account of his fair complexion, who was the son of the farmer, and nearly related to the laird, took his broadsword and target, and though but a stripling, set out instantly in pursuit of the robbers. He came up to them on the top of a hill between Rannoch and Lochaber, and accosting the leader of the Camerons, demanded back his father's cattle. This was of course refused, and the party seemed to ridicule the chivalrous violence of the youth; but Robert challenged their commander to single fight; and as it was not consistent with the Highlander's notions of honour to refuse, the challenge was accepted. Before engaging, the leader desired his men to stand back, and upon no account to interfere, or to use Robertson badly, in case of his gaining the victory. A tough personal combat then ensued, in which it was soon seen that Robbie Bane's youthful ardour was no fit match for the cool practised vigour of his opponent. His strength becoming exhausted, he was on the point of yielding himself, when a slight advantage of ground put it in his power to finish the combat with honour and success. Getting upon a small hillock, which placed him rather above his antagonist, he collected all his remaining strength for one tremendous blow, which, though given at random, fortunately felled the Cameron, and decided the contest in his favour. The reavers were dreadfully incensed at the fall of their leader, and would perhaps have dispatched the victor upon the spot, had not their attention been directed to the recovery of the fallen man. While they were busied about him, young Robertson went to a rivulet to wash his wounds; and while he was stooping down, one of the Camerons levelled a gun at his head, but was prevented from shooting by a companion, who said that they ought at least to delay their vengeance till the fate of their wounded clansman was determined. This was agreed to by all present, and Bane was forthwith seized, and conducted along with the vanquished hero to a bothy in the neighbourhood, where he was seated in the *ben end* upon a seat of turf to await the issue. Cameron was laid out in the other end of the house, and his companions watched anxiously over him. While they were thus engaged, Robert Bane took the opportunity to whisper a girl of the cottage, and desired her to go to Rob Roy, who was then in the neighbourhood, to tell him that a Robertson was in distress (mentioning the name of the place), and that his presence was earnestly entreated. The girl executed her errand with dispatch, and Rob Roy hastening off, entered the cottage with twenty-four followers just as Cameron breathed his last. Rob mingled with the throng, heard the story, expressed some sympathy, and concluded by taking Robertson under his protection, and leading him from the cottage, to the great disappointment of the Camerons, who glared fiercely at their intended victim, though they durst not fall upon him in such company. The gallant Macgregor conducted the young Highlander into Rannoch, the ground of his chief, where he left him, desiring him to present his compliments to the laird, and telling him that he might now consider himself safe from immediate danger, though caution would be required in all his future intercourse with the Camerons. After this, Robertson was engaged in both the rebellions, was the father of a family, and died at a good old age. But so much was his dread of the Camerons, that he never slept without his arms all around his pillow, and never heard a door suddenly open, without drawing his dirk and standing upon the defensive. He could not be suddenly approached without betraying some emotion, and none durst rouse him from his sleep except his wife, so apt would he have been to plunge his weapon in their bosom.

A HIGHLAND FUNERAL.

Highland funerals are usually celebrated with a great deal of festivity. At their late wakes, or watchings of the corpse, many games used to be played; but now decorum has substituted the amusements of dancing and drinking for all other diversions. Two young men once converted to give the company a fright, and it was to be done in the following manner:—One of them secretly contrived to shift the corpse from the bed, and to put himself in its place, with the intention of starting up in sight of the mourners, on the signal of a whistle being given by his companion. All was prepared, and the dance went merrily on for some time, when the young man, judging it time to give the signal, whistled softly towards the bed upon which the supposed dead body was extended. To his surprise, his companion did not start up as he expected. Again he whistled, and no notice was taken of his signal. He whistled yet louder, and again and again, and in the extremity of the moment gave vent to a certain expressive modulation of notes, meant to convey a sense of impatience and alarm, and which has since been converted into a regular and well-known tune. But his companion was still silent, and apparently without motion. He at last went up to the bed, and threw down the clothes, when he found his friend as cold as the corpse which he had meant to represent. He was actually dead.

If this event was brought about through the influence of a peculiar state of feeling, arising from his situation, how mysteriously horrible must that feeling have been!

SCOTLAND IN 1661.

[Extracted from Ray's Itineraries.]

AUGUST the 17th, we travelled to Dunbar, a town noted for the fight between the English and Scots. The Scots generally (that is, the poorer sort) wear, the men blue bonnets on their heads, and some russet; the women only white linen, which hangs down their backs as if a napkin were pinned about them. When they go abroad, none of them wear hats, but a party-coloured blanket, which they call a plaid, over their heads and shoulders. The women generally to us seemed none of the handsomest. They are not very cleanly in their houses, and but sluttish in dressing their meat. Their way of washing linen is to tuck up their coats, and tread them with their feet in a tub. They have a custom to make up the fronts of their houses, even in their principal towns, with fir boards, nailed one over another, in which are often made many round holes or windows, to put out their heads. In the best Scottish houses, even the king's palaces, the windows are not glazed throughout, but the upper part only; the lower have two wooden shuts or folds, to open at pleasure, and admit the fresh air. The Scots cannot endure to hear their country or countrymen spoken against. They have neither good bread, cheese, or drink; they cannot make them, nor will they learn. Their butter is very indifferent, and one would wonder how they could contrive to make it so bad. They use much pottage made of coal-wort, which they call *keal*, sometimes broth of decocted barley. The ordinary country houses are pitiful cots, built of stone, and covered with turves, having in them but one room, many of them no chimneys, the windows very small holes, not glazed. In the most stately and fashionable houses in great towns, instead of ceiling they cover the chambers with fir boards, nailed on the roof withinside. They have rarely any *bellows* or *warming pans*. It is the manner in some places there to lay on but one sheet as large as two, turned up from the feet upwards. The ground in the valleys and plains bears good corn, but especially *beer*—*barley* or *bigge*, and *oats*, but rarely *wheat* and *rye*. We observed little or no fallow grounds in Scotland; some layed ground we saw, which they manured from sea wreck. The people seem to be very lazy, at least the men, and may be frequently observed to plow in their cloaks. It is the fashion of them to wear cloaks when they go abroad, but especially on *Sundays*. They lay out most of their money in cloaths, and a fellow that hath scarce ten groats besides to help himself with, you shall see come out of his smoky cottage clad like a gentleman. There hath formerly been a strong castle at Dunbar, built on a rock upon the sea, but it is now quite ruined and fallen down. Yearly, about this time, there is a great confluence of people at Dunbar to the *herring-fishing*; they told us sometimes to the number of 40,000 persons; but we did not see how so small a town could contain, indeed give shelter to, such a multitude.

August the 19th.—We went to Leith, keeping all along on the side of the *Fryth*. By the way we viewed Tantallon Castle, and passed over to the Basse Island, where we saw on the rocks innumerable of the soland geese. The old ones are all over white, excepting the pinion or hind feathers of their wings, which are black. The upper part of the head and neck, in those that are old, is of a yellowish-dun colour. They lay but one egg a-piece, which is white, and not very large. They are very bold, and sit in great multitudes till one comes close up to them, because they are not wont to be scared or disturbed. The young ones are esteemed a choice dish in Scotland, and sold very dear (1s. 8d. plucked.) We eat of them at Dunbar. They are in bigness little inferior to an ordinary goose. The young one is upon the back black, and speckled with little white spots, under the breast and belly grey. The beak is sharp pointed, the mouth very wide and large, the tongue very small, the eyes great, the foot hath four toes webbed together. It feeds upon mackrell and herring, and the flesh of the young one smells and tastes strong of these fish.

We saw few of the scout's eggs, which are very large and speckled. It is very dangerous to climb the rocks for the young of these fowls; and seldom a year passeth but one or other of the climbers fall down and lose their lives, as did one not long before our being there. The *Laird of this Island* makes a great profit yearly of the soland geese taken; I remember they told us L.130 sterling. There is in the isle a small house, which they call a castle; it is inaccessible and impregnable, but of no great consideration in a war, there being no harbour, nor any thing like it. The island will afford grass enough to keep thirty sheep. They make strangers that come to visit it burgesses of the Basse, by giving them to drink of the water of the well which springs near the top of the rock, and a flower out of the garden thereby. The island is nought else but a rock, and stands off the land near a mile; at Dunbar you would not guess it above a mile distant, though it be thence at least five. We found growing in the island, in great plenty, *beta marina*, *lychnis marina nostra*, *malva arborea marina nostra*, and *cochlearia rotundifolia*. By the way, also, we saw glasses made of kelp and sand mixed together, and

calced in an oven. The crucibles which contained the melted glass, they told us, were made of tobacco-pipe clay.

At Leith we saw one of those citadels built by the Protector, one of the best fortifications that ever we beheld, passing fair and sumptuous. There are three forts advanced above the rest, and two platforms. The works round about are faced with freestone towards the ditch, and are almost as high as the highest building within, and withal thick and substantial. Below are very pleasant, convenient, and well-built houses for the governor, officers, and soldiers, and for magazines and stores; there is also a good capacious chapel, the piazza, or void space within, as large as Trinity College (in Cambridge) great court. This is one of the four forts. The other three are at St Johnston's, Inverness, and Ayr—the building of each of which (as we are credibly informed) cost above L.100,000 sterling; indeed I do not see how it could cost less. In England it would have cost much more.

August the 21st, we went on northward as far as Stirling, 24 miles. By the way we saw the king's palace at Linlithgow, built in the manner of a castle; a very good house, as houses go in Scotland. There is a small lough or standing water on two sides of the house. This lough formerly was never without swans! but Mr Stuart, one of the bailiffs of the town, told us a strange story of those swans which left the lake when the house was taken and garrisoned by the English; and although they were brought on purpose for trial, yet would they not stay there; but at the time of the king's coming to London, two swans, *nescio unde sponte et instinctu proprio*, came hither, and there still continue.

Dumfries.—Here, as at Dunbar and other places, we observed the manner of their burials, which is this:—when any one dies, the sexton or bellman goeth about the streets, with a small bell in his hand, which he tinketh all along as he goeth, and now and then he makes a stand, and proclaims who is dead, and invites the people to come to the funeral at such an hour. The people and minister many times accompany the corpse to the grave at the time appointed, with the bell before them, where there is nothing said, but only the corpse laid in. The minister there, in the public worship, doth not shift places out of the desk into the pulpit. They commonly begin their worship with a psalm before the minister comes in, who, after the psalm is finished, prayeth, and then reads and expounds in some places, in some not; then another psalm is sung, and after that their minister prays again, and preacheth as in England. Before sermon, commonly, the officers of the town stand at the church-yard gate with a joined stool and a dish, to gather the alms of all that come to church. The people here frequent their churches much better than in England, and have their ministers in more esteem and veneration. They seem to perform their devotions with much alacrity. There are few or no sectaries or opinionists among them; they are much addicted to their church government, excepting the gentry, who love liberty, and care not to be so strictly tied down. The country abounds with poor people and beggars. Their money they reckon after the French manner. A *bodel* (which is the sixth part of our penny) they call *tway pennies*, that is with them twopence; so that upon this ground, twelve pennies, or a shilling Scotch (that is, six bodels), is a penny sterling. The Scotch piece marked with XX, which we are wont to call a Scotch two-pence, is twenty-pence Scotch, that is, two-pence sterling, wanting two bodels, or four pennies Scotch; the piece with XL is four-pence sterling, four bodels; and so one shilling sterling is twelve shillings Scotch. Thirteen-pence halfpenny English, a marc Scotch. One pound Scotch, twenty-pence sterling. One bodel they call *tway pennies* (as above); two bodels, a plack; three bodels, a bawbee; four bodels, eight pennies; six bodels, one shilling Scotch.

ADULTERATED FLOUR.

When you are about to try the quality of flour, proceed as follows:—Grasp a handful, give it a sharp squeeze, and set the lump on the table. If it holds together and preserves the form of the cavity of the hand, the flour is good; but if the lump soon falls down, the flour is adulterated. When the adulterant is ground bones, or plaster of Paris, the lump of flour falls down immediately; but when whiting or pipe-clay is present, the lump keeps its form a little longer. The presence of much bran is detected by the colour and feel of the flour; but in this case also the grasped specimen soon crumbles. Genuine flour retains the fine impressions of the grains of the skin much longer than any which is adulterated. Rub a little of the flour between the palms of your hands when they are moist; if you find any resistance, the flour contains whiting. Moisten the fore-finger and thumb with a little sweet oil, and rub a small quantity of the flour between them. If the flour is pure, you may rub it for any length of time without its becoming sticky and adhesive; the flour in the meantime becomes nearly black. But if whiting be present, the flour will soon be worked up into the consistency of putty, which will retain the original white colour, or nearly so. Mix a little flour with water in a tumbler, then drop a little numatic acid into the water. If any chalk or whiting be present, an effervescence will be produced by the discharge of carbonic acid gas.—*Domes-tic Chemist.*

THE COURT OF EGYPT.

Two or three miles from Cairo, approached by an avenue of sycamores, is Shubra, a favourite residence of the Pacha of Egypt. The palace on the banks of the Nile is not remarkable for its size or splendour, but the gardens are extensive and beautiful, and adorned by a kiosk, which is one of the most elegant and fanciful creations I can remember.

Emerging from fragrant bowers of orange trees, you suddenly perceive before you tall and glittering gates rising from a noble range of marble steps. These you ascend, and, entering, find yourself in a large quadrangular colonnade of white marble, which surrounds a small lake, studded by three or four gaudy barques, fastened to the land by silken cords. The colonnade terminates towards the water by a very noble marble balustrade, the top of which is covered with groups of various kinds of fish in high relief. At each angle of the colonnade the balustrade gives way to a flight of steps, which are guarded by crocodiles of immense size, admirably sculptured, and all in white marble. On the farther side, the colonnade opens into a great number of very brilliant banqueting-rooms, which you enter by withdrawing curtains of scarlet cloth, a colour vividly contrasting with the white-shining marble of which the kiosk is formed. It is a favourite diversion of the Pacha himself to row some favourite Circassians in one of the barques, and to overset his precious freight in the midst of the lake. As his highness piques himself upon wearing a caftan of calico and an exterior robe of coarse cloth, a ducking has not for him the same terrors it would offer to a less eccentric Osmanlee. The fair Circassians, shrieking with their streaming hair and dripping finery—the Nubians rushing to their aid, plunging into the water from the balustrade, or dashing down the marble steps—all this forms an agreeable relaxation, after the labours of the divan.

The splendour of the Egyptian Night is realised in the court of Egypt. The guard of Nubians, with their black glossy countenances, clothed in scarlet and gold, waving their glittering Damascus sabres, and gently bounding on their snow-white steeds, is, perhaps, the most picturesque corps in the world. The numerous harem, the crowds of civil functionaries, and military and naval officers, in their embroidered Nizam uniforms, the vast number of pages and pipe-bearers, and other inferior but richly attired attendants, the splendid military bands, for which his sheet. All has an absolute passion, the beautiful Arabian horses and high-bred dromedaries, altogether form a blending of splendour and luxury which easily recall the golden days of Bagdad, and its romantic caliph.

Yet this court is never seen to greater advantage than in the delicious summer palace in the gardens of Shubra. During the festival of the Bairam, the Pacha orders his whole household to be seated on the lawn, and the court is then a scene of the most brilliant scene. The banqueting-rooms were all open and illuminated, the colonnade full of guests in gorgeous groups, some standing and conversing, some seated on small Persian carpets, smoking pipes beyond all price, and some young grandees lounging in their crimson shawls and scarlet vests over the white balustrade, and flinging their glowing shadow over the moonlit water—from every quarter bursts of melody, and each moment the river breeze brought gusts of perfume on its odorous wings.—*New Monthly Magazine.*

MENDICITY IN ANCIENT TIMES.

In every age and country there has existed a large class of persons dependent upon others for the means of subsistence. This is a necessary consequence of the state of society, and, to a certain extent, is requisite to its existence, although, if carried too far, it becomes dangerous and hurtful. Among the Greeks and Romans, and in the ancient world generally, a great mass of the population was in a state of slavery; but it was at the same time sure of being clothed, fed, and, in general, well treated. Those who were not in a state of slavery were supported by government; and when misery was likely to increase from any unexpected calamity, public works were undertaken to give them employment. It is to this cause that Pliny attributes the construction of the Pyramids of Egypt. Herodotus says, that in that country there were judges of police in each canton, whose business it was to receive, from time to time, from the inhabitants, a report of their professions, their means of subsistence, and the condition of their families. The idle were punished as dangerous to the state. Solon, in like manner, made idleness synonymous with infamy, and ordered the Areopagus to inquire how individuals gained a livelihood. All were allowed to exercise some trade; and he who did not bring up his son to a profession, was deprived of his reciprocal claim for assistance in his old age. In Rome during the republic, and at the period of its highest glory, begging was unknown; and one of the principal duties of the censors was, to make diligent inquiry into the manner in which the citizens lived. As the republic sunk into the empire, and as the empire degenerated from power to weakness, and the strict regulations of ancient Rome were forgotten; idleness and debauchery took the place of activity and virtue, and in a short time beggary was established almost as a profession. The *Dolce Farniente*, so well known among the modern Italians, began to form the enjoyment of the poor as well as the rich. The primitive Christians, supposing they were following the model of their Divine Master, recommended poverty and contemplation as the surest means of pleasing the Divinity. But this poverty and contemplation, at first conscientiously practised, soon degenerated into beggary and idleness; and, in the reign of Constantine, the number of beggars (for they deserved no other name) professing the religion of Christ, had multiplied so as to be almost a scourge to the state. This prince, in his anxiety to check the increase of so dangerous an evil, and, at the same time, to insure assistance and relief to the votaries of a religion which he himself had embraced, constructed various hospitals to receive and maintain them; but these were of little avail, as the persons for whom they were designed preferred to wander through the country. The number of paupers increased as Europe became sunk in the darkness of the middle ages, and it was not diminished by the liberal donations which were so common. It became a sort of duty to heaven to succour the poor and indigent. The church of Rome forcibly recommended the plentiful distribution of alms; and, whilst the abuses and bigotry of that church cannot be palliated, it must be allowed that it never failed in charity to the dependent classes of society. In fact, the only establishments of the time which merited the character of magnificence, were founded, in a great measure, for the relief of the poor; and the many religious houses which were so splendidly endowed, served, in many respects, as hospitals and asylums, to which the indigent flocked for assistance. In the early periods of the French monarchy, there was no lack of charitable bounty. Clovis II., who reigned in 638, dissipated all his father's wealth in feeding the poor during a year of scarcity, and

in founding, on the instigation of St Lardry, Bishop of Paris, the Hotel Dieu of that city. Charlemagne was no less attentive to the condition of his poorer subjects; but he was more enlightened in the manner in which he displayed his charity. He published an ordinance, enforcing the necessity of each *seigneur* and *abbé* providing for the maintenance of the poor of his own territory, and preventing them from wandering over the country as beggars. He further authorised all private persons, who should detect individuals begging under the pretence of feigned infirmities, to seize them, and reduce them to servitude. But great events soon succeeded in the history of France. The irruption of the Saracens, and subsequently the spirit of the Crusades, occupied the minds of men to the exclusion of every thing else; and the legislature, in consequence, being engrossed with more critical and important matters, the number of the idle and indigent increased in the absence of any attempts to repress them.*

THE TRUE POET.

THE child of impulse and passion, yet retaining all the simplicity and easy confiding faith of childhood; impatient, impetuous, and full of life, with the blood ever running races through his veins, yet ever under the guidance of reason—not cold and pale as she is wont to be painted, but wise with an earnest wisdom, and warm with the glow and freshness of an earlier clime;—he must be skilled in human nature, and not only must he be familiar with the spoken word and the visible act, but with that philosophy according to which these are regulated. He must ponder deeply the motives of the heart, and be able, by a quick and divining sympathy, to penetrate into its very retirements. He must cherish his imagination, and cultivate his taste, by a careful study of all those whose works give evidence that they felt within them the strivings of the diviner mind; not to imitate, but to gain directions which may guide him to those guarded and enchanted fountains of inspiration from whence they themselves have drawn. He must be learned in all the branches of human knowledge, that his mind may be full of associations. He must become master of the most copious vocabulary, that *copia verborum*, not less important to the poet than the orator; and not only take pains to acquire command of words, but he must study into their powers, and busy himself in learning all those reflected shades and hues of meaning, with which they have been tinged by association, as if they had been dipt “in the warm flush of a rainy sunset:” for this is the distinguishing peculiarity of a poetic dialect, that its words not only suggest the single and immediate idea to the mind, but come linked with a thousand beautiful, though dim, remembrances. But his most anxious labour ought to be to cultivate his own heart—to cleanse it from all the taints which it acquires by coming in contact with the world. He must strive earnestly to purify his imagination: to fill his mind with noble desires and motives; to divest himself of every selfish, local, or party prejudice; to become, in truth and in deed, a citizen of the world; to ennoble and expand his heart till it become a great sea, which shall gather tribute from the fountains of the whole earth, to purify and again give back their contributions in the shower and the fruitful dew. He must strive to make himself perfect in all good, wise, and great things, and to become a living example of that perfection upon which his soul's eye should be for ever fixed. Thus educated, those restless yearnings of the spirit, those unquenchable desires, ever thirsting for satisfaction, yet never satisfied, which form the real moving power that impels the true poet forward, will be left free to act; and those high instincts “haunting the eternal mind, a presence that will not be put by,” will find for themselves a tongue and a ready utterance.—*North American Review.*

THE PRESENT STATE OF HUNGARY.

THE Hungarian nation, ancient and picturesque, and peculiarly characterised as it is, appears to be at present little known, and perhaps still less cared for, in England. Our indifference is singularly ungrateful; for there is scarcely an European country in which the Anglo-mania rages more fiercely than in that slighted land.

The Hungarians are fond of attempting to prove a national resemblance between themselves and the English; although, as a wreck of absenteeism, Ireland might surely afford them a closer parallel: but all who are acquainted with the *morgue* and presumption of the Magyar character, can appreciate the compliment intended by the expression of such an opinion. The English language has been of late years extensively cultivated among the higher classes; and the names of our popular writers and artists have become familiar in their mouths as household words. The portraits of Scott and Byron, and engravings after the works of Wilkie and Harlowe, are among their most common domestic ornaments. I should, however, be understood to allude simply to the inhabitants of their chief cities—of Presburg, Pesth, Ofen, or Caschau; for the provinces still remain in the lowest state of mental and moral degradation.

At the university of Pesth, there is a professorial chair for the English language, with a liberal endowment. It is at present filled by an intelligent Frenchman—a soldier of Napoleon's army, who has compiled in Latin, for the use of the students, an English Grammar, Dictionary, and other class-books, which have been honoured with the commendation of the critics of Gottingen. The works first placed in the hands of the scholars of Pesth, are the Vicar of Wakefield and Shakspeare's Comedies! But the writings of Scott, Byron, and Moore, with some of our best periodicals, are in extensive circulation.

Nor are our manufactures less appreciated. I noticed that *dobinée*, or English bobbinet, was lavishly distributed

upon the dresses of the recent carnival; and that the price of five hundred florins, *mon*, or fifty guineas, was affixed to a set of Staffordshire crockery in a warehouse in Buda; while the most beautiful Vienna porcelain was valued at a third of the sum. The sign of “the English Lord” adorns several distinguished tailors' shops in the capital—typified by the effigy of “a fine, gay, bold-faced villain,” in top boots, a hunting frock, and a brown beaver, or in an imitation of Werther's costume.

I venture to record these unimportant circumstances, to show that, while our sole or chief acquaintance with Hungary is derived from Dr Bright's excellent volume, there is scarcely an event of English life—a folly of London fashion—or an invention of British industry, which does not find admirers, and commentators, and imitators, among the Hungarians of respectable degree.

Since the publication of the work to which I have alluded, fourteen years of peace and tranquillity have done much towards the amelioration and advancement of a nation, which can scarcely claim more than to be considered as a connecting link between the barbaresque and civilised Europe. Pesth—the modern capital—is extending its Regent Streets and Waterloo Places along the banks of the Danube, and requires only a permanent bridge, to form, in its union with Buda, one of the finest cities of the Austrian States; a city exhibiting, in the ancient walls of Ofen, the dignity of historical interest; and in the opulence and activity of her modern rival, a cheering instance of commercial prosperity. It seems probable, indeed, that should some change occur in the policy of the Austrian cabinet, Hungary, with an amended constitution, may claim that place among the nations of Europe from which she has been so long degraded. Were I to describe more fully the condition of this unhappy land, and the oppression by which it is daily polluted, I might create feelings of very painful interest in its favour; but I am aware that my limited acquaintance with the language of the people, and my ignorance of the classic tongue far more familiarly in use among them, might betray me into exaggeration.—*Hungarian Tales.*

THE DROP OF DEW.

BY ANDREW MARVELL.

See how the orient dew,
Shed from the bosom of the morn,
Into the blowing roses,
Yet careless of its mansion new,
For the clear region where 'twas born,
Round in itself incloses:
And in its little globe's extent,
Frames as it can its native element.
How it the purple flower does slight!
Scarce touching where it lies;
But gazing back upon the skies,
Shines with a mournful light,
Like its own tear,
Because so long divided from the sphere.
Restless it rolls and insecure,
Trembling lest it grow impure,
Till the warm sun pities its pain,
And to the skies exhales it back again.

So the soul, that drop, that ray
Of the clear fountain of eternal day,
Could it within the human flower be seen,
Remembering still its former height,
Shuns the sweet leaves and blossoms green;
And recollecting its own light,
Does in its pure and circling thoughts express
The greater heaven in an heaven less.
In how coy a figure wound,
Every way it turns away;
So the world excluding round,
Yet receiving in the day;
Dark beneath but bright above,
Here disdaining, there in love;
How loose and easy hence to go;
How girt and ready to ascend;
Moving but on a point below,
It all about does upwards bend.
Such did the manna's sacred dew distil,
White and entire although congeal'd and chill;
Congeal'd on earth; but does dissolving run
Into the glories of the Almighty sun.

FLORENCE.

WHILE the eye rests on this far-famed and beautiful city, its magnificent edifices, fine architecture, and antique buildings, rising in dark and imposing majesty, its bridges and its noble river, watering, far as the eye can reach, the vale of the lovely Arno, the mind insensibly wanders back, and recalls the days when turbulence and bloody feuds raged within the walls; when, on the surrounding amphitheatre of hills, now luxuriant with the olive and vine, and richly studded with peaceful dwellings, stood, proudly frowning, the castellated towers of the feudal chief, at once the terror and protection to the city. Of these towers scarcely a trace remains. The architecture of Florence is grand and gloomy beyond that of all other cities in Italy. Were these singular buildings displayed by greater breadth of street, or if these imposing fabrics could be translated to other cities, the vast and magnificent character which distinguishes the Tuscan style would then be seen. To this hour Florence bears the aspect of a city filled with nobles and their domestics—a city of bridges, churches, and palaces. Every building has a superb and architectural form; the streets are short, narrow, and angular, and each angle presents an architectural view, fit to be drawn for a scene in a theatre; each house is a palace, and a palace in Florence

* From a General Medical and Statistical History of the Present Condition of Public Charity in France. By D. Johnston, M.D.

is a magnificent pile, of a square and bulky form, of a grand and gloomy aspect, with a plain front, extending from two to three hundred feet, built of huge dark grey stone, each measuring three or four feet. A coarse rubble work rises in a solid form to twenty or thirty feet in height. A great grooved stone, or sylabate, sets off the building from the street, forming a seat which runs the whole length of the front, and which, in feudal times, was occupied by the dependents of the family, who there, loitering in the sultry hours of the day, lay asleep under the shelter of the broad deep cornice, which, projecting from the roof, threw a deep shade below. The immense stones of this coarse front bear huge iron rings in capacious circles, in which sometimes were planted the banners of the family; at others, they were filled with enormous torches, which, in times of rejoicing, burned and glared, throwing a lengthened mass of lights along the walls. Not unfrequently merchandise was displayed drawn through these rings, and sometimes also they served for tying up the horses of the guests. The first range of windows, which are ten feet from the ground, are grated and barred with massive frames of iron, resembling those of a prison, and producing an effect singularly sombre and melancholy. The front of this building has, on the second floor, styled piano nobile, a plain and simple architrave. The windows are high and arched, placed at a considerable distance from each other, and are ten or fifteen in number, according to the extent of the front. They were often so high from the floor within, that in turbulent times, when the house was itself a fortress, the besieged, leaping up three or four steps to the window, would from thence view and annoy the enemy. The third story is like the second in plainness and in the size of the windows. The roof is of a flat form, with a deep cornice and bold projecting soffits, which gives a grand, square, and magnificent effect to the whole edifice. The chimneys are grouped into stacks, the tops of which, increasing in bulk as they rise in height, resemble a crown: the slates with which they are constructed are placed in such a manner as to produce the effect of ventilation, having a pitted form, resembling the fan heads of the inside of a mushroom. This gives a rich and finished aspect to the most trivial or most undignified part of the building. Immense leaden spouts, that project three or four feet, collect the waters which, in the great rains of these countries, fall with extreme violence, descending with the rush and noise of torrents from the roof. Two or three long flat steps lead to the porch of the palace, and the entrance is by a high arched massive iron gate, the doors of which are cross-barred, studded with iron and bronze nails, and the ornaments of the panels are richly covered and embossed. The effect of these gates is very splendid. They open into a cortile or court, the base of which is encircled by a high arched colonnade, supported by marble columns. Beautiful gardens often adjoin the palace, and through a corresponding gate or iron railings the eye rests on the luxuriant verdure of rich foliage. It was under these arcades, shaded from the noontide, and cooled by the waters of the fountain which occupy the centre of the court, that the rich merchandise of the east, the silks, and shawls, and fine linen, and all the valuable manufactures of Tuscany, lay spread out, as in a place of exchange; while under vast arched and vaulted chambers was stored the wealth which was there brought for sale. Entering from this court, a great staircase leads to a suite of noble chambers, halls, and saloons, hung with silks and richly adorned. The lofty ceilings are finely painted; the beams are always displayed, but are carved, ornamented, and gilded, so as to form a splendid part of the whole. The arcades of the court support the galleries, which, in former times, were generally filled with fine paintings, statues, vases, and precious relics of antiquity. In such palaces, the rulers, the magistrate, the noble, and the merchant, dined, surrounded by their family and adherents. The manner of the times bore a character of manly simplicity, which singularly contrasted with the splendour of the rich possessions, and the importance of their political sway among nations.—*Bell's Italy.*

ANECDOTES.

On Burns's first appearance in Edinburgh he was introduced, among many others, to Mr Taylor, the overweening parochial schoolmaster of Currie, who was also a competitor in verse-making, and whose opinion of his own merits far overbalanced what little estimation he might have formed of the plain unlettered peasant of Ayrshire, whose name was as yet new to the public. Mr H—, at whose table Burns was a frequent guest, invited Taylor one day to dine with them, when the evening was spent with the usual good humour and jocularities. Taylor had brought his manuscript poems, a few of which were read to Burns, for his favourable opinion previous to printing. Some of the passages were odd enough, such as,

"Rin, little bookie, round the world doup,
Whilst I in grave do lie wi' a cauld doup,"

at which Burns laughed exceedingly. Notwithstanding the pedantic and absurd perversity of the poems, he gave him a commendatory line to the printer. Next morning Mr H— meeting Taylor, inquired of him what he thought of the Ayrshire poet. "Hoat,"

quoth the self-admiring pedagogue, "the lad'll do—considering his want o' lear, the lad's weel enough."

An appreciation of self over the superior accomplishments of others, is not confined to the schoolmaster of Currie, as the two following anecdotes here printed for the first time will show:—Commodore Elliot, who distinguished himself so much by capturing Thurot, was one day crossing the Frith of Forth in a Kinghorn pinnace, and, for want of any thing better to amuse himself with, he asked permission to steer the vessel. "Gad, sir!" said the commodore, when he used to relate the anecdote, "I thought myself a good steersman. I had taken the helm of my own vessel when chasing Thurot. It did not appear, however, that my qualifications made a great impression upon the master of this boat; for, soon after, I heard him say to his son (a lurching boy), 'Jock, tak the helm out o' that man's hand, for he canna steer nane.'"

Formerly an old man used to excite the commiseration of the passengers between Leith and Edinburgh, by his screeching performance on a wretched clarinet. One day a distinguished clarinet player, who had been brought down from London for a kind of musical festival, happened to come within hearing of this poor old man. He went up, and, begging a loan of the instrument, fitted on a new mouth-piece, and played a tune in his usual brilliant style. The friend of the performer then asked the old man what he thought of it. "Oh, if he practises," said the mendicant, "he'll aiblins come on."

REVENGE.

A person being asked why he had given his daughter in marriage to a man with whom he was at enmity, answered, "I did it out of pure revenge."

OLD BURGH LAWS.

THERE is an old work, called "QUONIAM ATTACHIAMENTA" (because these are the first two words in the Latin copy), which contains all the laws for regulating society in our royal burghs, about the time of Robert Bruce, and his immediate successors. Many of these laws cast a very steady light upon the state of Scotland at that time, so far as the mercantile part of the community was concerned; and we therefore think it may be worth while to present a few extracts to our readers, so that they may form a judgment as to the comparative comforts of that and the present age.

Whenever a burghess in those days died, his heir-at-law could claim certain of his goods and chattels, whatever might be the directions of the testament. From the list of articles which could be so claimed, we arrive at a tolerably distinct idea of the furniture of a burghess's house at that period. Mention is made of "the best boord [table], ane boord-claith, ane towell, ane bassin, ane lawer, the principall bed with the sheits, and the rest of the claiths pertaining to ane bed, ane feather bed, the best leid, with the masking-fatt, ane gyll-fatt, ane barrill, ane gallon, ane kettill, ane caldrick, ane posnett, ane bag to put money in, ane calcrunk, ane chimney, ane water-pot, ane kist, ane kuke, ane pleugh, ane wane, ane cart, ane charit, the greatest brassen pot, and ane littell pot and pan, ane roasting-iron, ane girdill, ane mortar, ane pastell, ane dish, ane dibler, ane charger, ane cuppie; gif there be twelve or mae spunes, the heire shall have twelve; gif there be bot twelve, or fewer, he sould have bot ane; he shall also have ane steele, ane furnse, ane flail, the weyes, with the wichts, ane spaid, and ane aix."†

From the forms of challenge for the Chamberlain air, a kind of convention of burghs held at Edinburgh, it appears that a shameful degree of turpitude and faithlessness pervaded almost every portion of the community, and that the laws were completely disregarded even by their proper ministers; as, had not such been the case, the Chamberlain could never have supposed it possible for men to commit such flagrant acts of impropriety as the following:—The taster of all "sa filled his belly in the time of tasting," that he lost the very taste of his mouth, and could not give a discreet opinion of the liquor submitted to his judgment. The feshers sold their meat in secret places, and not in their open booths. The baxters did not make their bread in loaves agreeable to the money of the realm, as "bread for ane pennie, bread for ane halfpennie, and bread for ane farthing;" neither did

they make all the kinds of bread required by law, as "ane fadge, symmel, wastell, pure clean breade, mixed bread, and bread of trayt." The millers occupied a greater space betwixt the "happer and the millstane for their awin profite than the law permitted; which was nae mair space nor ane sommer wand of ane hazel tree." But the souters were the greatest rogues of all. They "made shoon, boots, and other graith, before the hides were barkit;" and they never scrupled to sew their goods with "false rotten threid, throu the quihlik the shoon are tint before they are half worne." These consummate rascals, also, "did not give their leather gude oil and tauch [tallow], but water and salt!" The enormities of the tailleurs seem to have been nothing more than those alleged so oft against their descendants; for they were constantly making "over mickle refuse and skaiths in men's claiht," and "took pieces and shreds, and other small things."

Great anxiety is expressed in the burgh laws, that persons having goods to sell should not conceal the fact, but expose them fairly in open booths. Fleshers are ordered to put their flesh "into their open windows." Brewster wives are threatened with a fine of four pennies if they do not "put furth ane cyne of their aill, without the house, by the window or by the dure, so that it may be seen as common to all men." Bakers are commanded, also, to expose their bread either in their windows or in the market-place—"not to hide it, otherwise they shall pay a fyne of eight shillings." All persons, in general, dealing in the necessities of life within the burgh, are commanded to sell to all people, strangers as well as indwellers, and never to withhold any articles for their own use, if otherwise required, above the value of four pennies. It may seem strange that traders should have long ago required such a command—every man being now as anxious to sell as any mortal can possibly be to buy. The circumstances of the country must be considered for the true explanation of the mystery. In those early times, when the system of communication was so imperfect, it might sometimes be difficult to procure supplies of goods, and in the case of their being only one dealer of a particular article in a town, he would feel himself under no necessity of being civil to his customers—might even affect to sell his goods rather by way of favour than according to the modern ideas of merchants.

The trade of the baker was in those days very important; and the inquirer into the early history of our trade corporations is constantly puzzled to account for the great numbers of this craft, which seems so irreconcilable with the recently universal practice, among even the middle ranks, of baking coarse barley and oatmeal bread for family use. In the early times we are referring to, the people must have had ovens in many cases wherein to bake their own bread; for it is statuted that no man have such an oven unless he be a king's burghess. It also appears to have been customary for a person to keep an oven for the use of his neighbours. Such an establishment was attended by four servants, each of whom had a small fee from every one who used it.

The price of goods was in those days a matter of state regulation—not, we are persuaded, from a disposition to embarrass trade or tyrannise over the mercantile classes, but simply as a *dernier resort* to protect the people at large from imposition. The price of mutton, for instance, was to be nineteen pennies for the whole carcass from Whitsunday till the feast of St James, ten pennies from that till Michaelmas, and one penny from Michaelmas till Pasch [Easter]. Brewster wives were restricted to sell their ale at two pennies per gallon between Pasch and Michaelmas, and one penny from Michaelmas till Pasch. This useful class of persons are enjoined to brew according to the consuetude of the burgh, otherwise they shall be suspended from their office of brewing. "And gif she makes gude ail, that is sufficient. But gif she makes evill ail, she shall pay an unlaw of aucht shillings," and be set on "the cock-stule." "The like is to be understood of mead as of evill ail."

It was not allowable in those days for any body to travel during the night, except to bring a priest to a sick man, to carry corn to the mill, or to pursue stolen goods; and even in these cases it was necessary for the person travelling to make himself known to his neighbours before going away, and to the inhabitants of the towns through which he passed. No person was permitted to harbour a stranger longer than a night, unless he gave a pledge for him. All of these are sure signs of the insecurity of the times.

To conclude this picture of the wisdom and comfort of our ancestors, there was a solemn statute by King David the Second, that if any man kill his neighbour's dog, he "sall walk [watch] or keep his midden for the space of a year and day," thereby compensating for the services of the deceased Argus, and at the same time enduring that pain and trouble due as the punishment of so grave an offence.

EDINBURGH: Published, weekly, by W. and R. CHAMBERS, 19, Waterloo Place; ORR & SMITH, Paternoster-row, London; and GEORGE YOUNG, Dublin. Agent in Glasgow, JOHN MACLEOD, 20, Argyle Street; and sold by all other Booksellers in Great Britain and Ireland.

Subscribers in town may have the paper left at their houses every Saturday morning, by giving their addresses at 19, Waterloo Place. Price of a quarter of twelve weeks, 1s. 6d.; of a half year of twenty-four weeks, 3s.; and of a year, 6s. 6d. In every case payable in advance.

From the Steam-Press of W. and R. CHAMBERS.

† We get an idea of the accoutrements of the Scottish soldiery of Bruce's time, from the statute attributed to him, in the volume entitled the "*Regiam Majestatem*." Every man having ten pounds worth of land was to have for his body, and for defence of the realm, "ane sufficient acton, ane basnet, and ane glove of plate, with ane spear and sword. Quha has not ane acton and basnet, shall have ane gude habergeon, and ane gude ain jak for his body, and ane ain knapskay, and gloves of plate." Every man having the value of a cow in gudes "sall have ane bow with ane schaff of arrows, that is, twenty-four arrows or ane spear."

No. 27.

SATURDAY, AUGUST 4, 1832.

PRICE THREE HALFPENCE.

NOBODY TO BE DESPISED—

—EXCEPT on particular grounds of demerit. This is a maxim which it would be well if the world would pay more attention to.

There are many people—very good people, too—who have a habit of speaking contemptuously or lightly of almost every body but themselves. There are still more who do not seem to consider it necessary to treat the absent with the least respect, but, to use the words of a modern writer, are remarkably candid in owning and showing up the faults of their neighbours.

These, I think, are detestable practices of human nature—the issue of its weakness rather than its strength.

When I think of a great and good character, I cannot conceive that he has a habit of depreciating the respect due to his absent friends, or of treating any of his fellow-creatures with scorn, unless for some specific delinquency. Such a person will be already too secure of his own reputation to seek to raise it at the expense of others. He will be able to take an enlarged view of human society, and, seeing that the condition of all men is in a great measure accidental, or at least moulded greatly by circumstances, will not despise any man on account of his mere place in the general system, but, on the contrary, give him respect in proportion to his good conduct in that place, whatever it may be. Such a man, also, will have too much respect for himself, to use language at any time which he would be ashamed to own at another time. He would not indulge in a tone of levity or rancour respecting any man, on whose entrance accidentally into the room he would have to alter his style, and hypocritically offer him the usual courtesies of society.

It happens, however, that all men are more or less remote from the greatness and goodness of this ideal character. We are, as yet, only in a state of comparative approximation to those qualities; hence we find that nearly all are alike given to speak slightly of each other. There are two grand causes at the bottom of this—Selfishness and Thoughtlessness. The former gives us such an intense appreciation of ourselves, and of the rank we hold in society, that we speak and think as if every man and every class beneath us were too mean to be entitled to the least respect; we look upon the whole as a degraded caste, whose very existence must only be acknowledged indirectly, as a thing we have become acquainted with by seeing it at a distance, not by having ever come in contact with it. In this view of society our ordinary literature is very apt to confirm us. The key-note is there struck always in *alt*. The whole strain of the work, its characters, its philosophy, its manners, are presumed to be something above the common level; for literary men are still, after all, very much the slaves of the great which they used to be. If the writer describes humble life at all, he describes it as seen by a bird's-eye view from some lofty station—not as seen by a person who mingles in it and partakes of its sympathies. Even the middle ranks of the community, who in this country form the great mass of readers, and from which, moreover, almost all literary men arise, have no literature of their own: they have to read a literature which has been calculated for the sphere above them, and in which, of course, their sympathies must be of an imperfect character. And thus, after all that has been done, it still appears a desideratum that there should be both a literature and a philosophy for the human race.

Then, as to *thoughtlessness*, as a cause for this universally mutual contempt. It must be admitted, I should think, that if we only took a proper consideration of the noble destiny which all partake in common

with ourselves, both in respect to the grand moral ends of this life, and the more sublime prospects for the future, we would hardly think meanly of any one, except, as before mentioned, on account of some specific worthlessness. For my part, I wonder how any man can *dare* to despise a fellow-creature upon other grounds. Is it difference of tongue, of rank, of personal character, of external manners, that makes you despise any one? What, I would ask, are all these distinctions to the great fellowship of our common humanity—the social end which we are working to as parts of a great community—as parts of a glorious world—or the general destiny which awaits us at the close of this brief life? Reflect upon these things before you permit yourself to think lightly of a fellow-creature; or, if these things are of no avail with you, consider what you are yourself, that you thus scorn another. I must say that I have often observed the most contemptible man to be the most contemptuous. There are some men who hardly make any other pretension to the respect of the world, than in so far as they profess to treat *every thing* cavalierly. But, as he who sheds blood must submit to have his blood shed by others, so are these men at length detected, and tossed, as they deserve, in a blanket of their own weaving. Individuals may be assured that it is not by proclaiming a war of contempt against the world, or any large number of its members, that a comfortable situation is to be gained for themselves.

There is a good old national proverb, which tells us that the king's errand may come in the pedlar's road—that is to say, a very lofty man may occasionally have to take a favour from one in humble life. This is no mere flattering unctio applied by the common people to themselves. It breathes the very spirit of an enlarged and humane philosophy. It tells us that all ranks of men are in reality dependent upon each other, and that every one, filling its proper place, is entitled to its proportion of regard from the rest. Treating the expression in its more limited sense, it instructs us, that, in the prospect of our being occasionally obliged to accept of favours from very mean hands, we should never treat any person beneath us with disrespect—as, otherwise, with what grace can we accept of such a favour? On this point I take the liberty to relate a simple anecdote, as told to me some years ago, in illustration of the subject of this essay, by the individual chiefly concerned—the wife of a shopkeeper in a country town in the north of Scotland.

"In — there lived a poor woman named Peggy Williamson, a kind of washerwoman, whom every body looked upon as a wretched creature. This despised and not very reputable person had a son, who on one occasion was taken up by the town officers for some trifling offence, and would have been thrown into prison, if I had not thought the case rather a hard one; and interceded with the magistrate in his behalf. Peggy, with all her faults, was not ungrateful; she came to me and said she never would forget my kindness.

"A long time after this, in consequence of a particular calamity, my husband's affairs got into a very hopeless state. I was attending the shop one bleak November day. Few customers were coming in, or likely to come in, and our prospects were gloomy and dull as the atmosphere itself. I never, indeed, since we began business, saw a day when things seemed less promising. The whole street—the whole town—appeared deserted. All was desolate, cold, and wintry; and, with the dread of utter ruin impending over us, you may suppose that our spirits were not very good. Well, just while we were in this dolorous state, in came my old friend Peggy Williamson, accompanied

by a country girl, who, she said, wanted to provide herself with a number of our wares, being about to be married. This person expended six or eight pounds with us, and we could not help feeling it as a kind of God-send. It was, however, the result of my having at one time done a just, for I can hardly call it a kind action, to a person whom the most of people despised. Peggy, who was not perhaps aware of the full extent to which we appreciated her good offices, told me very modestly, as she left the shop with her friend, that she was glad to have had it in her power to recommend any body to us for goods, 'as she never could forget my kindness to Tam.' I thus satisfied myself, not only that an act of ordinary benevolence is likely to produce its reward where it is least expected, but that some good feeling may exist even in those characters, whom, on ordinary principles, we may be most inclined to despise."

Let us judge, then, or at least let us always be inclined to judge, with tenderness, both of persons and of things. Let us not take our impressions of the characters of our fellow-creatures from the little obvious fault or foible which lies upon the surface, and affords, of course, the subject of largest discourse to the superficial, but, dashing aside the weeds which mantle the surface of the character, ascertain the extent and sweetness of the clear water beneath. It is of great importance to men, but especially to young men, to acquire a power of judging correctly and definitely of every thing. They must learn to estimate every thing relatively, and not be prevented from allowing merit, even where it exists in the smallest quantities, by its being mingled with a larger proportion of less worthy qualities. We often find one kind of merit denied because it is not another. A man of untutored genius is sneered at because he wants learning. A learned man is termed a stupid dunce or a pedant because he wants genius. The writer of an unpretending narrative is described by some of his invidious fellows as no Hume, or Gibbon, or Robertson. An industrious tradesman is ridiculed as a mere plodder; a farmer is laughed at because he is only acquainted with country affairs. Glasgow is condemned as deficient in the refined professional and literary classes of inhabitants, who reside in Edinburgh; and Edinburgh is scouted for its being "not at all a place of business." These are vicious habits of thought and speech—if *thought* there can be in what argues a total absence of every thing like reason.

JOCK O' THE HORN.

In former times the beggars of Scotland seem to have held a far higher rank in society than the vulgar vagrants of the present day. Even at the close of the last century, they were rather a respectable sort of persons, and held in no little consideration among the country people; but still their estimation at that late period was nothing compared to their importance about a hundred years ago. Traditions exist of some, who at that time exercised the high functions of occasional minstrels and envoys to great families, after the feudal custom of keeping these officials in regular employment had ceased.

Of the latter class there once arose a mighty hero, who was commonly known under the appellation of Jock o' the Horn. The range of his walk extended over the whole of the south of Scotland, and even so far as the frontiers of the Highlands, where he sometimes associated with the gatherers of black mail, and gave information of the proper objects of attack, and subjects of exaction. He flourished during the period between the two rebellions, and died at an advanced age some years before the middle of the century.

Jock was a tall and powerful man. He usually rode upon a small grey horse, and was equipped in most of the usual accoutrements of a complete cavalier. He did not wear a sword, it is true, but he certainly carried fully as good a weapon, in the shape of a stout dagger, eighteen inches long, which was bound close to his body, under his clothes, by a broad leather belt. If he did not wear a gallant white plume on his hat, like what Sir Walter Scott has represented (in *Rokeby*) as the distinction of the cavalier, he sported a bonnet equally redoubtable, being formed of the dressed skin of the badger, which gave an air of indescribable wildness to a countenance in itself sufficiently fierce. Seated on his ambling palfrey, his proud, erect, and almost noble figure gave him all the appearance of a knight of romance; while the immense horn from which he derived his title, slung below his right arm, at the same time communicated another and still more immediate idea of his pretensions to the character. On approaching the castles of his friends—he was too proud a beggar to enter a cottage—he rode briskly up to the gate, and blew a loud and sonorous blast upon his horn, by way of announcing his arrival. His horse was then abandoned to the attention of the domestics, and himself ushered into the hall with great ceremony, as being a visitor of the utmost consequence. His news could be communicated to no one but the master of the house, or, in case of his absence, to the chief officer of the establishment at least. He always used terms of the most distant respect in addressing his lordly host, and paid infinite attention to every requisite punctilio, when their meeting took place in the presence of the servants; but when his news or his messages were delivered in private, the utmost familiarity prevailed; or Jock, if occasion required it, assumed the tone of a counsellor. In receiving the hospitalities of the castle, and giving his news in exchange, he rather seemed to consider himself the obliging than the obliged party. He sat stiff and pompous upon his chair, giving forth intelligence of the most varied description—while numerous attendants listened around—to all appearance as important a personage as the baron whom he addressed. His information embraced a variety of topics; the recent transactions upon the Highland line; the deaths or marriages of the Scottish nobility, and the fetes thereupon, in which he had mingled; the principal affairs going on abroad, or in the British Cabinet; the exploits of the Ayrshire smugglers; together with an immense miscellaneous budget, resembling in its nature that species of news which afterwards passed in the papers under the general title of “Scottish Intelligence.”

In another capacity he was wont to assume a still higher tone. He was frequently employed by the turbulent gentry of the period as a spy upon the actions of their rival neighbours, or as an ambassador sent to their friends. At that time the laws of Scotland were but weakly enforced, and the baronial rights of pit and gallows still existed, though not so often or so barbarously acted upon as formerly. The nobles were unsettled in their adherence to the government, and still retained many of the feudal enmities which had once filled Scotland with blood and rapine. Of course, rebellion was a subject at all times in agitation; and plots were constantly forming, with views of vengeance upon their neighbours, and of aggrandisement to themselves. Jock o’ the Horn was frequently employed by these as an emissary and spy. Sometimes he was deputed from the Lowlands to the Highlands, in order to sound the feelings of the gentry in that quarter, and again transmitted to the south with assurances of zeal and devotion in the favourite cause. At other times his errand was to take cognisance of the motions and force of the enemy, to get accurate intelligence of the most remarkable public proceedings in the country, and to receive and convey letters and presents smuggled into the coast from a certain quarter abroad. It will be perceived that he must have been a person of no little use at a time when newspapers were hardly known, and when a conventional system of conveying intelligence could scarcely be said to exist.

Jock o’ the Horn was altogether quite a mysterious sort of being. His original was involved in the most impenetrable obscurity: even the place of his nativity was unknown. All that could be discerned with any certainty was, that he must have belonged to Ayrshire, as he spoke the dialect of that county, and seemed always to have a greater attachment to it than to any other district. It was thought that he was the natural son of some nobleman in the county. Others were of opinion that he was a branch of some great cavalier family which had suffered among the civil broils of the preceding century. Certain it is that he was poor enough to substantiate either of the theories. Though he sometimes received considerable guerdons for his services, and no little occasional charity, he never hoarded money, but, on the contrary, spent it merrily, and kept himself in good case.

It appeared, from his conversation, that he was far travelled. He was perfectly intimate with the northern parts of France, with the Netherlands, and with Holland. He seemed to have made French manners his study, and many of his “queerest stories” turned upon that subject. The intercourse, however, which he appeared to have had with France, was common at that time to many of the vagrants of Scotland, of whom there were few who had not seen several foreign countries, and spoke their various languages.

Jock o’ the Horn entertained a sincere hatred and contempt of the Dutch, whose habits were so much at variance with his own.

Jock was a bold intrepid man, and in his time had engaged in many desperate enterprises. In particular, he had once, with some followers, gained a complete victory over a band of gipsies, who were approaching to cross a small river in Galloway. He planted his party in ambush by the side of the way, and kept quiet till the half of the enemy had passed the ford, when, like Wallace at the bridge of Stirling, he rushed out with his band, and attacked the remainder. Some dreadful blows were given, and many severe wounds inflicted on both sides, but no lives were lost. Whenever this affair was mentioned in Jock’s presence, he did not say much himself, but looked with a triumphant smile, as much as to say that he did not like to boast of his exploits, but he was conscious of having done something in his day.

The next most remarkable Ayrshire beggar after Jock o’ the Horn, was one of a less chivalrous but equally interesting character, named CHARLIE BROWN, and commonly known under the name of *Cabbage Charlie*. This man was so noted for cunning, dexterity, and enterprise, that it is probable he was of gipsy extraction; at least it may be said that he exhibited many of the distinguishing characteristics of that race.

The era of *Cabbage Charlie* was some years later than that of *Jock o’ the Horn*. He flourished during the period between the rebellion of 1745 and the year 1770, about which year he was gathered to his fathers.

The most ludicrous peculiarity attending this man was the great propensity he displayed for speculation and adventure. He indeed appeared to be gifted with what may be called a great mercantile genius; and if he had been born amidst a more commercial people, and under different circumstances, it is by no means hypothetical to suppose that he might have “strutted in a bank, and clerkit his cash-account,” or “led a market,” or moved an exchange at a nod, with the best of them. As it was, he certainly did more in his way than could have been expected. Not content with his own simple exertions, he kept a numerous band of beggars in pay, who went abroad as his servants throughout the county, and who, on coming back to the appointed rendezvous at the end of the week, gave up all the proceeds of their industry to him, and received a certain allowance, previously agreed upon, amounting to from ten to fifteen shillings per week. By a talent that might not have disgraced more celebrated names, he contrived to organise and reduce to a perfect system what would appear almost impracticable, considering the habits of those with whom he had to deal. He even found means of detecting the smallest dishonesty on the part of his men; and he acquired such a strange influence over them, that they durst make no remonstrances against the severity of his rules, nor complain of the penalties and taxes to which he sometimes subjected them. Indeed, he was a perfect autocrat among them.

The principles of the system which gave him this absolute command, and induced them to pay implicit obedience, were founded upon a few well-known data, completely calculated to produce non-resistance.

In the first place, the persons whom he employed could make more of their labours by entering his service, than by going upon their own bottom; for it must be understood that the alms given by the country people to the poor consisted chiefly of meal; and as none would take such an article off their hands, except the humblest class of cottagers, who gave them only half price for it, they would have suffered a very considerable loss, had not their master found out an expedient by which he got almost market price, and by which he could afford to allow them greater wages in money than they of themselves could have gained by disposing of their own individual collections. Charlie’s method of selling his meal was to collect and mix the whole contributions of his men, and to make it up into loads and bolls for the regular market. It thus escaped the hateful imputation of being “*beggars’ meal*,” a thing generally abhorred, and only bought, as we have said, by the very poorest people.

At seed-time, too, when alms were frequently given in the shape of corn, Charlie found a method of selling the stock, more profitable to all parties, by disposing of it in bolls to stablers, &c.; a method more profitable, we say, than if his men had gone with it in smaller quantities to ostlers, when, though it might not be objected to on the same plea of delicacy which lessened the value of their meal, they would have been obliged to be content with a diminished price, and at the same time would have been led into treating the ostler and his insatiable myrmidons with as much as they could drink.

In every respect, indeed, did Charlie’s deputies find it their interest to keep on good terms with him. After they had once enlisted under his banner, he had them completely in his power. If they misbehaved, or grew lazy, or became inattentive to business, he had it in his power to discharge them; and if they were discharged from Charlie’s employ, there was no more good to be expected of them in this world. They in a manner lost *oaste*—they forfeited the esteem of the country! He contrived to undermine their exertions on all hands—he circulated evil reports concerning them—he prejudiced the minds of the country people against their necessities and pretensions to charity; in short, he ruined their character! They

either wandered about like ghosts, despised and unassisted, or they had to leave the county, and seek for better success in a district beyond the reach of Charlie.

Upon the principle which awards such severe punishment to mutineers at sea, he was at all times inexorable in punishing them if they grumbled at the extent of his profits, or the scantiness of the allowance he made them. In such cases, a severe fine at least was inevitable; and if the offence was attended with heinous circumstances, so as to exasperate his temper, he discarded them entirely from his employ. He was always very relentless, too, in discharging any one that attempted to get an increase of wages without leaving it to himself alone to settle the modicum of promotion. It is said that he once scored off about ten or a dozen hands, on hearing that a conspiracy had been entered into by a number of his band to get an addition to their wages by a general *strike*!

Nevertheless, like many other despots when they get their own way, Charlie was, when not fretted by opposition or misfortune, a kind and generous master. He seldom if ever failed, on settling accounts with his men on Saturday night, to treat them, “brats and callets, and all,” to such a scene of festivity as that described in the inimitable “*Jolly Beggars*.” Some of them, too, were allowed such wages, as, considering their rank in life and little necessity of expenditure, were certainly respectable. An industrious single man, with a good faculty of groaning, had perhaps ten shillings a-week; if blind, he was worth half a crown more. One with a wife that could tell fortunes was worth thirteen or fourteen shillings; if with eight or nine children, they were no bad bargain at a pound. A shrivelled wretch who could exhibit a good running ulcer in his leg, or shake a well-scorched arm in the eyes of the charitable, was in himself worth almost as much as a whole man with ten children; but the detruncated sailor who had neither arms nor legs, and who yet could sing one of those melancholy sea-songs, the cadence of which resembles nothing so much as the wind whistling through the shrouds—whose rude but pathetic strains of

“William Glen was our captain’s name,”

or,

“I am a poor sailor,
And far from my home!”

while they melted the hearts of the rustics, could elicit showers of sympathy in the substantial shape of half-pence—such a beggar, I say, was invaluable—his deserts could scarcely be stated—he was worth his weight in oatmeal every Saturday night!

BRAZIL.

BRAZIL is very singularly circumstanced among the nations of the American continent. It is the only state which has not adopted the republican form of government; and it appears that, in not adopting it, the people have been benefited. By this circumstance, mainly, the country has been saved from many of the evil consequences to be apprehended from a sudden and violent change in the character of its institutions.

The history of Brazil, previously to the revolution in 1808, caused by the removal of the royal court from Portugal to America, is almost nothing. This country, the most extensive in South America, and comprehending the richest portion of that peninsula, while it was held by the mother country, was governed according to such a rigid and narrow system of colonial policy, that, even in Portugal itself, little was known as to its internal wealth or management. It is a curious fact, as stated by Dr Walsh, that the Brazilian writers who lately published a history of their country, were chiefly indebted to our countryman Southey’s *History of Brazil* for their materials. So narrow and short-sighted was the policy of the government, that an intelligent stranger was enabled to glean more information relative to it than a native was permitted to gather from the legitimate sources of inquiry. Hence it was, that a nation so extensive that a year is required for corresponding between its remotest province and the capital, remained for centuries scarcely examined, scarcely cultivated, scarcely peopled—a blank in geography, and a blot upon its parent country.

Early in January 1808, an account was received at Rio Janeiro, that the combined French and Spanish armies were entering Portugal, and that, in consequence, the prince regent, afterwards king, had embarked with all the royal family for Brazil. “This news excited an extraordinary mixture of sorrow and joy—sorrow that such calamities should overwhelm the mother country, to which the good people of Brazil were still fondly attached, and joy that an august monarch, of whom they entertained the most exalted and extravagant notions, should condescend to visit their humble country, and take up his residence there.”

The first acts of the sovereign on his arrival confirmed the sanguine anticipations of his subjects. A royal charter was issued, abolishing the old exclusive system, and granting to the people of Brazil the free-

dom of commerce with all friendly nations. This edict, a Brazilian writer justly says, ought to be written in letters of gold.

Among the other benefits conferred on the country by the arrival of the court, was the influx of Portuguese of intelligence and rank, and the establishment of foreign mercantile houses, of which the English were the earliest. Next to opening the ports to foreign enterprise, was the encouragement of it among the natives of all classes, who by a royal decree were for the first time permitted the free exercise of every kind of industry.

At the same time was introduced that mighty engine of knowledge and power—a printing press. For three centuries this simple apparatus had been inhibited in Brazil, and it was not till the year 1808 that this great country was permitted to print even the leaf of a book. The estimation in which this royal gift was held by those for whose benefit it was intended, may be estimated from the fact, that in the city of Rio Janeiro alone there are now thirteen periodicals published, and universally circulated and read.

Other improvements followed in rapid succession. A national bank was opened, a school of anatomy and medicine was founded, vaccination was introduced, roads were cut into the interior, attempts made to settle the native Indians, and several regulations promulgated for bettering the condition of the negro slaves.

The natural effect of all these measures was the singularly rapid improvement of the people, united with a strong feeling of personal attachment to the person of the sovereign from whose voluntary impulses they emanated. In the year 1815, the prince regent assumed the title of king of Brazil. The effect of this change upon the Brazilians, though but that of a name, was electric. It was felt and expressed by a spontaneous illumination all over the country; to use the inflated expression of one of their writers, "from the Amazon to the river of Plata was one continued blaze."

But the king of the new-formed sovereignty did not possess the qualities necessary to secure the sentiments of attachment and respect which these acts had justly acquired for him. No nation was ever more indebted to a sovereign than the Brazilians to him, for the wise, beneficent, and liberal decrees which marked the first years of his trans-Atlantic residence. He gradually laid the foundation of that independence which they now enjoy, and fitted them for it by a succession of acts tending to improve and enrich the country, and to enlighten the people. But he was altogether unfitted, from the timidity of his character, and the irresolution of his measures, to direct the spirit of independence, when once excited. Controlled or influenced by those about him, who thought only of making new arrangements subservient to their own selfish interests, the execution of those salutary measures was thwarted or impeded by the functionaries to whom the execution of the details was necessarily entrusted; negligence, corruption, and venality, gradually crept into all the departments of government, and more particularly into the administration of justice, a department the purity of which is, above all, essential to the well-being and prosperity of the people.

While the feelings of veneration to the sovereign, first excited by his arrival, and subsequently heightened by the enlightened policy of his measures, were gradually wearing away, in consequence of his own personal weakness of character, and the vices of his dependents, those of attachment to the new constitution, which secured to the people a share in the legislature, were proportionably augmented. It was generally, and not illogically, argued, that the advantages derived from the revolution were due to the new regulations, which admitted the intellectual portion of the nation to a due share of that influence from which it had hitherto been excluded with so much jealousy, and that the practical defects under which every department laboured were attributable to the undue or overpowering influence of ill-directed regal authority. The natural result was an increased attachment to the democratical institutions, influenced also in no small degree by the example of the pure republics which were springing up on every side around them. The conflict of opinion broke out in some instances in insurrection; but those insurrections were formidable neither for the numbers engaged, nor for the length of their existence: they were easily and quickly suppressed, with little loss of life in the field, and still less on the scaffold. The country was then tranquillized; foreign intellect and capital poured in; its amazing natural resources were developed; the national institutions became consolidated; the title of government has experienced a nominal change from that of a kingdom to a monarchy; and to Don Joas some years ago succeeded his son Don Pedro, who, again, has been obliged to abdicate in favour of his son Don Pedro the Second, as yet a mere child. The country, however, though torn considerably by domestic factions, is likely to continue under its present constitution, the condition of the neighbouring republics being by no means such as to invite to a change.*

LARRY M'FARLAND.

We extract from "Traits and Stories of the Irish Peasantry," a work of remarkable talent, published two years ago in Dublin, the following most graphic account of an Irish household, in a state of decay through improvidence. The story, which unfortunately has a historical as well as poetical merit, is supposed to be told by a gossip at the hero's wake:—

They were, indeed, the best natured couple in Europe; they would lend you a spade or a hook in potato time or harvest, out of pure kindness, though their own corn that was drop-ripe should be uncut, or their potatoes that were a-tramping every day with their own cows, or those of their neighbours, should be undug—all for afraid of being thought unneighbourly. In this way they went on for some years, not altogether so bad but that they were able just to keep the house over their heads. They had a small family of three children on their hands, and every likelihood of having enough of them. Whenever they got a young one christened, they'd be sure to have a whole lot of the neighbours at it—and surely some of the young ladies, or Master George, or John, or Frederick, from the big house, should stand gossip, and have the child called after them. Then they should have tay enough to serve them, and loaf-bread and punch; and though Larry should sell a sack of seed oats or seed potatoes for to get it, no doubt but there should be a bottle of wine to thrate the young ladies or jintlemen. When their children grew up, little care was taken of them, becase their parents minded other people's business more nor their own. They were always in the greatest poverty and distress, becase Larry would be killing time about the squire's, or doing some handy job for a neighbour, who could get no other man to do it. They now fell behind entirely in the rint, and Larry got many hints from the squire, that if he didn't pay more attention to his business, he must look after his arrears, or as much of it as he could make up from the cattle and the crop. Larry promised well as far as words went, and no doubt hoped to be able to perform; but he hadn't steadiness to go through with a thing. Truth's best; you see, both himself and his wife neglected their business in the beginning, so that every thing went at sixes and sevens. They then found themselves uncomfortable at their own hearth, and had no heart to labour; so that what would make a careful person work their fingers to the stumps to get out of poverty, only prevented them from working at all, or druv them to work for those that had more comfort, and could give them a better male's mate. Their timpers soon began to get sour: Larry thought, becase Sally wasn't as careful as she ought to be, that if he had taken any other young woman to his wife, he wouldn't be as he was; she thought the very same thing of Larry. "If he was like another," she would say to his brother, "that would be up airly and late at his own business, I would have spirits to work, by rason it would cheer my heart to see our little farm looking as warm and comfortable as another's; but, *farer gairh*, that's not the case, nor likely to be so, for he spins his time from one place to another, working for them that laughs at him for his pains; but he'd rather go to his neck in wather than lay down a hand 'or himself, except when he can't help it." Larry, again, had his complaint—"Sally's a lazy trollop," he would say to his brother's wife, "that never does one hand's turn that she can help, but sits over the fire from morning till night, making birds' nests in the ashes with her yellow heels, or going about from one neighbour's house to another, goster and palavering about what doesn't consarn her, instead of minding the house. How can I have heart to work, when I come in, expecting to find my dinner boiled, but, instead of that, get her sitting on her hunkers on the hearth-stone, blowing at two or three green sticks with her apron, the pot hanging on the crook, without even the *white horses on it*. She never puts a stitch in my clothes, nor in the children's, nor in her own, but lets them all go to rags at once—the devil's luck to her! I wish I had never met with her, or that I had married a sober girl that wasn't fond of dress and dancing. If she was a good servant, it was only becase she liked to have a good name; for, when she got a house and place of her own, see how she turned out." From less to more, they went on squabbling and fighting, until at last you might see Sally one time with a black eye or a cut head, or another time going off with herself crying up to Tom Hance's, or some other neighbour's house, to sit down and give a history of the *ruction* that he and she had on the head of some thrife or another that wasn't worth naming. Their childer were shows, running about without a single stitch upon them, except ould coats that some of the servants from the big house would throw them. In these they'd go sailing about, with the long skirts trailing on the ground behind them; and sometimes Larry himself would be mane enough to take the coat from the *goorson*, and ware it himself. As for giving them any schooling, it was what they never thought of; but even if they were inclined to it, there was no school in the neighbourhood to send them to. It is a true saying, that as the ould cock crows, the young one larns; and this was true here, for the childer fought one another like so many divils, and swore like Trojans—for Larry, along with every thing else, when he was a Brine-oge, thought it was a manly thing to be a great swearer; and the childer,

when they got able to swear, warn't worse nor their father. At first, when any of the little souls would thry at an oath, Larry would break his heart laughing at them; and so, from one thing to another, they got quite hardened in it, without being any way checked in wickedness. Things at last drew on to a bad state entirely. Larry and Sally were now as ragged as Dives and Lazarus, and their childer the same. It was no strange sight, in summer, to see the young ones marching about the street as bare as my hand, with scarce a blessed stitch upon them that ever was seen, they dirt and ashes to the eyes, wadling after their uncle Tom's geese and ducks through the green dub of rotten water that lay before their own door, just beside the dunghill; or the bigger ones running after the squire's cars, when bringing home the corn or the hay, waiting to get a ride as the labourers would go back with the empty cars.

Larry and Sally would never be let into the squire's kitchen now, to ate, or drink, or spend an evening with the servants; he might go out and in to his male's mate along with the rest of the labourers, but there was no welcome for him. Sally would go down with her jug to get some buttermilk, and would have to stand among a set of beggars and cotters, she as ragged and as poor as any of them, for she wouldn't be let into the kitchen till her turn came, no more nor another; for the servants would turn up their noses with the greatest disdain possible at them both. It was hard to tell whether the inside or the outside of their house was worse; within, it would almost turn your stomach to look at it—the flure was all dirt, for how could it be any other way, when, at the end of every male, the *schrahag* would be emptied down on it, and the pigs that were whining and grunting about the door would brake in to the hape of praty skins that Sally would there throw down for them. You might reel Larry's shirt, or make a surveyor's chain of it; for bad cess to me, but, I believe, it would reach from this to the rath. The blanket was in tatters, and, like the shirt, would go round the house: their straw beds were stocked with the *black militia*—the childers' heads were garrisoned with *Sootch greys*, and their heels and heads ornamented with all description of kibes. There was only two stools in all the house, and a hassock of straw for the young child; and one of the stools wanted a leg, so that it was dangerous for a stranger to sit down upon it, except he knew of this failing. The flure was worn into large holes, that were mostly filled with slop, where the childer used to dabble about and amuse themselves by sailing egg-shells upon them, with bits of boiled praties in them, by way of a little faste. The dresser was as black as dirt could make it, and had on it only two or three wooden dishes clasped with tin, and noggins without hoops, a beetle, and some crockery. There was an ould chest to hould their meal, but it wanted the hinges; and the childer, when they'd get the mother out, would mix a sup of male and wather in a noggin, and stuff themselves with it, raw and all, for they were almost starved. Then, as the byre had never been kept in repair, the roof fell in, and the cow and pig had to stand in one end of the dwelling-house. Then, if a wet day would come, there wasn't a spot you could stand in for *down-rain*; and, wet or dry, Sally, Larry, and the childer, were spotted like trouts with the soot-drops, made by the damp of the roof and the smoke. The house on the outside was all in ridges of black dirt where the thatch had rotted, or covered over with chicken-weed or blind oats; but in the middle of all this misery they'd a horse-shoe nailed over the door for good luck. You know that in telling this story I needn't minton every thing as it just happened, laying down, year after year, or day and date; so you may suppose, as I go on, that all this went forward in the course of time. They didn't get bad of a sudden, but by degrees, neglecting one thing after another, until they found themselves in the state I'm relating to you—then struggling and struggling, but never taking the right way to mend. But where's the use in saying much more about it?—things could'n't stand; they were terribly in arrears; but the landlord was a good kind of man, and, for the sake of the poor childer, didn't wish to turn them on the world, without house or shelter, bit or sup. Larry, too, had been, and still was, so ready to do difficult and nice jobs for him, and would resave no payment, that he couldn't think of taking his only cow from him, or prevent him from raising a bit of oats or a plat of potatoes every year out of the farm. The farm itself was all run to waste by this time, and had a miserable look about it. Sometimes you might see a piece of a field that had been ploughed, all overgrown with grass, because it had never been sowed or set with any thing. The slaps were all broken down, or had only a piece of an ould beam or a thorn bush lying across, to keep the cattle out of them. His bit of corn was all eat away and cropped here and there by the cows, and his potatoes rooted up by the pigs. The garden, indeed, had a few cabbages, and a ridge of airly potatoes; but these were so choked with bur-docks and nettles, that you could hardly see them. I told you before that they led the devil's life, and that was nothing but God's truth; and, according as they got into greater poverty, it was worse. A day couldn't pass without a fight; if they'd be at their breakfast, maybe he'd make a potato hop off her skull, and she'd give him the contents of her noggin of buttermilk about the eyes; then he'd *fake* her

* Condensed from Dr Walsh's Notices of Brazil, 2 vols. 8vo. 1860.

and the childer would be in an uproar, crying out, "Oh, daddy, daddy, don't kill my mammy!" When this would be over, he'd get off with himself to do something for the squire, and would sing and laugh so pleasant, that you'd think he was the best tempered man alive; and so he was, until neglecting his business, and minding dances, and fairs, and drink, destroyed him.

EXPLANATION OF THE STOCKS.

THERE are few topics of conversation perhaps more frequently introduced, and, at the same time, less generally understood, than that of the Public Funds, and I know few subjects on which the un instructed can derive so little information from books. I am certain, therefore, that I will render a very acceptable service to many, and these not the least respectable of my readers, if I can throw so much light upon the subject as may enable them to understand the prices of the Stocks, as given in the public papers.

It is perhaps hardly necessary to remark, that, in every war in which this country has been engaged since the Revolution, the amount of the annual taxes has been found inadequate to defray the expenses of government. To supply the deficiency, our rulers have generally had recourse to loans—that is to say, they have borrowed money from such individuals as were able and willing to lend it, giving these individuals a security for the payment of a certain annual interest. To explain the nature of this transaction, I shall take a very simple case. Suppose, then, that L.100 is the sum which government wishes to borrow, and that an individual offers to lend that sum at an interest of 5 per cent. On paying down the money, the lender receives a bill, bond, or acknowledgment, for the amount; by which acknowledgment he is entitled to draw yearly from the public revenue L.5 of interest, but on the express condition that he is not to demand repayment of the principal, or sum lent, unless government is willing to repay it. The person who thus possesses the bill or acknowledgment is said to be a holder of L.100 of 5 per cent. stock, and the money lent upon that bill constitutes a part of what is called the national debt, because it is in fact borrowed by the nation, and the interest is paid out of the taxes. It is obvious, however, that few persons would be disposed to lend money on the condition of never being allowed to demand repayment, even though they were quite certain of receiving annual interest, and of transmitting the right to that interest to their posterity. To remedy this inconvenience, therefore, the lender who wishes to employ the sum which he lent to government in any other way, though he cannot directly demand repayment, is at liberty to sell his bill to any body who will purchase it, and for any sum that another may be willing to pay for it. In doing so, he merely sells to a second person the right which he himself possessed to the annual interest of L.5, and that second person is of course at liberty to dispose of his right to another in the same way. This transaction, in general, is called a *transfer of stock*; and in the particular case which I have supposed, the one is said to sell, and the other to buy, L.100 of 5 per cent. stock. If 5 per cent. be considered as a fair and equitable interest for money lent, it is obvious that such a bill as I have now been speaking of, or, in other words, that L.100 of 5 per cent. stock, is just worth L.100 sterling. It is possible, however, that in certain circumstances the holder of that bill may receive more, or be obliged to take less for it than L.100. If two or three individuals, for example, have each a sum of money, which they are anxious to lay out at interest, but find it difficult to do so, a competition will naturally take place among them to become the purchaser of the bill in question, which will always secure to the holder L.5 of yearly interest. The possessor of the bill will of course take advantage of this competition, and raise his price, say to L.105. The purchaser, therefore, pays L.105 for L.100 of 5 per cent. stock, or he lays out his money at an interest of L.5 for every L.105, which is at the rate of something more than 4½ per cent. If, on the other hand, however, the possessor of the bill or stock is anxious to dispose of it, while few are willing to buy it, he will be forced to offer it for less than L.100, say L.95. The purchaser, in this case, pays L.95 for L.100 of 5 per cent. stock, or he lays out his money at an interest of L.5 for every L.95, which is at the rate of something more than 5½ per cent. For simplicity of illustration, I have supposed that L.100 is the sum borrowed by government, and that of course there is just one bill to be disposed of, or transferred by the lender. If it be supposed, however, as is really the fact, that the loans generally amount to several millions, the necessity which the lenders are under of selling their bills, or, in other words, transferring their stock, will be more apparent. The transaction between government and the lenders is precisely the same in the case of millions as in that of a hundred; and it is unnecessary, therefore, again to illustrate the general principle of that transaction. It is evident, however, that even the most opulent merchants, who are generally the lenders, cannot be supposed to have such a command of money as to be able to advance ten or twelve millions to government at once. When they contract for a loan, therefore—that is, when they agree to lend

to government the sum required—they generally pay the money by instalments, or partial payments, at certain intervals, say one million a-month, till the whole is advanced. In the meantime, they sell or transfer the bills or securities which they receive from government, to those who may have money to lay out at interest, and who of course will be disposed to purchase such bills, so that the sale of the bills of the first instalment may enable them to pay the second. In this way, government securities or bills become articles of commerce, and their price is regulated, like that of any other article, according to the supply and demand. If we suppose, as before, that the contractors for the loan, that is, the original lenders, receive from government a L.100 bill for every L.100 sterling that they lend, bearing 5 per cent., they will gain or lose by the transaction, according as they can dispose of these bills for more or less than L.100. If the buyers are numerous compared with the quantity of bills—that is, if there be a great number who are anxious to have their money laid out at interest—they will be tempted, perhaps, to give, as was before supposed, L.105 for every bill; for though, by doing so, they will have only 4½ per cent. for their money, still it may possibly be more than they can draw for it in any other way, while the security is better than if they lent their money to private individuals or companies. In this case the contractor would gain 5 per cent. upon the loan, or L.50,000 on the whole ten millions. If, on the other hand, however, comparatively few persons are found disposed to lay out their money at 5 per cent., the contractors may be obliged to offer their bills for less than L.100, say, as before, L.95. In this case the contractors lose 5 per cent. on the loan, or L.50,000 on the whole ten millions. It is easy to see, from this view of the subject, how the price of stock is liable to fluctuation from accidental circumstances. I shall not attempt to enumerate these: but it may be worth while to point out how it is affected by peace and war, as these two states of the country are generally found to have the greatest influence in raising or depressing the value of stock. In the time of war, then, the price of stock is comparatively low, because, in such a state of things, it is likely that government will be under the necessity of borrowing; and as every loan produces new bills, the quantity of those to be disposed of, or, in other words, the supply of the market, will be increased. The price, therefore, will fall, for the same reason that the price of corn falls after a plentiful harvest. In time of peace, again, the price of stock is comparatively high, because, in such a state of things, the taxes are likely to be sufficient to defray the expenses of government without any loans, and consequently no new bills are to be disposed of, or the supply, though not positively diminished, ceases to be augmented. For the same reason, the price of stock in the time of war is materially affected by the nature of the intelligence that comes from the scene of action. If that intelligence be unfavourable, stock will fall, because there is a prospect either of protracted warfare, or of the necessity of more vigorous exertions on the part of government; in both which cases, new loans may be necessary, and consequently a new supply of bills will be thrown into the money market. On the other hand, should the intelligence be favourable, the price of stock will rise, because the prospect of a successful termination of the war renders it probable that there will be no new loan, and consequently no new supply of stock. It is this variation in the price of stock that gives room for the nefarious practice of stock-jobbing. That practice consists in raising and circulating reports calculated to raise or depress the price of stock, according to the particular views of the individual. If he wishes, for example, to sell his stock or bills, he endeavours to propagate some report or other favourable to the issue of the war, and the establishment of peace, in order, if possible, to raise the price of stock; and if he wishes to buy, he propagates reports of a contrary tendency. It is painful to think that this abominable system is sometimes carried on by men whose rank and station in society, to say nothing of the obligation of morality and religion, might be expected to place them far above any such disgraceful acts; but, in general, I believe it is confined to men of desperate fortune and little character, who subsist by a species of gambling, to which the finance system of this country has opened a wide and extensive field. I allude to those men who make a practice of buying and selling stock, without actually possessing any, and whose transactions, therefore, are nothing more than wagers about the price of stock on a certain day. To explain the nature of the transaction by an example, I shall suppose that A sells to B a government bill of L.100, or L.100 of 5 per cent. stock, to be delivered on a certain future day, and that the price is fixed at L.102. If, when the day arrives, the price of stock shall have fallen to L.100, A would be able to purchase the bill in question for L.100, while, in consequence of his bargain, B would be obliged to pay him L.102 for it, so that A would gain L.2. If, however, stock had risen to L.104, B would still be obliged to give only L.102, so that A would lose L.2; but instead of actually buying and selling the stock, the bargain is generally implemented by A paying to B, or receiving from him, the L.2, or whatever may be the sum of loss or gain. In such a case as this, it is obviously A's interest that the price of stock should fall, and as obviously B's interest that it should rise, between the day of the bargain and that of settling; and hence the temptation held out to both to circulate re-

ports favourable to their own particular views. B, or the buyer, is usually denominated a Bull, as expressive of his desire to *to* up; and A, or seller, a Bear, from his wish to trample upon or *tread down*. The law, of course, does not recognise a transaction which proceeds on a principle of gambling; but a sense of honour, or, what is perhaps nearer the truth, *self-interest*, generally secures the payment of the difference, as the person who refuses to pay his loss is exhibited in the Stock Exchange under the designation of a *lame duck*, a disgrace which is considered as the sentence of banishment from that scene of bustle and business.

I have, in the preceding remarks, for the sake of simplicity, represented the transfer of stock as carried on in a way somewhat different from that in which it is really conducted. I have considered the securities which government gives to those from whom money is borrowed as consisting of bills, and these bills as uniformly bearing interest at 5 per cent. Neither of these statements, however, is, strictly speaking, correct, as I shall have occasion more particularly to explain in a future communication; but as my object in this introductory paper was to simplify the subject as much as possible, for the sake of those who are unacquainted with it, I have chosen an illustration that appeared to me most elementary, and which, if well understood, will enable ordinary readers to comprehend with little difficulty the more intricate parts of the subject, to which I shall take the liberty hereafter to direct their attention.—*Blackwood's Magazine*, 1818.

PERSONAL SECURITY DURING A THUNDER STORM.

WITH respect to protection in the storm, it may be remarked, that, when exposed in the open country, we must avoid seeking shelter under a tree, or by the wall of any building; and, agreeably to the numerous observations we have made, such trees as are isolated, or stand apart—for instance, those in the middle of a field—are more likely to be struck by the lightning than such as form part of the group of a clump or forest; streamlets, rivers, ponds, or other collections of water, are dangerous, and may determine the lightning, which would find a superior conductor in the vertical human frame, and its circulating fluids; we must therefore retire from their banks. If the crash succeed the lightning with no sensible interval of time, we are exposed to the most imminent and immediate danger, and our obvious and best security is to throw ourselves down upon the ground, and maintain a horizontal position: being thoroughly wet will add to our safety; and if we can count from eighteen to twenty between the flash and succeeding peal, we are tolerably secure. It has been calculated that electricity moves with a velocity more retarded than light, and its movement is estimated at 1950 feet in a second of time: this being the case, we must deduct the movement of sound per second from the sum in question, which is 1142 feet; the remainder multiplied by the number of seconds between the flash and the peal will determine the distance from the observer. Let us suppose the interval is five seconds; then $1950 - 1142 = 808 \times 5 = 4040$ feet distance. The noise of the thunder is an announcement that the danger is over. The umbrella should never be used in a thunder-storm. When in the house we must not approach the fire-place, for the chimney lined with carbonaceous matter forms a tolerably good conductor. Last season a cottager was reading by the fire, the poker was inclined on the grate, and a dog was sleeping in contact with it: the dog alone was killed by the lightning, that descended by the chimney, and was conducted to the earth by the poker, while the man escaped, having received only an electric shock. In like manner the bell-pull must be avoided if attached by metallic wire, for the lightning has frequently entered a house, pervaded the bell-wire, and, finding no escape to the earth, has exploded here, burst through the window, and shattered a tree in the garden. In like manner all metallic objects whatever are to be diligently and studiously avoided, even gilded mirrors and picture frames. We have lately been astonished to remark, in an instance where the lightning entered a building, the very extraordinary avidity with which it seemed to have run about, as it were, in quest of some medium of escape from the premises; the very nails in the floor were attacked, as well as those which had attached the laths to the ceiling and partition; the hinge of the door, and even a nail which fastened the head of a spade to its shaft, were wrenched out and imbedded in the wall; it appeared, indeed, to have ramified like "wild fire," and attacked every thing in the shape of metallic matter, with a fierceness quite surprising.—*Murray's Atmospheric Electricity*, 1832.

PAUL HOLTON.

In the fourth volume of that most delightful series of tales and sketches, entitled "OUR VILLAGE," occurs the story of Paul Holton, a wealthy young farmer, who was likely to have obtained for his wife Letty Dale, a tanner's pretty daughter, till some ill-timed but not ill-intentioned raillery on her part, respecting his ill success at cricket, made him part in dudgeon, resolved to live no longer in that part of the country. The tale thus proceeds:—

The first tidings that Letty heard the next morning were, that Mr Paul Holton had departed over night, having authorised his cousin to let his houses, and to decline the large farm for which he was in treaty; the next intelligence informed her that he was settled in Sussex; and then his relation left Hazelby, and poor Letty heard no more. Poor Letty! Even in a common parting for a common journey, she who stays behind is the object of pity; how much more so when he who goes—goes never to return, and carries with him the fond affection, the treasured hopes, of a young unpractised heart,

And gentle wishes long subdued—
Subdued and cherish'd long!

Poor, poor Letty!

Three years passed away, and brought much of change to our country maiden, and to her fortunes. Her father, the jolly old tanner, a kind, frank, thoughtless man, as the cognomen would almost imply, one who did not think that there were such things as wickedness and ingratitude under the sun, became bound for a friend to a large amount; the friend proved a villain, and the jolly tanner was ruined. He and his daughter now lived in a small cottage near their former house; and at the point of time at which I have chosen to resume my story, the old man was endeavouring to persuade Letty, who had never attended a cricket match since the one which she had so much cause to remember, to accompany him the next day (Whit-Tuesday) to see the Hazelby Eleven again encounter their ancient antagonists, the men of East Woodhay.

"Pray come, Letty," said the fond father; "I can't go without you; I have no pleasure any where without my Letty; and I want to see this match, for Isaac Hunt can't play on account of the death of his mother, and they tell me that the East-Woodhay men have consented to our taking in another mate who practises the new Sussex bowling—I want to see that new-fangled mode. Do come, Letty!" And, with a smothered sigh at the mention of Sussex, Letty consented.

Now, old John Dale was not quite ingenuous with his pretty daughter. He did not tell her what he very well knew himself, that the bowler in question was no other than their some time friend, Paul Holton, whom the business of letting his houses, or some other cause, not perhaps clearly defined even to himself, had brought to Hazelby on the eve of the match, and whose new method of bowling (in spite of his former mischances) the Hazelby Eleven were willing to try; the more so as they suspected, what, indeed, actually occurred, that the East-Woodhayites, who would have resisted the innovation of the Sussex system of delivering the ball in the hands of any one else, would have no objection to let Paul Holton, whose bad playing was a standing joke amongst them, do his best or his worst in any way.

Not a word of this did John Dale say to Letty; so that she was quite taken by surprise, when, having placed her father, now very infirm, in a comfortable chair, she sat down by his side on a little hillock of turf, and saw her recreant lover standing amongst a group of cricketers very near, and evidently gazing on her, just as he used to gaze three years before.

Perhaps Letty had never looked so pretty in her life as at that moment. She was simply drest, as became her fallen fortunes. Her complexion was still coloured, like the apple-blossom, with vivid red and white; but there was more of sensibility, more of the heart in its quivering mutability, its alternation of paleness and blushes. The blue eyes were still as bright, but they were oftener cast down; the smile was still as splendid, but far more rare; the girlish gaiety was gone, but it was replaced by womanly sweetness—sweetness and modesty formed now the chief expression of that lovely face, lovelier, far lovelier, than ever. So apparently thought Paul Holton, for he gazed and gazed with his whole soul in his eyes, in complete oblivion of cricket and cricketer, and the whole world. At last he recollected himself, blushed and bowed, and advanced a few steps as if to address her; but, timid and irresolute, he turned away without speaking, joined the party who had now assembled round the wickets; the umpires called "Play!" and the game began.

East-Woodhay gained the toss and went in, and all eyes were fixed on the Sussex bowler. The ball was placed in his hands; and instantly the wicket was down, and the striker out—no other than Tom Taylor, the boast of his parish, and the best batsman in the county. "Accident, mere accident!" of course, cried East-Woodhay; but another and another followed: few could stand against the fatal bowling, and none could get notches. A panic seized the whole side. And then, as losers will, they began to

exclaim against the system, called it a toss, a throw, a trick—any thing but bowling, any thing but cricket; railed at it as destroying the grace of the attitude, and the balance of the game; protested against being considered as beaten by such jugglery; and, finally, appealed to the umpires as to the fairness of the play. The umpires, men of conscience, and old cricketers, hummed and hawed, and see-sawed; quoted contending precedents and jostling authorities; looked grave and wise, whilst even their little sticks of office seemed vibrating in puzzled importance. Never were judges more sorely perplexed. At last they did as the sages of the bench often do in such cases—reserved the point of law, and desired them to "play out the play." Accordingly, the match was resumed; only twenty-seven notches being gained by the East-Woodhayians in their first innings, and these entirely from the balls of the old Hazelby bowler James White.

During the quarter of an hour's pause which the laws allow, the victorious man of Sussex went up to John Dale, who had watched him with a strange mixture of feeling, delighted to hear the stumps rattle, and to see opponent after opponent throw down his bat and walk off, and yet much annoyed at the new method by which the object was achieved. "We should not have called this cricket in my day," said he; "and yet it knocks down the wickets gloriously too." Letty, on her part, had watched the game with unmingled interest and admiration: "He knew how much I liked to see a good cricketer," thought she; yet still, when that identical good cricketer approached, she was seized with such a fit of shyness—call it modesty—that she left her seat, and joined a group of young women at some distance.

Paul looked earnestly after her, but remained standing by her father, inquiring with affectionate interest after his health, and talking over the game and the bowling. At length he said, "I hope that I have not driven away Miss Letitia."

"Call her Letty, Mr Holton," interrupted the old man; "plain Letty. We are poor folks now, and have no right to any other title than our own proper names, old John Dale and his daughter Letty. A good daughter she has been to me," continued the fond father; "for when debts and losses took all that we had—for we paid to the uttermost farthing, Mr Paul Holton—we owe no man a shilling!—when all my earnings and savings were gone, and the house over our head—the house I was born in, the house she was born in—I loved it the better for that!—taken away from us, then she gave up the few hundreds she was entitled to in right of her blessed mother, to purchase an annuity for the old man, whose trust in a villain had brought her to want."

"God bless her!" interrupted Paul Holton.

"Ay, and God will bless her," returned the old man, solemnly; "God will bless the dutiful child, who despoiled herself of all to support her old father."

"Blessings on her dear generous heart!" again ejaculated Paul; "and I was away, and knew nothing of this!"

"I knew nothing of it myself until the deed was completed," rejoined John Dale. "She was just of age, and the annuity was purchased and the money paid before she told me; and a cruel kindness it was to strip herself for my sake; it almost broke my heart when I heard the story. But even that was nothing," continued the good tanner, warming with his subject, "compared with her conduct since. If you could but see how she keeps the house, and how she waits upon me; her handiness, her cheerfulness, and all her pretty ways and contrivances to make me forget old times and old places. Poor thing! she must miss her neat parlour, and the flower garden she was so fond of, as much as I do my tanyard and the great hall; but she never seems to think of them, and never has spoken a hasty word since our misfortunes, for all you know, poor thing! she used to be a little quick tempered!"

"And I knew nothing of this!" repeated Paul Holton, as, two or three of their best wickets being down, the Hazelby players summoned him to go in. "I knew nothing of all this!"

Again all eyes were fixed on the Sussex cricketer, and at first he seemed likely to verify the predictions and confirm the hopes of the most malicious of his adversaries, by batting as badly as he had bowled well. He had not caught sight of the ball; his hits were weak, his defence insecure, and his mates began to tremble, and his opponents to crow. Every hit seemed likely to be the last; he missed a leg ball of Ned Smith's, was all but caught out by Sam Newton, and East Woodhay triumphed, and Hazelby sat quaking, when a sudden glimpse of Letty, watching him with manifest anxiety, recalled her champion's wandering thoughts. Gathering himself up, he stood before the wicket another man; knocked the ball hither and thither, to the turnpike, the coppice, the pond; got three, four, five at a hit; baffled the slow bowler James Smith, and the fast bowler Tom Taylor; got fifty-five notches off his own bat; stood out all the rest of his side; and so handled the adverse party when they went in, that the match was won at a single innings, with six-and-thirty runs to spare.

Whilst his mates were discussing their victory, Paul Holton again approached the father and daughter, and this time she did not run away. "Letty, dear Letty," said he; "three years ago I lost the cricket-match, and you were angry, and I was a fool. But, Letty, dear Letty, this match is won; and if you could but know how deeply I have repented, how earnestly I

have longed for this day! The world has gone well with me, Letty, for these three long years. I have wanted nothing but the treasure which I myself threw away, and now, if you would but let your father be my father, and my home your home!—if you would but forgive me, Letty!"

Letty's answer is not upon record; but it is certain that Paul Holton walked home from the cricket-ground that evening with old John Dale hanging on one arm, and John Dale's pretty daughter on the other; and that, a month after, the bells of Hazelby church were ringing merrily in honour of one of the fairest and luckiest matches that ever cricketer lost and won.

BURNS.—REAL FAME.

In one of my many wanderings, I happened to pass the month of January 182— in a Benedictine monastery at the base of Mount Etna. The superior of the establishment was one of the most perfect gentlemen, and the best informed priest, I ever knew. As is pretty general in the order of Benedictines, he was a younger son of one of the noblest families in Sicily; and interest united with merit had elevated him thus high while still a very young man. To this similarity of age, and in some measure of tastes, do I ascribe the almost fraternal intimacy which soon subsisted between us. Never shall I forget the days we spent together. One evening is now present to my mind's eye as if actually passing. Conversation and reading had caused the early portion of the night to wear rapidly away, to the nearly total forgetfulness of the storm without. As it grew late, however, the hurricane increased, so as to excite an almost painful feeling; and its natural associations of melancholy were deepened in my imagination by the hollow booming of the priory bell, as it was occasionally half swung round by the blast. In the apartment of the youthful monk, however, all was comfort. The suite consisted of two chambers, the exterior, except in extent, little distinguished from those of the brotherhood; but the inner, in which we were seated, still more capacious, exhibited, in its walls, hung round with tapestry and ancient-looking paintings—its massive cabinets, and high-backed chairs of dark and richly-carved chestnut wood—the very ideal of monastic elegance. Over the antique garniture, a pile of fagots blazing in the high chimney, from a huge but picturesque stand of iron, threw a cheerful light, reflected in a thousand flickering shadows from the polished or broken surfaces upon which it fell. We had drawn our seats towards the hearth, consequently somewhat in advance of the table at which we had been reading, and still covered with books and papers. An illuminated missal lay open, and near it a silver bell and crucifix, while a bronze tripod of veritable Greek workmanship supported a lamp in the centre, showing, amid all these intellectualities, my substantial cold supper, where wine—true *lachryma Christi*—was not forgotten, with the prior's simple omelet in the remote corner. But with all these external appliances, both seemed more inclined to indulge in that quiet, unobtrusive, though, perhaps, somewhat selfish enjoyment, arising from the internal sense of security in the midst of languor and discomfort. It was probably this sentiment which caused me almost unconsciously to ejaculate—

"The storm without might rair and rustle,
Tam didna mind the storm a whistle."

"That's Burns," exclaimed the prior, to my astonishment. Burns known to a monk at the foot of Mount Etna! That surpassed all my preconceived notions. The prior, doubtless, observing my surprise, explained that he knew only these two lines, but that they had excited a strong desire to know something more, concluding with the question, "Is it possible to procure a Latin translation?" I suppose my expression was not altogether consistent with perfect politeness at the idea of the rhymes of the Scottish ploughman writhing under the infliction of classic hexameters or Horatian lyrics, for my friend, looking in my face, hastened to add, in an extenuating tone, "I should esteem it the most curious work in our library." "And assuredly, my dear father," rejoined I, laughing, "such a volume would prove the greatest curiosity in any library." "Nay, nay," interrupted the prior, perceiving himself to be getting deeper and deeper into some absurdity, though what he knew not, "hear my story out:—

"Two years ago, upon a night of storm similar to the present, the superior, for I was then but sub-prior, and myself, were seated together as we two now are; but," glancing his eye, with a half conscious smile, round the apartment, "this chamber then showed somewhat less of propriety. From a dull enough

à-la-lite, we were roused by a loud knocking at the outer gate, and in a few minutes a lay brother, dispatched by the sacristan, announced the arrival of strangers, who requested shelter. The situation of our house, on the route between one of the principal fruit and wine districts and Syracuse, exposes us to frequent claims of this nature. From my smattering of languages, I was, as usual, deputed to see the guests accommodated in the refectory. They were six in number—an English and Scotch merchant, partners in a firm at Palermo, and who were known to me; an Irishman, making the tour of the island; a German architect, with an American and a Frenchman, officers of an American vessel lying at Messina, completed the company.

"These gentlemen had been proceeding in opposite directions; but happening to meet in the vicinity of our establishment, had been recommended by their guides to turn aside with us for the night. I found them intelligent and well informed on most subjects, but disagreeing with each other on every possible topic. Politics, trade, literature, successively became subjects of discussion and of quarrel. But all preceding dispute had been as nothing compared with the war of words which arose on the antiquity of their respective nations, the American infusing bitterness into the contention by the utter disdain with which he affected to treat all such claims. I thought my guests would actually proceed to the extremities deprecated by the Roman poet, and convert the implements of feasting into deadly weapons, when the Scot, who had been among the keenest, stood up, and, as seemed to me, in a tone of defiance, repeated the lines you now quoted. The verse, however, appeared to act as a sedative on the spirit of strife; for the Englishman good-humouredly called out, 'Ha, Stewart, on your hobby!—there, at least, you think you have the advantage, and I confess we possess no national poet, who, like Burns, comes home to the bosoms of the poor, yet awakens the admiration and sympathy of the great.' 'Pardon me,' replied the Irishman, 'you speak, of course, only as respects England; the beauty of our national poetry is felt and allowed by all ranks; but I willingly acknowledge the merit of Burns.' 'None of you,' interrupted the American, 'ever felt his full power; read or listen to his strains in our deep solitude of forest or savannah, and think that five thousand miles of ocean separate you from the country of your forefathers, the home and sanctuary of the poet's imagery—then talk of feelings. No, no—you would be silent. I am,' continued he, 'myself a Yankee, as you contemptuously term it; and I am proud of being a genuine son of America; but my mother was Scotch. Often, when a child, have I sat upon her knee, while she wept and repeated from Burns. For his sake, and for hers, I love the country of my mother. Whole generations feel as I do; and when every other tie is broken between Britain and America, Burns, and such as Burns, will teach our children's children that they are come of one race.'

"Even the Frenchman," resumed the prior, "had heard of Burns, as uniting the descriptive powers of Delille with the simplicity of La Fontaine; while in Germany, where English literature is generally known, the architect told us Burns had been described to him as combining the power of Goethe with the sweetness of Gelert. Collecting some idea of his character from these remarks, I, willing to say something, observed to the Scotsman, that I supposed his poet resembled the Sicilian bard Meli, and in this comparison found I had come as near as our more artificial literature permits. In short, we discovered that, in our admiration of a man of genius, we had at least one common feeling, and thenceforward the evening passed away in the most cordial and entertaining conversation.

"Now, my good friend," concluded the prior, with a smile, laying his hand on my shoulder, "why I should esteem the works of your Scottish bard the most valuable curiosity in our library, arises from this—that I could point them out to our visitors as a volume, on the merits of which men from the most distant countries, and of the most opposite sentiments, coincided—although they in nothing else agreed."—*Edinburgh Spectator*.

TRICKS UPON TRAVELLERS.

When Cooper and Twaits, after a successful campaign at the Boston theatre, returned to New York, Twaits used to tell the following and other anecdotes, for the purpose of playfully annoying Cooper—"As we were returning from Boston, our style of travelling made the folks stare. Our carriage, and servant, and trunks, seemed particularly to excite the curiosity of the landlord at an inn where we stopped to breakfast; and he saw that Tom was a great man at once. I was only the great man's companion, and he took an opportunity to inquire who this might be. 'It's the great Mr Cooper,' said I, 'going on from Boston to New York.' 'What! a congress man?' 'No; you must have heard of him—the playactor.' 'Playactor!—oh, oh! What does he do?' 'Plays all kind of tricks.' 'Oh, ho! tumbling—rope-dancing—oh, ho!' All the landlord's awe of the traveller was gone, but his curiosity yet more fully alive; and he walked into the room which Cooper had taken possession of to await breakfast, and seated himself to gaze his fill. I fol-

lowed, and soon after in ran a rough little urchin, and placed himself between his father's knees, who, patting his white head, and looking at Cooper, says, 'Sonny, that's Mr Cooper, my dear—won't you go to New York with Mr Cooper?' 'For what, daddy?' 'Why, he'll make an actor of you.' 'What's that, daddy?' 'Oh, he'll learn you to dance the rope, turn over head and heels, and play all kinds of tricks.'—*From Dunlap's Anecdotes of the American Theatre*.

VENICE.

To the eye of the stranger the aspect of Venice first presents itself like some vision of the deep, while her history fills the mind with awe and wonder at the stern and fearful realities and heroic recollections with which it abounds. She stands alone and unparalleled in the annals of Italy's tempestuous republics—those hypocrites of liberty, which recoiled from foreign despotism only the more effectually to exalt themselves by harassing and oppressing each other. While, torn by internal factions and successive revolutions, the rest of Italy wielded at will their fierce democracies, Venice preserved unshaken her "high and palmy state," based on the deep invisible foundations of her more than Machiavellian system—the combination of petty tyrants, which, unlike that of slaves, seldom fails to accomplish the objects it has in view.

The Venetians arrived at their highest national glory when the capital of the eastern empire acknowledged them its conquerors. The wealth which that event poured into their treasures made them the richest people in Europe—the fame which they acquired by it made them the most respected and renowned. But it is doubtful whether it was not the forerunner of the worst disasters which the republic was destined to suffer. In less than a century after this triumph, which rendered it in the eyes of Europe the great barrier against the power of the infidel, it had to support three sharp and bloody contests with the increasing strength of the Turks, and had suffered a disheartening defeat in all.

The celebrated Selim the First, and his son Soliman the Second, carried on successful wars with both native and foreign enemies; and the Ottoman power, every year acquiring fresh force, began more imminently to threaten the proud republicans. After forcing them to pay tribute to Cyprus, Selim the Second conceived the project of regaining entire possession of that rich and valuable island. While he was carrying on preparations for this enterprise, the Venetians were still further discomfited by the explosion of their arsenal, which, in the night of September 13th, 1569, tore up their walls and towers, part of their streets, and four churches. The nobles, astonished, and not knowing the cause of the frightful tumult, ran to arms; and the whole population of the city, believing that an enemy had forced and thrown down the fortifications, hastened to secure themselves by flight.

The storm at length broke forth, and the Venetians found themselves opposed to the whole strength of the Moslem, whose forces were seen covering the neighbouring shores of the gulf. The siege of Famagouste immediately followed, and the noblest spirit of the republic was manifested in the defence. After a desperate conflict, Bragadino, the chief of the garrison, having neither the means of subsisting his people, nor of supporting any further attacks, accepted the capitulation offered by Mustapha, the Ottoman leader. A few days were spent in settling the preliminaries; and the Moslem, expressing his high admiration of the Venetian captains, invited them to his tent. Bragadino, accordingly, and several of his officers, proceeded one evening to the entrenchment; the former on horseback, clad in the scarlet robes of a Venetian magistrate, and shaded by a parasol of the same colour. The pacha received them with great courtesy, but demanded hostages to secure the fulfilment of the capitulation. The chief haughtily replied, that the honour of Venice might be well trusted in; on which Mustapha, in a burst of fury, instantly ordered several of the officers to be strangled, only sparing Bragadino for greater cruelties. After the unfortunate captain had been forced to see the execution of his friends, his ears were cut off, and he was led through the town as a malefactor. He was then placed on a scaffold, fastened to a stake, and flayed alive, the infamous Mustapha enjoying the spectacle from a balcony, and afterwards causing the skin of the brave Venetian to be stuffed and paraded about the streets, with all the insignia of the magistracy.

The battle of Lepanto shortly followed this event, and modern history records few engagements which

it does not surpass in celebrity. It was in the same situation that the fate of Rome was decided by the battle of Actium; and though the latter was productive of the most important consequences, and the former was followed by none, it is doubtful to which warlike fame would give the greater glory. Certainly never had greater courage or skill been displayed in naval warfare than in this engagement. During the chief part of the day, the combined Venetian and Spanish forces, and the whole strength of the Ottoman fleet, were opposed in close and incessant combat; and when the latter fled from the straits, it had lost near two hundred vessels, and thirty thousand men. Venice, whatever glory she had acquired by this victory, reaped no advantage from it; and finding that the confederacy she had formed would not effectually aid her in the principal object she had in view, the government made peace with the Ottoman, and ceded the disputed possessions.

The elevation of Camillo Borghese to the pontifical chair, under the name of Paul the Fifth, gave birth to the most remarkable struggle which the republic had ever sustained. The new pope was determined to exercise his power to the utmost, and the Venetians were resolved to follow their usual customs in all ecclesiastical matters.

Paul had been known to say, that if he were pope, and the Venetians gave him any cause of uneasiness, he would at once launch against them the thunders of the church; "and I," said the ambassador Leonardo Donato, "if I were doge, would despise your anathemas." It was remarkable enough that they were now both in the situations alluded to, and both prepared for putting their respective threats into execution. The first cause of complaint with the pope was the two fundamental laws of the republic, which forbade the building of churches without the permission of government, and the alienation of estates in favour of ecclesiastics. He next took offence at the imprisonment of a monk who had violated a female under circumstances of great atrocity, and demanded that he should be judged by his own order: which the council not only refused, but shortly after arrested the Abbé of Nervesa for similar dissoluteness of manners. To revenge himself for these affronts, the pope protested against the election of Leonardo Donato to the ducal throne, and the contest began with a violence unknown before. At last the pope put the whole state, 17th April 1606, under the ban of excommunication. Venice was astonished, but not terrified, at the announcement. The council ordered the religious services to continue as usual, and were obeyed by all the secular clergy, but not by the monks or the Jesuits, who were immediately expelled in consequence of their endeavour to evade the decree. After a long contest, well supported on both sides, the combatants found it necessary to enter into negotiations for peace. Various states offered to act as arbitrators; and, by the mediation of the French, the republic was induced to resign the two priests to the judgments of the church, and the ill-satisfied pontiff to accept of this tribute to his authority, and agree to remove the excommunication, though Venice retained all her laws and boasted independence undiminished.

But the severe and determined policy out of which this resistance sprung, was not a sufficient safeguard against the evils which were about to assail the republic. So splendid hitherto had been her condition, that even the cities through which a portion of her wealth had to pass, were regarded by other states with wonder and envy. The citizens of Bruges, it is said, emulated the pomp and luxury of the proudest courts; and when Joanna, wife of Philip le Bel, visited them, she angrily exclaimed at seeing the costly dresses and ornaments of the merchants' wives, "I thought that I had been the only queen here, but I find that there are many hundred more." The same observation would have applied to other cities as well as to Bruges; and if it was thus with places into which only the drops fell from the golden vessel of Venetian wealth, how are we to estimate the prosperity of Venice herself? The advantages thus enjoyed were also supported by the determined feeling of the people. They saw the true principles on which alone their grandeur could be permanently fixed, and they followed them too often, it is melancholy to add, to the violation of truth and freedom; but at other times with a keen, foreseeing wisdom, which has never since been so long and uniformly practised by a whole people. Thus, when threatened by the league of Cambray, they came forward and lent the best part of their fortunes to the state; and while the king of France had to pay forty-two per cent. for the money he expended in the war, Venice could raise millions at five per cent. When attacked by the Genoese, they practised a still greater generosity, and voluntarily brought sufficient to the public treasury to raise additional forces; and when the struggle with Ferrara pressed hard upon the usual revenues of the state, they not only cheerfully obeyed the first demands of the senate, but offered their jewels, their gold and silver, and other articles of luxury, to aid the cause of their country. And thus, supported by a deep, fearless, and unsparing policy on the one side, and by so wise a patriotism on the other, Venice might fairly hope to withstand every enemy, whether spiritual or temporal—whether the banded princes of Europe, or the fierce and ambitious Moslem. But Columbus and Vasco de Gama humbled a power which neither popes,

princes, nor sultans, could unsettle or overthrow. Their discoveries tore away its pomp and glory, as the diffusion of knowledge in a subsequent age humbled those of Rome.

But the deep and hitherto successful projects of this mysterious government were in a few years to be proved altogether unequal to meet the new spirit of enterprise then abroad in the world. The instability of the government, and a universal corruption of manners, contributed still more to the changes on the eve of taking place, and which were to reduce the once magnificent Venice to the lowest rank among nations. The degradation of the nobles at the commencement of the eighteenth century may be proved by the fact that the Ridotto, an immense building devoted to games of hazard, was the privileged resort of the patricians. Seventy or eighty tables were placed in its vast halls, at which the nobles only had the right of playing. Seated there, clad in their robes of state, and with their faces uncovered, the especial privilege of these honourable gamesters, they not only played for themselves, but were the capitalists of others who wished to engage in such enterprises, and were paid either by the year, month, or hour, for the accommodation they thus rendered to inferior speculators.

Such was the state of manners in Venice when it had to meet the shock of the French revolution. For many years past, the favourite maxim of its statesmen had been, to preserve peace at any sacrifice; and they had in consequence suffered the fortifications to decay, their arsenal to remain without defence, and their fleet in the same condition as when they had to fear no enemy or rival. When the war between France and the other states of Europe commenced, they would fain have acted on the maxim they had thus devoutly embraced, and determined to preserve a strict neutrality. But they were quickly undeceived in their hopes; and Verona and Padua had no sooner yielded to the French, than they saw them approach within sight of their own shores. On the 30th of April 1797, memorable day for Venice, the doge summoned all the different departments of the government to deliberate on the situation of the state. Various were the opinions advanced on the occasion: midnight had already passed, and they had formed no determination as to what measures they should pursue, when a letter was delivered from the commander of their flotilla, announcing that the French had already commenced preparations for a blockade. Consternation was visible in every countenance; and the doge, agitated and trembling, walked up and down the apartment, exclaiming, "This night even we are not sure of sleeping tranquilly in our beds!" How changed was the Venetian spirit from what it was when the blind old Dandolo faced the batteries of Constantinople! It was at first decided that the operations of the French should be resisted, but a counter resolution reduced this determination to nothing; and the procurator Pesaro, almost the only member of the state who seemed to feel the degradation of his country, sighed deeply, and said, with tears in his eyes, "I see the fate of my country!—I cannot succour it; but a brave man finds a home any where: I must seek mine in Switzerland."

In a subsequent meeting it was debated whether a change in the constitution might not serve to remove some of the evils which were hanging over the state. The grand council was assembled to deliberate on the project. The palace on this occasion was surrounded with troops and cannon; the workmen of the arsenal, and different companies of citizens, were all under arms; while patrols hastening along the streets, their faces displaying signs of fear and amazement, served to spread apprehensions through every quarter of the city. Six hundred and nineteen senators met in this hour of terror, to resolve on such measures as their situation allowed them to take. The doge, bowed with affliction, read a proposition, the purport of which was, to consider, with Bonaparte, what changes might be most profitably made on the government. A mournful silence succeeded; the measure was put to the vote, and four hundred and ninety-eight members of the council declared themselves in its favour. When the report of this determination was presented to Napoleon, he replied, that unless the death of his captain Laugier, and some others who had fallen in a late affair with the Venetian fleet, were revenged by the immediate punishment of those who had authorized the assault, he would in fifteen days enter Venice sword in hand. Neither the doge nor his councillors had any means of resistance to propose, and they therefore gave their commissioners full power to treat with the general on his own terms. They found Bonaparte at Milan, and there a treaty was entered into, that put an end to the sovereignty of the great council, which was thenceforth to reside in the whole body of the citizens.

On the 12th of May, while the council was holding its final session, and the doge was lamenting the miserable condition to which he was reduced, the sound of musketry was heard near the palace. The most frightful confusion immediately prevailed throughout the chamber. Every one believed himself on the point of being massacred; and without further debate, and more like madmen than senators debating for the good of their falling country, they hastily gave their suffrages and departed.

The people who surrounded the palace, seeing a signal displayed at the windows, which announced to them the termination of the debate, expressed their

feelings on the occasion in loud and contradictory vociferations. While some uttered exclamations in favour of the French, others were as eager in their lamentations over the fall of their ancient constitution; but all united in contributing to the confusion of the moment, by abandoning themselves to pillage or licence. The night approached, and still these disorders remained unexpressed, till, about two hours after midnight, a small detachment of soldiers assembled on the Rialto, and some cannon being posted there, the mob was dispersed. In the morning a proclamation was issued, prohibiting, under pain of death, any opposition to the decree which had been passed.

On the 16th of May 1797, three thousand French troops disembarked on the Place Saint Mark, in the midst of the wild shouts of one part of the population, and the mournful tears and lamentations of the other. The demolition of the prisons of the inquisition was the first act of the new government; the burning of the book of gold, consecrated to the enrolment of the nobility, was the next; while the Lion of Saint Mark, instead of the inscription which designated his sacred character, was now made to bear the motto of "THE RIGHTS OF MAN."

But Venice was not yet reduced to its lowest stage of degradation. It had fallen beneath a conqueror, but it had never yet been made an object of barter between one master and another. To this, however, it was now reduced. By the treaty of Campo Formio, Venice was ceded to Austria, whose forces entered the city on January 18, 1798. The state inquisition was re-established, and Pesaro, who had made such a display of his patriotism in the scenes which preceded the final humiliation of his country, actually re-appeared in the character of an Austrian commissary. It was before him that the humbled patricians had to take the oaths of allegiance to their new master; and the ex-doge, who, though too weak and undecided for the situation he held, had the love of his country deep at heart, fell, as he pronounced the words of the oath, senseless on the ground. Thus sunk the free and queenly Venice.—*Landscape Annual*, 1831.

CLIMATE OF THE CANADAS.

THE prevailing winds, both in Upper and Lower Canada, are the north-east, north-west, and south-west, which all have a considerable influence on the temperature of the atmosphere and the state of the weather. The south-west wind is the most prevalent, but it is generally moderate, and accompanied by clear skies; and the north-east and easterly winds usually bring with them continued rain in summer, and snow in winter; the north-west is remarkable for its dryness and elasticity, and, from its gathering an intense degree of frigor, as it sweeps over the frozen plains and ice-bound hills in that quarter of the continent, invariably brings with it a perceptible degree of cold. Winds from due north, south, or west, are not frequent. At Quebec, the direction of the wind often changes with the tide, which is felt for nearly sixty miles higher up the stream of the St Lawrence.

The azure of Canadian skies is beautifully transparent and pure, and the starry constellations are remarkably luminous and bright. The northern region of the heavens is very frequently glowing with the vivid coruscations of the evanescent aurora borealis, whose vertical irradiations are often of sufficient brilliancy to dispel the darker shades of night. This aerial phenomenon is sometimes so beautiful and sublime at Quebec, that it not unfrequently attracts considerable crowds on the ramparts and elevated public walks, to admire its waving and shooting splendours.

Fogs are almost unknown in Canada, but the morning dew sometimes rises in a light vapoury cloud, which is almost suddenly dispelled by the first solar rays that gladden the horizon.

In summer, the electric phenomena of the atmosphere, as displayed in the vividness of lightning and the burst of loud thunders, are sometimes appalling in the extreme, and have, in numerous instances, been attended with very serious consequences. The destruction of extensive barns and hay-stacks, and in several cases the loss of human life, are among the disasters that on some occasions result from the violence of thunder-storms in Canada, and particularly in the neighbourhood of Quebec, where it is probable the electric matter is more powerfully attracted by the elevation of the mountains, and the magnetic properties it is likely they possess.

In point of salubrity, no climate in the world can perhaps be found to exceed that of Canada, which is not only a stranger naturally to contagious disorders, or fatal epidemics, but extremely conducive to longevity. In the early periods of the settlement of the upper province, the fever and ague were indeed very prevalent; but as the cause of this local affection was gradually removed by the draining of marshes in the progress of cultivation, it has almost entirely disappeared. It is impossible, however, to guard on all occasions against the introduction of infectious diseases into the towns; and we therefore find that malignant fevers have in some cases crept into hospitals; but

these cannot affect the general character of the climate, and the healthfulness and invigorating elasticity of the atmosphere.—*Macgregor's British America*.

STORMING OF BADAJOS.

A SORTIE was made on the 19th of March, with about 1500 infantry and some cavalry, who were driven back with considerable loss. Just before the sortie was made, and for some time after it was repulsed, every gun on the works was kept in play on the troops in the trenches, in the most furious manner, and it occasioned us a heavy loss. The siege was prosecuted with the utmost vigour, in spite of the rains, which descended almost without intermission during the first ten days, and filled the trenches with water. So many men were required to carry on the operations, that nearly one-half of our time was spent in the trenches. On the 25th our batteries opened their fire on the town, which was returned with equal spirit. The same night Fort Piccurina was stormed and carried by detachments from the 3d and light divisions, after considerable resistance, and with the loss of many men. Immediately on its fall, another parallel was commenced. From the ravelin of San Roque, and from the walls of the town, the covering parties were exceedingly galled by a constant fire of musketry. In the end of March and the beginning of April, our batteries were in full play on the town, which being breached in several places, orders were given that it should be stormed on the night of the 6th of April. Two breaches were to be stormed by the 4th and light divisions, the former assaulting that on the right, and the latter that on the left. The 3d division was to escalate the castle; whilst the 5th division, which had not taken part in the siege, and had recently arrived in the neighbourhood, was directed to attack the town and the fort of Pardalleras to the left of the light division. Some Portuguese troops threatened Fort San Christoval and the works on the right of the Guadiana. Soon after dark the columns moved out of the trenches to the different points allotted them to attack. Major O'Hare, of the 1st battalion 95th, commanded the storming party which headed the light division; and some companies of our corps lined the glacis, to keep down the fire of the enemy from the ramparts. The discharge of grape-shot and musketry, with buck-shot in addition to bullets, the hand-grenades, rafters of wood, and various weapons of destruction hurled from the ramparts on the heads of the assailants in the ditch, in their desperate and reiterated attempts to force their way through the breaches, and to mount the ladders for the escalade of the castle and town, was of so dreadful and destructive a nature, as to beggar all description, and to render it a hopeless undertaking for the most gifted person to depict in true colours. The enemy had dug deep trenches between the top of the breaches and the town, and fixed sword-blades and pikes in the trench. From some houses near the top of the breach, a terrible fire of musketry was poured on such as contrived to reach its summit. Those obstacles alone were insurmountable, without the addition of a continued and most deadly fire of grape and musketry from the ramparts, and from the summits of the breaches, in the repeated and fruitless attempts to carry which, the assailants were falling in vast numbers every moment. The 3d division having at length, after sustaining a dreadful loss, gained possession of the castle by escalade, and the 5th division having penetrated into the town by the same means, and also possessed themselves of Fort Pardalleras, the French were forced to retire from the breaches, by which the fourth and light divisions with difficulty entered the town. The French governor retired to Fort San Christoval, with some hundreds of his men; but on finding that the town and castle were in possession of the allies, he surrendered. In this manner fell Badajos, after perhaps as desperate and destructive a struggle as the annals of history afford, considering the numbers employed in the attack and defence. Never were troops exposed to a more terrible fire, or placed in a situation where their sterling qualities were put more to the test. Every regiment employed suffered exceedingly, both in the storm and in the arduous duties of the siege. Amongst the many whom our regiment had to lament, was Major O'Hare, who fell in the breach. The service boasted not a more truly gallant soldier. Marshal Soult was marching from the south to the relief of Badajos; but his movements were too slow, and he retired towards Seville on receiving intelligence of its fall. The Dukes of Dalmatia and Ragusa were most completely outwitted, deceived, and disappointed—one by losing Ciudad Rodrigo, and the other Badajos. Two frontier fortresses of vast importance were laid siege to in winter, in the teeth of the French armies, and wrested from them in a most skilful manner.—*Colonel Leach's Memoirs*.

A VISIT TO MOUNT ETNA.

It was a fine evening in April. I was walking in Messina, watching the deeper and deeper shades of purple that were let down upon the opposite mountains of Calabria. The long-winged *sparonaras* (or *feluccas*) were slowly moving past. The vesper bells were tolling. The people were doffing their caps, and muttering their *Ave Marias*; and the swallows were skimming about, high in the air, to enjoy the sunshine which was still reflected from the golden cross of the cathedral.

As I was thus sauntering about, I met one who had been my fellow-passenger from Naples; and finding that he was to sail in a few hours for Catania, I was easily persuaded to accompany him, as he assured me that the wind would keep fair, and we should have a fine passage. Luckily my passport bore the requisite "*buon per andare*," and the mule on which I meant to perform the journey was not engaged. Going on board before midnight, I found myself in sole possession of a bed under a tilt or arched canopy, which occupied the high and narrow poop. As I lay down, I saw the custom-house lamps shining on the water, and could perceive the dim separation of earth and air, somewhere far above the town. We soon got under weigh; the castle on the right glided past, and we moved on,

With the solid darkness black
Closing round the vessel's track.

I shall never forget the scene that burst upon me next morning. The bright blue water was rolling at my feet; and, from my little ark, I saw old Night retiring into the deep mountain recesses, while a multitude of crag-built towers were coming out into the day-light on the far-projecting precipices that alternated with the ravines or water-courses by which that bold rugged coast is finely intersected, as far as Jaormina. The wind now freshened, and the "*turriti scopuli*" galloped off to Messina; while, with rising spirits, our little bark rushed onward to its destination. Jaormina closed this part of the shifting panorama, and Etna was rapidly disclosed, rising in a long unbroken sweep, till all its regions were visible, from the coal-black lava on the beach, to the sunlit smoke that overhung the crater. As we advanced, the swell increased. A dinness came between me and the shore—my enthusiasm abated—I grew cold; and, stretching myself out in my moving dormitory, saw now the sun-clad summit, and now a fishing-boat or two beating up against the wind.

We passed the rocks of the Cyclops, and landed among a crowd of friars, worthy representatives, and, I dare say, lineal descendants, of those ancient, foul-feeding, lazy thieves and cannibals. Each held in his nasty paw a long reed, to which was attached an open-mouthed bag, which its barefooted, rope-cinctured, brown-gowned owner kept thrusting impudently in the faces of the poor fishermen, for some of their anchovies. It was a painful spectacle, and I followed a guide to an inn, well known to all Sicilian travellers. I forget its name, and the name of its courtly and ever-smiling host; but I hope they still flourish in front of the elephant-supported obelisk of the fountain of the Great Square.

Our voyage had been prosperous. It was still early in the day; so, having changed my dress and breakfasted, I wandered through the town to the lava beds below. Nothing could be more appalling; and poor Catania looked for all the world like a beautiful child, who had sat down in the very race-course of the fiery-footed steeds, to be trampled to death at the next heat.

A pretty severe illness confined me to the house for the next two days, and produced a revolution in my plans. I gave up all thoughts of going farther, and only deliberated whether I had strength to make out the ascent and return in time to catch the steam-boat. I resolved to try; and having completed my few preparations, and taken leave of an excellent family, whose kind attentions and easy manners gave me a most favourable impression of the Catanese, I set out at noon on a very good grey horse, with a boy on a mule, and reached "San Nicoloso," a wretched place, between the cultivated and woody regions, about an hour and a half before sunset. This gave me time to visit Monte Rosso, hard by—the crater of the eruption of 1669. On coming back, I found a young Englishman, who had just arrived from Aci, with an intention to ascend. We agreed to go together—engaged a guide and fresh mules—dined on boiled fowls and rice—slept two hours—took a cup of coffee—and, about eleven, sallied forth.

The air was serene; the stars were shining brightly, and every thing gave promise of a fine morning. We first crossed a tract of volcanic lava, in which our mules sank deep at every step, and then entered the woody region, as we guessed by the thinly scattered trunks of great trees among which we seemed to be winding our upward way. On emerging from this "*sclava obscura*," the acclivity became steep and rough, the darkness more profound, and we could scarcely distinguish one another, though we rode so close that the nose of each mule almost touched his leader's tail. The stars, now burning more dimly, looked large and unlike themselves—while, through the subjacent loom, we descried only some lights of a darker red. It was altogether strange, mysterious, and sublime. We spoke in whispers, and continued climbing, we knew not where or how, till we gained the edge of a field of snow. Here we dismounted, and, leaving our mules in charge of our guide, followed the other on foot. The snow was hard and firm, the ascent much less severe, and as day began to break, we passed the Tower of Embedocks, and by and bye reached the "Casa de Inglesi." Having rested there, and taken some of our bread and wine, we set out to scale the crater. Our guide now muttered, "*Malnedito Sci-rocco*," and shook his head, when we spoke of an extensive view. It was such a calm grey morning as with us betokens a fine day, and we endeavoured to sustain our hopes.

The snow had now given place to a dry, cineritious crust, and a short walk brought us to the base of the cone. Our toil here became severe, and we discovered that there were very peculiar sensations belonging to a promenade at an elevation of eleven or twelve thousand feet.* We gasped for breath, and lay down every few minutes—rose and scrambled up a little farther—sank exhausted—and it was only by mutual encouragement, and a strong determination to make it out, that we were enabled to get to the top.

It was now past sunrise, but our view did not extend more than half-way down the hill. This was a disappointment, and yet we did not regret our toil. Nay, I am not sure that the obscurity, by leaving so much for fancy to fill up, did not rather enhance the pleasure we felt as we sat on the very edge of that vast chimney, with nothing but a dense column of smoke on one hand, and the uniform haze that covered earth and air on the other. After communing with our thoughts in silence for about half an hour, we commenced our descent, and, by the middle of the day, regained the Osteria of San Nicoloso. As we got down, the heat grew insufferable. The air was like molten brass; and the young leaves of some unfortunate vines which they had planted there drooped as if they had been boiled. We rested ourselves by a short siesta—dined—shook hands—and set out in opposite directions.

The evening was still very hot, but the haze cleared away sufficiently to let me see the flower-enameled fields, the immense sheets of cherry blossoms, the cavern retreats of the Cyclops, and all the haunts of Aci and Galatea. Gigi, to whose orders I submitted myself, allowed me supper, and a few hours' rest at the same place, and we entered Jaormina early next morning, before many of the inhabitants were stirring. The theatre was the only thing I wished to see, and Gigi, though averse to the delay, yielded with a good grace, and we rode round to it. But here I must break off.—*Edinburgh Spectator*.

BUTTONS.

This beautiful ornament appears with infinite variation; and though the original date is rather uncertain, yet we well remember the long coats of our grandfathers covered with half a gross of high tops, and the cloaks of our grandmothers ornamented with a horn button nearly the size of a crown-piece, a watch, or a John-apple, curiously wrought, as having passed through the Birmingham press.

Though the common round button keeps on with the steady pace of the day, yet we sometimes see the oval, the square, the pea, the concave, and the pyramid, flash into existence. In some branches of traffic the wearer calls loudly for new fashions; but in this, the fashions tread upon each other, and crowd upon the wearer. The consumption of this article is astonishing; the value in 1781 was from threepence a gross to one hundred and forty guineas.

In 1818, the art of gilding buttons had arrived at such a degree of refinement in Birmingham, that three pennyworth of gold was made to cover a gross of buttons; these were sold at a price proportionably low. The experiment has been tried to produce gilt buttons without any gold; but it was found not to answer, the manufacturer losing more in the consumption than he saved in the material. There seem, says Mr Hut-ton, to be hidden treasures couched within this magic circle, known only to a few, who extract prodigious fortunes out of this useful toy, whilst a far greater number submit to a statute of bankruptcy. Trade, like a restive horse, can rarely be managed; for where one is carried to the end of a successful journey, many are thrown off by the way.

* There is a little mistake in this reckoning. The very summit of Mount Etna is not more than 10,160 feet above the level of the sea.

TAMMY LITTLE.

BY WILLIAM TENNANT.

Wee Tammy Little, honest man!
I kent the body weel,
As round the kintira-side he gae
Careerin' wi' his creel.

He was sae slender and sae wee,
That aye when blasts did blaw,
He ballasted himself wi' stanes
'Gainst bein' blawn awa.

A meikle state the wee bit man
In likka coate-pouch clappit,
That by the mighty gowd wi' wind
He michtna down be swappit.

When he did chance within a wood
On simmer days to be,
Aye he was frichtit lest the craws
Should heise him up on hie;
And aye he, wi' an aiken cud,
The air did thump and beat,
To stop the craws frae liftin' him
Up to their nests for meat.

Ae day, when in a barn he lay,
And thrashers thrang were their,
He in a moment vanisht aff,
And nae man could tell whair.

They lookit till the riggin' up,
And round and round they lookit,
At last they fand him underneath
A friot cruyled and crookit.

Ance as big Samuel past him by,
Big Samuel gave a sneeze,
And wi' the sough o' he was cast
Clean down upon his knees.

His wife and he upon ane day
Did chance to disagree,
And up she took the belowswes,
As wild as wife could be;

She gave ane puff intill his face,
And made him, like a feather,
Flee frae the tae side o' the house,
Resoundin' till the tither!

Ae simmer e'en, when as he through
Pitkie forest past,
By three brae leaves, blawn aff the trees,
He down to yird was cast;

A thirl o' wind the three brae leaves
Down frae the forest dang,
Ane frae an ash, ane frae an elm,
Ane frae an aik-tree strang!

Ane strak him sair on the back-neck
Aie on the nose him rappit,
Ane smote him on the vera heart,
And down as dead he drappit.

But, ah! but, ah! a drearier doom
Ane hapt at Ounston-dammy,
That heid'd him a' thegither up,
And maist extinguish'd Tammy;

For as he came slow-daunderin' down,
In's hand his basket hingin',
And staver'd ower the his road's breidth,
Frae side to side a-swingin'!

There cam' a blast frae Kelly-law,
As bald a blast as ever
Auld snivelin' Boreas blew abraid
To make the world shiver.

It liftit Tammy aff his feet,
Mair easy than a shavin',
And hurl'd him half a mile complete
Hie up 'tween earth and heaven.

That day pur Tammy had wi' stanes
No ballasted his body,
So that he flew, maist like a shot,
Ower corn-land and ower cloddy.

You've seen ane tumbler on a stage
Tumble sax times and mair,
But Tammy weel sax hundred times
Gaed tumblin' through the air.

And when the whirly-wind gave ower,
He frae the lift fell plumb,
And in a blink stood stickin' fast
In Gaffer Glowr-weel's lum.

Ay—there his legs and body stack
Among the smotherin' soot;
But, by a wonderfu' good luck,
His head kept peepin' out.

But Gaffer Glowr-weel, when he saw
A man stuck in his lum,
He swar'd wi' drither clean awa,
And sat some seconds dumb.

It took five masons near an hour
A' riving at the lum
Wi' picks (he was sae jamm'd therein)
Ere Tammy out could come.

As for his basket—weel I wat
His basket's fate and fa'
Was, as I've heard dounce neighbours tell,
The queerest thing of a'.

The blast took up the body's creel,
And laid it on a cloud,
That bare it, sailin' through the sky,
Right ower the Firth's braid fold.

And when the cloud did melt awa,
Then, then the creel cam' down,
And fell'd the town-clerk o' Dunbar
E'en in his ain good town.

The clerk stood yelpin' on the street
At some bit strife that stir'd him,
Down cam' the creel, and to the yird
It dang him wi' a drom!

THE EPITAPH FOR TAMMY.
O Earth! O Earth! if thou hast
A rabbit-hole to spair,
O grant the graff to Tammy's corp,
That it may nestle thair;

And press thou light on him, now dead,
That was sae slim and wee,
For, weel I wat, when he was quick,
He lightly prest on thee!

—*Edinburgh Literary Journal*.

EDINBURGH: Published by WILLIAM and ROBERT CHAMBERS, Booksellers, No. 19, Waterloo Place; and sold by all Booksellers in Edinburgh and every other town in Scotland.—Agent for Glasgow, JOHN MACLEOD, 20, Argyle Street.

Subscribers in town may have the Paper left at their houses every Saturday morning, by giving their addresses at 19, Waterloo Place. Price of a quarter of twelve weeks, 1s. 6d.; of a half year of twenty-four weeks, 3s.; and of a year, 6s. 6d. In every case payable in advance.

In LONDON, an Edition is published, with the permission of the Proprietors, by WILLIAM ORR, Paternoster-row, for circulation throughout England and Wales.

Typography executed by W. and R. CHAMBERS; stereotyped by A. KIRKWOOD; and printed by BALLANTYNE and COMPANY, Paul's Work.

CHAMBERS' EDINBURGH JOURNAL

CONDUCTED BY WILLIAM CHAMBERS, AUTHOR OF "THE BOOK OF SCOTLAND," &c., AND BY ROBERT CHAMBERS, AUTHOR OF "TRADITIONS OF EDINBURGH," "PICTURE OF SCOTLAND," &c.

No. 28.

SATURDAY, AUGUST 11, 1832.

PRICE THREE HALFPENCE.

NO CEREMONY.

IF you were to poll society, you would find nine out of every ten profess their utter dislike of all ceremony. Take them at their own word, they are the most downright, unaffected people in the world; but see them in the practice of life, and they turn out to be as full of airs and as much offended at any little omission of the punctilious homage due to themselves as may be. It seems as if we were under a constant wish to get back to nature and simplicity, but as constantly checked in every effort to that effect, by the powerful bonds which a state of society has imposed. We would all fain be the easy, pleasant, happy children which we think we once were, instead of the cold, artificial, heartless beings which we think we now are. But in feeling thus, we forget that when we were children sporting with each other, we were perpetually giving and receiving offence, from rudeness of behaviour among ourselves—in other words, from the want of a conventional system of respectful manners—and that thus we were often the most unhappy wretches in the world, frequently snarling at each other, sometimes getting sound thrashings from our offended companions, and sometimes giving them, perhaps for very little fault; and, in general, only prevented from being rude and riotous, nay, sometimes, from being rank spoliators and oppressors, by the fear of punishment from a stronger hand.

If the world were only gratified in its general desire of abjuring ceremony for one day, by way of experiment, it would soon, I apprehend, find the necessity of returning to a decent degree of affectation. Suppose a respectable gentleman going abroad that morning, full of the idea of doing all kinds of things in an easy way, as he used to do when a boy. He sees an old schoolfellow a little way before him on the street, and thinking it a good joke, runs up and knocks the hat off his head, making it spin far into the highway, and then turns about and laughs in the face of the injured party. The *jokee*, however, has a different idea of the matter from the *joker*; and whereas in schoolboy days it would have been settled by a slight pomelling, rendering them rather sulky with each other for a day or two, nothing less will serve in these rational days of adolescence than a regular interchange of shot at each other, at the distance of twelve or nine paces, as the case may be. Suppose two ladies, intimate friends, meeting on the street. One admires the other's bonnet immensely, and, as might have happened long ago in the case of a pretty cap for a doll, she endeavours to snatch it from her friend's head. The other, however, defends her property at the point of the parasol, and the end of the joke is, that the two are taken to the police-office. Suppose a dinner party meeting in the afternoon of this unceremonious day, if the day has lasted so long without a return to good breeding. Instead of each gentleman conducting a lady to the dining-room, which is a horrid piece of affectation, the whole male sex goes trooping off, in an easy candid way, leaving the women to come trolloping after. Of course, the respect of the men for the women is not increased by seeing them come in at the door pell-mell like a drove of sheep; and therefore there is the less disposition to accommodate them with seats, or to serve them with food. The fair part of the company soon become quite indignant at the men, and attack them with all the virulence of the ancient harpies. A scene ensues which there is no describing. The greatest confusion prevails. There is a squabbling of tongues enough to deafen Babel or Billingsgate. The air is darkened with flying plates and candlesticks. At last, within ten minutes after the ringing of the dinner bell, the ladies are seen pouring out of the house like enraged bedlamites, some with their bonnets and shawls, and more without them, and the want of a little ceremony is found to have

"—broke up this mirth, married this good meeting, With most admired disorder."

In every department and contingency of life, the same results are experienced, so that before night the human race at large seems as if it were about to revert to the savage state.

Perhaps this is a somewhat exaggerated picture of what might be, in the event of all ceremony being abjured. It will be the more apt, however, to impress the reader with a sense of the absurdity of perpetually disclaiming ceremony. Preserve, if you are wise,

a certain degree of ceremony, as it is called, with all persons, even the nearest relatives; for though it may be in itself a kind of hardship, as being a departure so far from the dictates of natural and real feeling, it is the preventive, you may depend upon it, of much greater evils. Taking off the restraint of ceremony from the most of minds, is like unmuzzling the apparently tame tiger in the midst of a drawing-room. By far the greater number of people, thus permitted to do or speak according to their random emotions, would do such mischief as years of formal harmlessness would not repair. Besides, to be always saying "no ceremony," is not the most polite thing in itself towards those to whom it is addressed—it seems to imply that we are afraid of their being over formal. It is calculated, indeed, to have quite the contrary effect to what is intended, by reminding the prisoner, as it were, of his chains. As to tell a man to be merry, is the surest way to make him sad, and to ask any body to commence a conversation with you, is the most certain way of causing him to have nothing to say, so is the request that he will make no ceremony the readiest plan for putting your friend upon his p's and q's. Let things go on in an easy natural way, as if you were not conscious that there was such a thing as ceremony, and you will be sure to find that there is no undue stiffness. Cherish good feelings towards all mankind—kind feelings towards all with whom you are acquainted; and if you have no desire of offending, it is ten to one but you render all happy around you. You may entertain as much dislike as you please for *fantastically* artificial and polite manners; but you may depend upon it, that a moderate observance of the conventional rules of society is in reality the kind of behaviour most agreeable to the natural emotions and sympathies of a good mind, the whole being founded on a principle akin to a primary maxim in ethics—namely, speak to others as you would wish others to speak to yourself.

INSINUATION OF CHRISTIANITY INTO PAGAN MINDS.

AN intimate acquaintance with human nature in all the circumstances under which it displays itself—from the wigwag of the savage, who has no further aim than to support existence, to the study of the philosopher, whose investigations are directed to the nicest subtleties of the schools—is one of the effects which Christianity has produced among those who profess it, which could have been produced by the influence of no other known creed. The cause of this is plain. No one who knows the value of its precepts but wishes to see them more widely extended. Wherever the Christian meets a person ignorant of the benign doctrines of his own faith, a desire of imparting them sets him upon considering what are the best means of doing so. He examines not only the arguments by which they may be supported, but those by which the tenets of the man whom he is anxious to convert may be most successfully assailed; and in order to do this, he must acquire a knowledge of these tenets, of the sources whence they have been derived, and of every thing in the character of him who believes them which strengthens their hold upon his mind, and which must be combated in persuading him to shake them off. In this manner is undertaken a moral campaign, so to speak, in which the professor of another religion has no inducement to engage. The same thing takes place on a wider scale when an intercourse is opened with a country where the truths of Christianity are unknown. The missionary goes to work with the greatest industry; he makes himself acquainted with the religion of a people, with the people themselves, their dispositions, habits, and the extent to which intellectual cultivation has been carried among them. He comes in contact with men of every capacity, modified by every possible variety of circumstances; and independently altogether of the end in view, the mental discipline, as regards himself, and inquiry as regards others, which are thus kept in constant activity, have disclosed much in the science of mind that we should have had an opportunity of learning in no other way.

This Mahometan cannot attain the same knowledge in this respect which the Christian possesses, for he proselytises by violence, and has no occasion to under-

go the same course of study. The heathens of old could not arrive at it, for their religion consisted in the observance of rites rather than in any fixed belief, and they were fully more ready to adopt new gods than to extend the worship of their old ones. The Romans, for example, before invading a country, often invited all the gods of it to transfer themselves to Rome, without troubling themselves about the nature of the deities whose alliance they courted; and then, as they imagined, or at least caused their armies to imagine, advanced to certain victory over the unprotected natives. Where they inquired at all concerning the superstitions (as they called all religions but their own) of the conquered tribes, it was only lest any thing should exist in them tending to promote hostility against the majesty of the Roman name. This was the object of Pliny in his investigations concerning Christianity; and that, at an earlier period, the governors of Judea acted upon the same rule, appears from the fact, that when the Jews had agreed among themselves that our Saviour was guilty of blasphemy, they did not accuse him of that crime before Pilate, but charged him with a political offence.

But perhaps some may think curiosity would induce the Romans, and would have induced us, to acquire a correct knowledge of the religion of other countries. Curiosity, however, is satisfied with a comparatively superficial knowledge. Of the truth of this remark we find a striking example in the treatise of Tacitus, *De Moribus Germanorum*, where the religion of the people is disposed of in a short paragraph. After mentioning that they worshipped Mercury, Hercules, and Mars, he adds, that they did not think it consistent with the character of the celestial existences to confine them within walls, or to form figures of them in a human shape, but consecrated groves and woods, which they called by the names of their deities, and visited with deep reverence. This is just the degree of knowledge that curiosity would pick up.

The persons from whom Tacitus derived his information, observing no temples among the tribes of Germany, were probably struck with surprise at the singularity of the circumstance, and asked some blue-eyed savage if his countrymen acknowledged no gods. The German would reply by an enumeration of the deities above mentioned. The next question would be, "Where are their temples—their images?" and it would draw forth the explanation concerning the Druidical groves, and the want of any material representation of the objects of worship. These were the points in which the German practice differed from that of the Romans; and when they were explained, the curiosity of the invaders was satisfied. If they had observed statues and temples, it is possible enough they might not have thought at all of inquiring to what gods they were dedicated, or what the rites of worship were. Contented with the single piece of information that the Germans really had a religion of some sort, the Romans proceeded no farther in their interrogations; entered into no discussion for the purpose of discovering what hold his religious opinions had upon the mind of the German, or whether it might not be possible to improve him by communicating a better system of morality. All the dreary expanse of intellectual darkness over which superstition exerts her sway was left unexplored, for the proud Roman enjoyed no brighter a day than the poor barbarian. His ideas of civilisation had relation merely to those contrivances which minister to the comforts of the present life, and he might despise, or perhaps pity, the German, on account of his inferiority in these respects; but the conqueror had not the power, even if he had felt the inclination, to assist the conquered in forming better conceptions of the Deity. He had no motive but curiosity to direct his inquiries concerning the religious opinions of others; and we have already seen how very short a way that motive carried him.

By way of contrast to this, and in illustration of our opening remark, it may be worth while to look back upon that time when the vast regions of America had been recently disclosed to the European adventurer, and to observe the degree of attention that was turned to the religion of the native tribes; and whether the inquiries on that subject did not incidentally disclose a view of the mind of man in its savage state beyond comparison more accurate than the conquests of the Romans ever opened to them. This object will be

best accomplished by taking the relation of one of the missionaries for our guide, and touching upon a few of the details which his personal experience furnished. The narrative we shall use is that of Hennepin, a monk of the Franciscan order, who spent several years in the then French colony of Canada, and who had also been present in various excursions, made with a view to establish settlements in other parts of the country. He claims credit for being one of the first who described in Europe the Falls of Niagara, and he sailed in the first vessel navigated by Europeans—indeed, the first vessel larger than a canoe that had ever been launched—upon the American lakes, when, as he tells us, “the savages of that vast continent were astonished to behold that fortress moving from one nation to another; and when they heard the noise of the cannon which we carried with us, they cried out that the thunder was about to strike them.”

Father Hennepin seems to have laboured in his vocation with more zeal than was pleasing to those who were associated with him. He makes no scruple of confessing the difficulties that lay in the way of converting the heathen, and the small progress that had in his day been made in enlightening the natives of America. This unaffected earnestness and candour on his part was so little agreeable to the Jesuits and others, who were content with nominal converts, and were studious to circulate at home overcharged accounts of the efficacy of their exertions, that Hennepin found it advisable to retire from France, and published at Utrecht, in 1698, the work from which our materials are extracted.

All savages who have any notion of a heaven seem to agree in making it merely a better sort of earth; they differ only in ascribing to it the characteristics of the country they inhabit. The Canadian supposed heaven to be a place affording plenty of deer in better condition and more easy to be killed than those he was accustomed to pursue. The Greenlanders, on the other hand, imagined the joys of Paradise to consist chiefly in this—that an immense caldron would be kept constantly boiling, from which every one might take as much seal-blubber ready cooked as he wanted. In conformity with these prevalent ideas, when Europeans first appeared in the Indian villages, the natives received them as “ghosts permitted to review this world;” talked of them by the name of “spirits,” and sometimes ventured to inquire concerning the welfare of their deceased relatives, and if they liked the other world well—according to their belief that the dead merely go to inhabit a different part of the globe, where the manner of life is somewhat happier, and hunting less toilsome and more successful than among themselves. After a little intercourse, the savages began to have some notion that the Europeans were a kind of mortals, but still looked upon them as of a nature and destiny entirely distinct from their own. When the priests talked upon religious topics, the Indians listened with the greatest attention, and granted implicit credit to whatever was told them; but then they had their own story to relate in return, and were both disappointed and offended when its truth was questioned. One of the Fathers, trying to persuade a man to become a Christian, expatiated upon the joys of heaven, but was stopt by the savage, who inquired if there was good hunting in the place he mentioned. The priest answering in the negative, the Indian thereupon shook his head, and said that such a place might probably do very well for the people beyond the Great Lake, but it would not suit him. This was the turn, indeed, that was generally given to every conversation with them on the subject of a future state, as well as other topics of a religious nature. Father Hennepin having endeavoured to explain what is taught in the Bible concerning the creation of the world, his hearers readily professed that they had no doubt of the truth of the account; but they only received it as referring to that part of the world from which he came, and he was forthwith called upon to acquiesce in the following legend, by which they accounted for the same event as far as related to their own portion of the globe.

“They told me,” he says, “that a woman descended from heaven, and remained some time poised in the air, without finding any rest for the sole of her foot. The fishes of the sea took compassion upon her, and consulted among themselves which of them should receive her. The tortoise presented itself, and offered its back above the water, and the woman stepped upon it, and took up her residence there. In the course of time the refuse of the sea gathered about the tortoise, and formed a great extent of land.” This fable affords a curious example of the imperfect notions entertained in a savage state of society, assigning as it does a beginning to the land, and supposing the ocean and its inhabitants to have pre-existed. It had occurred to them that the earth which they daily trode must have been created as well as themselves; but their thoughts had not travelled beyond what was offered to their immediate attention, nor endeavoured to find a cause for the existence of water, still less for that of the viewless air. Perhaps the legend ought to be considered a mixture of obscure traditions concerning the creation and the deluge. We find some traces of the history of Cain and Abel in the sequel. “They believe,” Hennepin proceeds, “that this woman [who descended from heaven] had two sons, who, when they grew up to manhood, fell at enmity. The one was a better hunter than the other; and quarrels took place between them daily. One of them was

of a fierce temper, and cherished a mortal hatred of his brother, whose disposition was milder. At last matters came to such an extremity that they could no longer live together; the milder of the youths was obliged to abandon the earth, and, retiring to heaven, called thunder to his aid, which he employed from time to time to frighten his fierce brother.”

The refusal of the missionaries to believe the Indian fables, and their extreme eagerness to make the natives renounce them, perplexed the latter greatly; nor were they less surprised by the alterations recommended in regard to their customs and behaviour. Being in the practice of putting away their wives and taking new ones whenever they found such steps convenient or agreeable, they could by no means be brought to comprehend the propriety of making their marriages indissoluble. “Do you not see,” they said, when argued with on this subject, “that my wife is not pleased with me?—I am not pleased with her; she would agree better with my neighbour—his wife with me. Why would you have the whole four to be made wretched for the rest of our lives?” Where any change of their habits was proposed in points similar to this, the Indians resolutely refused assent; but in all indifferent matters they gave a ready compliance. “When,” Hennepin remarks, “we said to them, ‘Pray to God with me, my brother,’ they did so, and repeated, in their own language, word for word, the prayers which we taught them. ‘Throw yourself upon your knees,’ they kneeled; ‘take off your cap,’ they uncovered; ‘be silent,’ they held their peace. If we said to them, ‘Listen to me,’ they listened with the greatest attention; and if they were presented with crucifix or beads, they used them like trinkets for ornament, as if they were made of common glass or porcelain. When I told them it was Sabbath, or the day of prayer, they answered, ‘Niaouâ’ (very well). I sometimes requested them to promise to the great Lord of life not to get drunk any more; they replied, ‘Netho’ (yes, I promise; I shall not fall into that sin).’ The missionaries, when they saw this extraordinary docility, imagined they should make great progress in the work of conversion, but a short time sufficed to convince them of the fallacy of this expectation. Those savages who had been baptised, having submitted awhile to the restraints of a settled mode of life, under the superintendence of the missionaries, when the whim was over, went off to the woods, and resumed all their old habits. Seeing the eagerness of the priests to baptise, they began to suspect that that ceremony was a spell whereby they should be compelled to become the slaves of the whites in the next world. They submitted to it willingly, nevertheless, if presented with a glass of spirits or a pipe of tobacco; but then they wanted to bargain for its repetition on the same terms; and when they understood it could only be performed once, they offered their children, themselves claiming the solatium.

“This,” proceeds Father Hennepin, “was the cause of dreadful alarms of conscience to our missionaries, at the commencement of their labours among the people of Canada. They saw that the few adults whom they had instructed, and afterwards admitted to the sacrament of baptism, soon fell back into their former indifference for the things which concerned their salvation, and that the children followed the example of their parents, so that the rite of baptism was visibly profaned by being administered to them. The case was examined to the bottom, and discussed with much anxiety. It was even carried before the Sorbonne; and, finally, after all possible attention, determined, that with respect to adults and children on the point of death, and of whose death there should appear a moral certainty, the missionaries might venture to administer baptism when it was desired; but that other savages were not to be baptised, unless long and close observation should have proved that they were really penetrated with the truth of our mysteries, and completely detached from their own barbarous customs. A formulary was prepared, and a sort of fundamental canon to serve as a rule to our missionaries, and to which they should strictly conform in the performance of their functions.”

Hennepin had these regulations to go by, and, though he laboured to enlighten all, admitted to baptism only such as the decision of the Sorbonne pointed at. “One day,” says he, “I baptised a little child, which appeared in certain danger of death. The next day it got better, contrary to my expectation. Some time afterwards its mother related to other women, in my presence, in what manner I had cured her child. She took me for a sorcerer, and declared that I was an excellent one, who could cure all kinds of diseases by throwing water upon the head and temples. The native conjurers became jealous of me, in consequence of what this woman said, and began to spread reports that I was of an austere and gloomy temper, that I lived upon snakes and poison, and ate thunder (!) adding that the Europeans had tails like brutes, and

• An Indian courtship, if this author’s account of it be correct, must have afforded a strange contrast to the European mode: “The savage who is not married,” he says, “goes to a girl who is not married either. He says to her, without preface or circumlocution, ‘Will you come with me and be my wife?’ She makes no immediate answer, but meditates some time, holding her head between her hands. While she is considering what to say, the man holds his head between his hands also, and remains in profound silence. After the girl has thought a while, she says, ‘Netho,’ or ‘Niaouâ,’ which signifies ‘I agree.’ The man then rises and says, ‘One,’ that is, ‘Well, it is done.’ At night the woman takes a hatchet, cuts a burden of wood, and carries it to the hut of the savage.”

many other ridiculous stories; for these impostors were afraid that I should make them lose their credit, and so deprive them of many a good feast. The people listened with astonishment to these unfounded stories, and being simple and easily deceived, began to look upon me with suspicion; afterwards, when one of them fell sick, they came to demand if I had not poisoned him, declaring they would kill me if I did not cure him. I had great difficulty in undeceiving them, and was obliged several times to appease them by presents of knives, needles, awls, and similar trifles, of little value amongst us, but which the savages estimate highly.” Another trait of the simple ignorance of these poor creatures, upon a similar occasion, is as follows:—“They have some conception of the immortality of the soul. They say that there is a most delicious country towards the west, where there is good hunting, and people kill as much game as they please. Thither, these blinded people say, souls go. They hope to see each other all again in that place. But what is very absurd is their assertion that the souls of pots, flints, firelocks, and other arms, which they place near the sepulchres of their dead, go along with them, and serve the same purposes in the land of souls as they do here. One day a savage girl died after baptism, and her mother, who had a slave then at the point of death also, came to me and said, ‘My daughter must be quite alone in the country of the dead among the Europeans, without acquaintances or friends. It is now spring time, and she must plant some corn and pumpkins. Baptise my slave before she die, that she also may go to the place to which the souls of Europeans go, and assist my daughter.’”

A few such simple traits as these disclose to us a more intimate view of the mind of man in his uncivilised condition, and, consequently, establish a better foundation for our inquiries concerning the improved state of the intellectual faculties, than any heathen philosopher had the power to attain. Hennepin gives a more lively picture of savage life than Tacitus, with his infinitely superior abilities, could do. And it would have been the same had civilisation continued among Pagan empires to this day. These were in their whole characters, as communities and as individuals, grasping; they aimed at power in one shape or another, without reference to the improvement of those whom their arms subdued. The love of dominion is indeed not yet extinguished among men; but conquests cannot be extended without carrying along with them a diffusive principle—the elements of ultimate amelioration.

THE ROCKING.

On Fasten-e-en we had a rocking,
On ca’ the crack and weave our stocking;
And there was muckle fun and joking,
Ye needna doubt:
At length we had a hearty yoking
At sang about.

BURNS.

The name of rockings was long given to meetings held in the winter evenings among the peasantry, for the purposes which Burns has explained in the prefixed motto. Even after that species of industry, which had been once practised at these meetings, and from which they received the name,* was discontinued, they retained the appellation, and those who frequented them, at the same time that they enjoyed, in their sphere, the pleasures of social converse, exercised themselves in such operations of thrift as employed the hands without requiring the mind to be constantly fixed. After the labours of harvest were finished, the last cart-load of grain driven home, the *stackyard* *gett shut*, and every comfort provided against the approach of winter, the young men and women of a vicinage went round to one another’s houses, and spent together the hours betwixt nightfall and the time of retiring to rest, which received the name of the *fore-suppers*. These meetings served a variety of purposes. They tended to enliven the dreariness of the season, by calling into exercise the social feelings of a neighbourhood. They afforded an excellent opportunity for disputants on religious and other topics to display their skill and information—and thus cherished the spirit of intelligence among the Scotch peasantry; and they were the schools for the preservation of traditional tales, ballads, and songs. But above all, the rocking served as places of rendezvous for rural wooers—a sort of lesser festivals between the grand gala-days of fair and preaching. Many a man travelled five miles on a bitter winter night, under pretext of anxiety to have a “crack” with the elder, when his real purpose was to get a sight of the elder’s fair daughter; and many a man gave an ear to the elder’s discussions upon points of doctrine and points of worldly economy, for four mortal hours, that he might have an opportunity of whispering a single word to the elder’s daughter as he wrapped his plaid round him to depart. Many great changes have been made upon the manners and habits of the Scotch common people within these thirty years. With other customs, which it is as well that they should have abandoned, they have laid aside some that it were, perhaps, to be wished they had retained. Amongst these are the rockings. In most parts of the country, only those who have reached to old age, or its confines, can tell what a rocking means. The name is lost; and though the practice of mutual visitings is still common to a certain extent, it has acquired more

• Spinning from the simple distaff, or *orrock*; exclusively, it is to be remarked, a female employment.

of formality, and lost some of that forthright spirit of good neighbourhood which formerly distinguished it, when people came uninvited, and were welcome.

"But to our tale." Somewhere about fifty years back, a rocking was held in the farmhouse of Hapcarton. The kitchen was the principal apartment in the dwelling as it then existed:—a handsome tenement, containing drawing-room, dining-room, parlour, and five bedrooms, besides kitchen, cellar, and other accommodations, which render it a fitting residence for a gentleman farmer, or a proprietor who wishes to reside on his own land, all as set forth in the advertisements, has since been erected; but the kitchen was the principal apartment then. There was another division of the house called the bend-end; but it was used merely as a storeroom for household goods not in immediate use. The only partition was a range of low wooden bedsteads, or bedcases rather, above which was stored lumber of every sort. Ceiling there was none; but the roof, a spacious dome gilded with a janneping of soot in a half liquid state, opened above. Where a straw hung from the rafters, it was invested with a profusion of sable flakes, as blades of grass are loaded with rime on a frosty morning; these, during a high wind, descended plentifully among the inmates. Though the fire was placed so directly under the chimney that the rain in bad weather kept every one at a distance from it, the smoke never could find its way out; it curled up to the roof-tree, eddied along, fell lower and lower, till the house was filled, and then issued by the door. The thatching over the door (and this may still be observed in cottages upon the old plan in Scotland) was always dusky with soot from this cause. Food among the peasantry is almost wholly prepared by boiling; and while this process was going on, the lid of the vessel, when lifted off, was suspended over it to intercept the soot which the motion of boiling shook down from the chimney; and the *bussing*, or head-dress of the female (usually the goodwife herself), who superintended this part of the domestic affairs, was always abundantly bedropped with spots of a tawny yellow. Mutton hams, carefully wrapped up in cloths to preserve them from the prevailing contagion, depended in tiers round the brace, and kippers but lately transferred from the cool brooks to these arid regions, were hung up among them, the whole presenting the promise of many future savoury morsels. So much for the scene of our story.

The men sat upon chairs and wooden stools round the fire, the wires of the knitters performing their operations with wonderful rapidity, though those who handled them seldom looked at their work: while the lasses, "bonny witches!" in modest deference, were seated farther back, birling at their wheels, and casting their jokes and their glances alternately among the group. Mighty shaggy collies stretched themselves upon the middle of the floor, while less lordly brutes skulked into corners; and the goodwife bustled about, putting things to rights, or to confusion, as might happen. The night of an October day was just closing in, and all were about to quit their work, those who were at a distance from the window (which admitted but a glimpse of day at any time, not having panes of glass, but of tanned sheep-skin) beginning to depend partly upon the flame of the fire for light; for the economy of the old style of farmers' house-keeping did not admit of candles being burnt, except during the time of supper, or when the master of the house was performing family worship.

"So, ye see," said Tam o' the Binns, who had just returned from England, whither he had gone with a drove to the sheep-markets, and was, as a travelled man, entertaining the company with some of his adventures—"So, ye see, gudeman, when the farmers cam to weir the drove off their grunde—(they're unco feared for their gerse, having but sma' mailens)—I wad say, 'A bonny bit o' land ye hae here, and strang craft craps; and thae kye, I see warrant, I haena seen mony like them;' and then it was wonderfu' to see how fain the bodies grew, and how they pointed out their marches, and what riggs were best for bigg, and what for aits, and then praised me as being a clear-reen lad, and fer-travelled, and the like. My sheep taking a nibble, ye ken, I wasna slack!"

"O Tam, Tam!" interrupted the goodwife, "ye're aye the auld man yet! Na, sirs, that's naething ava to some o' his contrivances. That very Tam o' the Binns—there he sits!—about two years syne, nailed two sticks in the shape of a cross, etting to plant it upon the rigging of Elder Gowdie's house, to vex the honest body; and sae he mounted upo' the roof. But the elder's rafters being sair dazed wi' syppings o' rain and auld age, and Tam a buirdly loon, as ye may see, he cam down upo' the floor, wi' the broken sticks and divots dunting about his lugs. It was the howe o' night, and Tam had deparit by the window-hole, before auld Johnnie, honest man, could discern whether it was beast or body, and he believed till the day of his death, which happened near a twallmonth syne—(our gudeman there gaed to the interment in spite of a' I could say till him, though it was the fearfu'lest day o' black weather that ever blew frae the cluds; mair by token, it whuppit the coomb-claith frae 'mang their hands, and flang it over the wast end o' the kirk—the gudeman was laid by wi' the rheumateeze for a month after that wearfu' day, whilk may be a warning to him to tak better heed to what's said till him for the time to come)—Weel, as I was telling ye, Elder Gowdie believed till his deeing day that our friend Tam there was the enemy, who had comed in at the tae side

o' the house and gane out at the t'other, and never tauld the story without expressing his thankfulness that he had not been permitted to injure a hair of his head, nor of that auld Rachel Williamson his wife. D'ye mind als," continued she, addressing Tam, "ye littleworn moonlighter! how ye garred our gudeman trow that his brass buckles were glenting gowd when the yaud was i' the corn?"

"Ah, but then, gudewife, I cam in har'st, and helpit to shear what she hadna eaten. And when I forgaither wi' the herds, Arthur," addressing the shepherd, "lang swabbles o' chields, you and me could swap a dozen o' them ourselves, I began to joke them about the lasses—the mair if they were but beginners—and what splores I warranted they had seen in their time. They gied me lang screeds about their plays; and though it was aye 'Bawtie this,' and 'Bawtie that,' they didna fash the drove muckle."

"And, Tam, what think ye o' the English lasses?" was the question put by one of the maidens. "Tight, weelfaured queans," was Tam's reply; "I whiles lookit at them—I couldna bide to speak to them, for they're bye ordinar glib o' the gab, and I never kenned a word they said; but they hadna the blithe blink o' the lasses o' my ain country."

A tap was here heard at the window. "The herds and heezles were alarmed" in an instant; for nothing delights rustic gallants so much as to find out whether their neighbours "a-wooin' wend," and they are equally dexterous in preventing a discovery when the case is their own, and effecting it when it is their neighbour's.

"It's just him! it's just him!" whispered bonny Babie Davison to her confidante Peggie Dunlop—"He's surely daft to chap the night." "No sae dooms daft, lass—the door's ranced," was the answer.

It seemed strange that this could have been accomplished with so little noise as not to be heard by those within, and still more without alarming the dogs, which are extremely alert in catching the slightest sound. Nevertheless, so it was; and when the rustics, eager for the pursuit, attempted to open the door, they found it was firmly secured on the outside. A boy was immediately ordered to get out by the window and undo the fastenings. This he was not willing to do, for one of the damsels had slyly suggested that there was great danger in the attempt. "I see warrant," said she, "the man's just standing at the cheek o' the window wi' a tremendous stick in his hand ready to fell ye whenever ye set out your head." It required much persuasion to overcome the boy's reluctance to encounter such a risk; and when at last the urchin consented to adventure forth, the goodwife had her joke to play off; for, perhaps from recollections of her own courtship, she had a fellow-feeling with her maidens. "Callant," whispered she, as she assisted the boy to get out by the window, "leave the sticks i' the gate, and I'll get duds to row up the broken shins, besides gieing you an orra whang o' cheese when you drive out the kye the morn."

"It's nae matter," said Babie, her alarm having subsided when she became fully aware of the precautions taken to insure her lover's safe retreat; "there's no ane o' them could hae catched him at any rate." "I wadna say that, lass," said Peggie Dunlop; "there's our herd Arthur wad the race against ten parochens." "Ay, but somebody didna rin against him," whispered Babie. "But if they couldna hae catched him, they might hae kenned him by his fleetness," said the goodwife; "and now, when I think on't myself!"

The noise at the door interrupted the good dame in her conjecture. The obstacles on the outside had been removed, the door was opened, and the eager band rushed out. A pile of stakes had been thrown in the way according to the directions of the goodwife; the foremost of the rustics tumbled over this impediment, and those in the rear over the prostrate van—the dogs leapt over their masters, barking with all their might, worried each other, and scampered over the green. No sooner had the overthrown pursuers scrambled upon their legs, than a great outcry arose against the ill-deedy knave who had thus retarded them, and who now stood aloof laughing at the success of the trick. When charged with having intentionally left the stakes in the way, he kept at a safe distance, and argued, strenuously and loudly, that the accident was wholly owing to their own impatience, and that, had they staid quietly within for a few seconds, he would have cleared every thing out of the way. There was a show of truth in this pretext, and they were obliged to give up the point. Considering also that the fugitive, if he made the best of his time, as they well knew he would, must already have escaped far beyond their reach, besides that they did not know in what direction to follow him, they returned to the house, crest-fallen all, and some of their number halting a little.

"Hech, sirs! but ye hae run a bauld race atween the tangs and the tae end o' the house," was the greeting with which they were received by the goodwife; "I e'en lookit out some bits o' linen, for I dredd there might be broken heads gaun! and maybe the duds may be usefu', for though ye haena come to handigrips wi' this midnight stravaiger, you have run against something that was mair sure to meet you."

This sarcasm, and the tittering of the maidens, put the discomfited pursuers upon showing their indifference to what had befallen, and every one had his joke to pass upon the damage he had sustained.

"I'll mak' an errand to the maist feck o' the towns i' the parochen the morn," said Tam o' the Binns,

"and tak care to let them ken where I was the night. I'll hirple like a born lamiter, and if the billy be i' the bounds, he'll be hard to pit aff wi' a wrang story about my limp."

"Ay, ay," said the goodwife, "there's Rob o' the Shaws; he bude to be rinnin' too, the young henny that he is! and whae wad hae thought it o' him? he's as modest afore folk as gin he durstna look to the side o' the gate a woman body was passing on; but I warrant he could tell a bonny story ower, an he had a young thing by hersel'!"

Rob's glance wandered to the opposite side of the house, and encountered by the way one from the bright black eyes of the goodwife's own daughter Bell. Both instantly looked upon the ground, and it was not easy to tell which of them seemed most shamefaced. Here was an unexpected disclosure unwittingly made on the part of the two inexperienced lovers; but it was complete, and the ordeal of railery to which it subjected them was unrelenting. The young men passed across the floor to "rub shouters" with Bell, under pretence of wishing to catch the infection of falling in love from her, while the poor young creature was ready to sink down with confusion.

"Haud up your head, deem, and dinna be blate," said her mother, who, Rob being a creditable lover, was much rejoiced "to see her bairn respekt like the lave," and was, moreover, a counthie dame, and loved a joke dearly. "Bonny doings!" said her father, expressing his pride of heart in such a way that his words might also be understood as conveying reproof. "Rare doings, truly. Ye haena seen seventeen simmers yet, lassie!" "Dinna tak it sae sair to heart, my woman," said Katie Dodds; "or ye come to my time o' life (the confident little gipsy was not half a year older than the companion to whom, with a mock-matronly air, she thus addressed herself) or ye come to my time o' life, ye'll hae learned better."

This was meant as a sort of diversion in favour of her friend; for women, that is, beautiful young women, have a greater sympathy for each other in such cases than is generally allowed, and it had the effect of turning part of their railery upon herself.

"Weel, just that ye mayna die of auld age, Katie," said one of the gallants "there needs nane o' us look after Bell, I see), I wad wae ye say to a paction atween us twa?" "On, I'm thinking I wad just hae to tak ye," said she; "but there's Tam o' the Binns has been speaking to me already, and I hae as gude as promised to young Lowrie Loup-the-dike, the fox-hunter, forbye some words of a bargain wi' Sandy Blinders, and —" "Routh o' canny keeks frae somebody else, ye unconscionable limmer," said he, interrupting her, "that gar ye step as lightly as gin ye war stepping to a fiddle—tak care ye dinna dance yourself aff your feet a'thegither some day."

While the conversation was taking this lively turn among the one party, matters were not standing still with the other. A veteran maiden, whose charms might be said to have ungratefully absconded, while she thought of nothing else but repelling the assaults that were made against them—as the commander of a garrison is sometimes abandoned by the townspeople whom he endeavours to defend—this experienced damsel took a seat beside Rob o' the Shaws, and urged him to recount to her every word of his courtship.

"Let us hear what ye said, Rob? How did ye begin? It wad be—How ir ye the night, Bell, and how have ye been sin' I saw you last?" She wad answer, "On, brawly, Rob; ir ye weel?" Syne there wad be some cracks about what for the t'ane or the t'other wasna at the last week's preaching, maybe; at length she wad say it was 'a cauld night,' and ye couldna but gie her a share o' your plaid then, and lead her away to some bield! Was that the gate o't?" And thus she ran on teasing him, with abundance of delight to herself, and vexation to him. Just when his tormentor had got the length of proposing, since he was so brisk a lad, to afford him an opportunity of saying some of his fine things to herself, Babie took pity upon his plight, as Katie Dodds had before upon that of his sweetheart. "Na, na, Mysie," said she, "it's a' ower wi' the young fallows when ye begin to set your cap at them. Mony a ane hae ye garred break his heart in your time."

"In my time!—I assure ye!" said Mysie, tossing her head with as much offended dignity as if she had been a duchess; and she remained silent for the rest of the night.

After these matters of general moment had been pretty fully discussed, the company fell into separate parties, and, by some means or other, Tam o' the Binns found himself left to the mercy of the damsels, who showed some inclination to have a bout at badinage with him.

"Weel, Tam?" said Babie. "Aweel?" rejoined he. "Ye're a braw chield!" said Peggie. "And ye're a bonny lass! Sall we mak a bridal o't?"

Here they were worked in one issue. Peggie was silent, unwilling that he should have the last word, but at a loss to know what it was best to say to prevent it. The goodwife advised her to "say No, and tak him." It was but fitting courtesy that Tam should quit the vantage ground he had possessed, by standing upon the defensive in the first attack, and become the assailant in this tilt of wit.

"If ye'll do as the gudewife bids ye, ye sall hae walth o' your ain will," continued he. "That means—leave to greet my fill when ye cross me," retorted she. "I'll let you keep the purse." "And ye'll

spend the siller." "When I dinna do as you bid me, ye've hae liberty to cut the lugs out o' my head." "And whaten a bonny gudeman wad I-hae o' ye then?" "Now ye hae gien me up my fit," quoth Tam, "ane canna think what to say for looking at your bonny face;" and so saying, he bestowed a kiss upon the healthsome cheek of his fair adversary. "Now, Tam!—weel!" said she, and never got farther.

Tam, heedless of her expostulation, which indeed was not over-earnest, was about to pay the same compliment, as in courtesy bound, to the rest of the damsels, when she for whom he designed it next started up, and made her escape.

"A flie'er wad aye hae a follower," said Tam, as he departed in pursuit. "Tak care o' your fit and the bear trough," cried one; "it's just a man's length frae the jawhole." "But the jawhole's no ower half that to the bottom," added another, "sae there is the less danger."

Tam was out of danger and out of hearing both, ere these warnings were uttered; and those of the party who remained rose and took their leave somewhat more formally.

Such is a specimen of the incidents and conversation by which the firesides of our peasantry were enlivened in the olden times. We could easily have gone on to give a veritable chronicle of the "hearty yoking at sang about," which was also resorted to to help the mirth of these meetings; but it is not required at our hands. The lays they sung are not so perishable as the desultory sallies of "fun and joking" which were first to be exhausted, before the wit of the bard was called for, to eke out the enjoyment of the evening.

POPULAR INFORMATION ON LITERATURE. PERIODICAL WORKS.

ONE of the most remarkable features of the literature of the age in which we live, is the concentration of the talents of many persons, eminent and otherwise, in the composition of individual works, appearing at stated intervals; in other words, our Periodical Literature. During the last century, many of the most distinguished names in the republic of letters employed themselves in sending forth to the world solitary essays at brief intervals; not only, however, did these rarely touch on topics of living interest, but, proceeding in most instances from a very limited number of hands, wanted that variety which alone can secure a sufficiently extensive present circulation to offer any very lucrative return to the author. The system of solitary and acknowledged publications, while it limited, from causes already referred to, the emolument of the writer, and did not encourage so far a circulation of his information or opinions among society, yet exacted a more critical attention in most cases to the matter, and almost always to the form and execution of his work. We may therefore find scattered among the British Essayists, papers which rank among the most profound, most brilliant, and most humorous writings in our language, but we uniformly trace a more methodical arrangement and more tempered digestion than our more hasty, though perhaps not less able, literature can boast. Labour is the point in which the average character—of which alone I can be understood to speak—of the Essayists stands conspicuously higher than that of our periodicals. Hence the more eminent of them have ensured a degree of permanent fame to which, I fear, few, if any, of their successors can aspire; for my young readers may be assured that no reputation can be lasting which has not been reared by patient and persevering application. To society, then, the system of solitary authorship afforded the advantage of a more matured and polished literature; to the authors, that of a more durable and solid reputation.

The periodical literature of the present day is carried on almost entirely by anonymous writing, and it is only in a few cases that the names of the authors are known. The effect produced by this mode of publication is exactly what might have been expected. No writer feels bound to record his conscientious sentiments in his productions. Provided there be an understanding betwixt the writer and publisher, it is considered sufficient; and the readers have no other guarantee for the accuracy of the statements than the character of the publisher. Such a process of issuing opinions certainly induces what may be styled literary hypocrisy, but this is hardly injurious in the end; for such opinions are met by counter-opinions similarly expressed, and so out of the conflict of discussion the truth is elicited. The practice of anonymous writing in our modern periodicals has the beneficial effect of bringing forward humble and retiring genius. The individual who writes an article in a magazine has not the satisfaction of having his name made widely known, but his vanity—one of the most powerful and useful of the passions—is flattered by the immediate and extensive celebrity given to the publication of his sentiments. The various but unalterable modifications of human temperament render it inevitable that when men associate for literary objects, they should arrange themselves in groups, each characterised by some predominant cast of thought. When, therefore, any individual is permitted to employ the organ of one of these parties for the publication of his sentiments, he is certain at least of the approbation of his brotherhood, while the unascor-

tained character of his pretensions ensures him a far less partial judgment from all than he could otherwise have attained. Thus the modest assume confidence, and the vain eagerly seize the present meed of popular applause, without very accurately calculating the chances of their posthumous honours. Whether indeed the new system offers preponderating advantages to the public, may be doubted. Setting aside the consideration of political questions, and viewing our periodical literature as entertaining moral, literary, and scientific subjects alone, I am disposed to answer the question in the affirmative. The quality of the food supplied to society may be in some respects deteriorated, but the supply is more ample, the table infinitely more extended, and greater variety introduced among the viands.

Having premised this much on the general subject of our periodical literature, I will now offer a few remarks on the more important of the works of which it consists. In doing this, I shall endeavour to keep as much as possible out of sight the politics of the respective journals, and confine my observations to their literary pretensions and character. Viewed in this light, I apprehend all persons of all parties will concur in placing the *QUARTERLY REVIEW* at the head of the list. Indeed there is not only no other journal which rivals, but none which approaches it in the ability of its criticisms and discussions in almost every department of literature. In politics it has been the unvarying advocate of the Tory party, and has of course commanded the services of the most able writers among that class of politicians. The political views of the other parties who divide the country may have been advocated with equal ability in their respective organs, but in the departments of classical literature, history, geography, and belles lettres, the *Quarterly* has had no rival, while the extent of its circulation has frequently led the most eminent writers on professional topics to prefer its pages to those of the journals appropriated to such matters.

The *Quarterly Review* attained its present celebrity under the management of WILLIAM GIFFORD, whose life has already been detailed in the pages of the *Journal*. The patient perseverance by which this man won his way into notice from the lowest origin, and in spite of every conceivable disadvantage, is enough of itself to show that Gifford was not a man to be disheartened by difficulties, or exhausted by labour. His prominent literary qualifications were strong common sense, with its "shade inseparable," a keen sense of the ridiculous; ready command of language, and irresistible power of sarcasm. Late as his education commenced, his continued application had stored his mind with varied learning, while the precision of his memory enabled him on all occasions to recall at a moment the particular information required. His moral qualifications for directing the public mind were not less valuable than his intellectual. Towards vice, meanness, hypocrisy, cant, and servility, he felt that genuine indignation which makes the cheek reddened and the tongue eloquent. He published a translation of the *Satires of Juvenal*, which has been reckoned meritorious in its way. In the *Baviad* and *Mæviad*, an original satire, he showed that degree of talent which has induced his admirers to regret that he wasted his strength on insects, which, though annoying, were but ephemeral, and against which a lady's fan would have been a more suitable weapon than the club of Hercules. No circumstance can give a higher idea of the sterling value and independence of his character, than that he was originally brought forward into public life by a Whig nobleman, Lord Grosvenor, who continued his zealous patron while patronage was necessary, and whose friendship suffered neither intermission nor abatement from the energy with which Gifford advocated principles opposite to his own. A circumstance like this impresses us with an exalted idea of both the parties.

Such was the man under whom the *Quarterly Review* attained pre-eminence. His talents and his principles gave a respectability and weight to the work, which brought men of the highest eminence to its support, and among Gifford's body of contributors were soon enrolled the most distinguished names not only of the secluded scholars of the universities and the church, but of men engaged in the most active scenes of public life. Heber, Milman, Southey, Canning, Croker, Barrow, and several of the most conspicuous ornaments of the present Episcopal bench, were among the staff who surrounded Gifford on many a field of victory. Under this management, however, the *Quarterly*, though always able, and generally brilliant, became at length somewhat too uniform in its character. Severity in the exposure of veiled wickedness or empty pretension was the giant strength of the editor, and he certainly did sometimes use it as a giant. What he (doubtless conscientiously) believed to be mean or vicious, he scrupled not to expose in a style of abuse only equalled by one other periodical, and for this he has been condemned (doubtless as conscientiously) as acting the character of a base and servile tool of the party to which he happened to belong. The life of Gifford affords an illustration of the contrast drawn between the authors of the present century and those of the last. Had Gifford flourished sixty years earlier, his influence and reputation while alive could scarcely have been half as extensive as they actually were; nor is it at all probable that he would have been able to spend his latter years in the comparative luxury which he enjoyed, while, on the

other hand, his name might have descended to posterity coupled with some monument not less splendid than the *Rambler*. As it is, the Great Editor—the man who long stood at the head of a great branch of English literature—is little more than the shadow of a great name. The *Mæviad* and *Baviad* have perished from the insignificance of their objects of attack; the fame of a translator had but a reflected lustre, and over his contributions in the *Quarterly* there hangs a cloud of uncertainty, which jealousy may thicken at present, as time will rapidly condense it into impenetrable darkness.

After a short interregnum, the management of the *Quarterly* was devolved upon the present editor, J. G. LOCKHART. This gentleman is a Scotchman by birth. He was educated at one of the English universities, and, in after life, was married to a daughter of Sir Walter Scott. While resident in Edinburgh, he contributed largely to Blackwood's Magazine, and produced a volume of translations of Spanish ballads, besides, it is believed, some prose works of fiction. To fill the chair of the Great Editor, without any diminution of its authority, required a combination of qualities not easily to be found. Lockhart, however, has not only fulfilled this condition, but has supplied deficiencies which, though counterbalanced by illustrious qualities, were still experienced under his predecessor. Cradled in literature, the companion of wits from his youth, combining every advantage which domestic cultivation and foreign travel could bestow on a mind naturally acute, lively, and profound, he imparted a degree of grace, polish, and variety to the *Quarterly*, which early disadvantages never permitted Gifford to acquire. Severity was the original character of the *Quarterly*, and assuredly it has not been forfeited under Lockhart's management. It would be difficult to imagine a man better qualified for the situation he occupies. As a classical scholar, he stood in the first class at Oxford; in acquaintance with German, Spanish, French, and Italian literature, he is second to no one of his countrymen; while his juvenile efforts proved him capable of taking the highest rank among our poets and novelists, had he not turned his attention to graver subjects. These solid acquirements and talents would of themselves have ensured him the co-operation of the ablest men of his day; but companionship in education, and his alliance with Sir Walter Scott, have given him a personal influence over large sections of the literary world, independent of his actual attainments. The most frequent contributor to the *Quarterly*, after its successive editors, is understood to have been Southey. His articles embrace a wide range of topics connected with general literature, and particularly in relation to the progress and prospects of society. His writings are distinguished for historical accuracy, purity of idiom, and a felicitous arrangement, the simple perspicuity of which is owing to complete mastery of his subject, and long-continued labour in the art of composition. As I mentioned in my first article on this subject, he is probably the greatest living master of English prose, and may justly challenge that highest praise of art—that the inexperienced reader is left wholly incautious of its exertion. Since the accession of Lockhart as editor, it is believed that Sir Walter Scott has furnished a few articles, also of surpassing merit of their kind, and equally distinguishable for the soft placidity of the diction. The *Quarterly* continues to adhere most resolutely to its original political bias, and it will be freely allowed by persons of the most opposite opinion, that in no publication in the present day has such strength of argument been used in the defence of what are entitled "conservative principles." The work is thus the great bulwark of its party, and were it abandoned in the mêlée of contest, sore, sore, I doubt not, would be the lamentation over its fall.

BABBAGE ON MACHINERY.

CHARLES BABBAGE is one of the few original bold-thinking minds of the present age, in which genius seems to be granulated into a common level, and few take the liberty of thinking for themselves. This ingenious author, who happens to be Lucasian Professor of Mathematics in the University of Cambridge, some years ago had the temerity to write a work on the *Decline of Science in England*, which created no small degree of consternation among various metropolitan societies deeming themselves the sole repositories of modern science and philosophy; and now he has brought forward an instructive volume on the *Economy of Machinery and Manufactures*, the materials of which can only have been collected by extraordinary industry. The work is superficial in its details, but contains much that is novel and useful to most readers on almost every branch of mechanics and manufactures. Mr Babbage is an enthusiast in matters connected with these very important essentials in the greatness of our empire. For a considerable period he has been labouring to produce a machine capable of working certain questions in arithmetic and logarithms, and has thus contrived, and nearly brought to perfection, one of the most wonderful combinations of mechanism ever invented by man. The book which he has now published contains a brief account of the mode of manufacturing a vast quantity of articles in daily use, particularly exemplifying the value of mechanical and scientific power in simplifying human labour, and saving outlay of capital. To give my readers an idea of the tone in which the work is writ-

ten, I shall present a few passages relative to the economy of human time—the employment of materials of little value—and the use of tools.

“The skins used by the goldbeater are produced from the offal of animals. The hoofs of horses and cattle, and other horny refuse, are employed in the production of the prussiate of potash, that beautiful, yellow, crystallised salt which is exhibited in the shops of some of our chemists. The worn-out saucepans and tin ware of our kitchens, when beyond the reach of the tinker's art, are not utterly worthless. We sometimes meet carts loaded with old tin kettles and worn-out iron coal-scuttles traversing our streets. These have not yet completed their useful course; the less corroded parts are cut into strips, punched with small holes, and varnished with a coarse black varnish for the use of the trunkmaker, who protects the edges and angles of his boxes with them; the remainder are conveyed to the manufacturing chemists in the outskirts of the town, who employ them, in conjunction with pyroligneous acid, in making a black die for the use of calico printers.

The difference between a *tool* and a *machine* is not capable of very precise distinction; nor is it necessary, in a popular explanation of those terms, to limit very strictly their acceptation. A *tool* is usually more simple than a machine; it is generally used with the hand, whilst a machine is frequently moved by animal or steam power. The simpler *machines* are often merely one or more *tools* placed in a frame, and acted on by any moving power. In pointing out the advantages of *tools*, we shall commence with some of the simplest.

To arrange twenty thousand needles thrown promiscuously into a box, mixed and entangled with each other in every possible direction, in such a form that they shall be all parallel to each other, would at first sight appear a most tedious occupation; in fact, if each needle were to be separated individually, many hours must be consumed in the process. Yet this is an operation which must be performed many times in the manufacture of needles; and it is accomplished in a few minutes by a very simple *tool*; nothing more being requisite than a small flat tray of sheet iron, slightly concave at the bottom. The needles are placed in it and shaken in a peculiar manner, by throwing them up a very little, and giving at the same time a slight longitudinal motion to the tray. The shape of the needles assists their arrangement; for if two needles cross each other, unless, which is exceedingly improbable, they happen to be precisely balanced, they will, when they fall on the bottom of the tray, tend to place themselves side by side, and the hollow form of the tray assists this disposition. As they have no projection in any part to impede this tendency, or to entangle each other, they are, by continually shaking, arranged lengthwise in three or four minutes. The direction of the shake is now changed, the needles are but little thrown up, but the tray is shaken endways; the result of which is, that in a minute or two the needles which were previously arranged endways become heaped up in a wall, with their ends against the extremity of the tray. They are now removed by hundreds at a time, by raising them with a broad iron spatula, on which they are retained by the fore-finger of the left hand. During the progress of the needles towards their finished state, this parallel arrangement must be repeated many times; and unless a cheap and expeditious method had been devised, the expense of manufacturing needles would have been considerably enhanced.

Another process in the art of making needles furnishes an example of one of the simplest contrivances which can come under the denomination of a *tool*. After the needles have been arranged in the manner just described, it is necessary to separate them into two parcels, in order that their points may be all in one direction. This is usually done by women and children. The needles are placed sideways in a heap, on a table, in front of each operator, just as they are arranged by the process above described. From five to ten are rolled towards this person by the fore-finger of the left hand; this separates them a very small space from each other, and each in its turn is pushed lengthways to the right or to the left, according as its eye is on the right or the left hand. This is the usual process, and in it every needle passes individually under the finger of the operator. A small alteration expedites the process considerably; the child puts on the fore-finger of its right hand a small cloth cap or finger-stall, and rolling out of the heap from six to twelve needles, he keeps them down by the fore-finger of the left hand, whilst he presses the fore-finger of the right hand gently against their ends: those which have the points towards the right hand stick into the finger-stall; and the child, removing the finger of the left hand, slightly raises the needles sticking into the cloth, and then pushes them towards the left side. Those needles which had their eyes on the right hand do not stick into the finger-cover, and are pushed to the heap on the right side previously to the repetition of this process. By means of this simple contrivance, each movement of the finger, from one side to the other, carries five or six needles to their proper heap; whereas, in the former method, frequently only one was moved, and rarely more than two or three were transported at one movement to their place.

Various operations occur in the arts in which the assistance of an additional hand would be a great convenience to the workman, and in these cases tools or

machines of the simplest structure come to our aid: vices of different forms, in which the material to be wrought is firmly grasped by screws, are of this kind, and are used in almost every workshop; but a more striking example may be found in the trade of the nail-maker.

Some kinds of nails, such as those used for defending the soles of coarse shoes, called hobnails, require a particular form of the head, which is made by the stroke of a die. The workman holds the red-hot rod of iron out of which he forms them in his left hand; with his right hand he hammers the end of it into a point, and cutting the proper length almost off, bends it nearly at right angles. He puts this into a hole in a small stake-iron immediately under a hammer connected with a treadle, which has a die sunk in its surface corresponding to the intended form of the head; and having given one part of the form to the head by the small hammer in his hand, he moves the treadle with his foot, which disengages the other hammer, and completes the figure of the head; the returning stroke produced by the movement of the treadle striking the finished nail out of the hole in which it was retained. Without this substitution of his foot for another hand, the workman would probably be obliged to heat the nail twice over.

Another, although fortunately a less general substitution of tools for human hands, is used to assist the labour of those who are deprived by nature or by accident of some of their limbs. Those who have had an opportunity of examining the beautiful contrivances for the manufacture of shoes by machinery, which we owe to the fertile invention of Mr Brunel, must have noticed many instances in which the workmen were enabled to execute their task with precision, although labouring under the disadvantages of the loss of an arm or a leg. A similar instance occurs at Liverpool, in the Institution for the Blind, where a machine is used by those afflicted with blindness, for weaving sash-lines; it is said to have been the invention of a person suffering under that calamity.”

THE TWELFTH OF AUGUST.

THE Twelfth of August!—Are there four words in the English language that call up such a host of agreeable associations? The fair one's whisper must be prodigiously sweet when she articulates the consenting Yes; yet I have known youths, and men of mature years too, who appeared to be in much higher spirits while putting every thing in order for the moors, than when about to depart on their marriage jaunts. And I do not wonder at all at the circumstance. To see the sun rising from the ocean, at half-past four in the morning—ourselves stationed on a high hill-top—the congregated vapours curling and dispersing far below—measureless tracks of heather around, glistening with dew, and tipped with pencils of new-born light, more radiant than its own purple bells—to surprise the shrill skylark at his matins, and the hare as she steals upon her early fare; why, these are enjoyments that would be poorly exchanged for slothful slumbers on the softest couch that ever derived its elasticity from down filched from the eider-duck's breast. Add to this the high gratification of having your cheek fanned by the first breeze that is chased into action by the morning's breath; the independence implied by the possession of manly and vigorous powers; the admirable docility and tactics of animals which bring their instincts to bear upon their masters' pleasures, and then, in place of inquiring *who would*, rather say *who would not be a sportsman?* Toppers, we are told, drive at every fresh debauch an additional nail into their coffins; but as every proposition has its converse, he who repairs annually to the moors must draw at least one nail out; and there is, moreover, some reason for believing that there are many who would sink under the winter's toils, but for the seasonable and needful repair which their constitutions undergo during the autumn. As the viol-strings are slackened by the friction of the bow, so a strictly sedentary life impairs and unhinges the most elastic frame; but air and exercise are the pegs or knobs that screw us into *tune*—that restore the wonted harmony of the system, and give to all the springs that minister to health, a higher tone and a freer play. And if these reasons fail to satisfy you, only think of the sportsman's evening comforts, for then you see him all in his glory. He who never trode the moors knows nothing comparatively of the luxury of dining—not of picking like a bilious citizen, but of eating like a hale and healthy man. An individual, we shall say, who but a week before hung languidly over the breast of a chicken, now acquits himself so super-excellently as a trencherman, that you would not give a pin's fee for the reversion of his interest in a heaped platter of beef-steak. While recounting with a friend the events of the day, he may perhaps take a cup extra, but his slumbers are refreshing notwithstanding. The very depth and breadth of his inspiration may convince you that he has acquired an accession of strength, and that you would find it rather difficult to awaken him, even if you were to employ the town drummer to strike up a march under his ear.

Most sportsmen agree in thinking that grouse are declining, while blackcocks are increasing fast in numbers. Some, in fact, maintain that blackcocks attack and kill the grouse, or extirpate them by some other means, while those who denizen almost constantly on the hills, aver that they never witnessed any thing of

the kind. Formerly live blackcocks were exported to Yorkshire for the purpose of introducing and extending the breed; but, touching this point, many Englishmen have received of late a new light, and have taken such a dislike to the truly *Scottish* qualities of the biped in question, that they now insist stoutly on the necessity of keeping the blackcocks *out*, as the only means of keeping the grouse *in*. As these birds breed on marshy grounds, the moor-burn rarely reaches their dwellings; and hence it has been rather rashly inferred that an immense destruction of grouse is occasioned by the fires that are annually lighted on our moors. But it should be kept in mind, that blackcocks flock to the arable plains in summer, as many a farmer knows to his cost; that their camp is not always a heather bush, but that they often roost on trees at such a height as enables them to escape the ravages of vermin. But grouse and moor-partridges are differently situated; and all the shepherds I have conversed with believe that the principal cause of their depopulation arises from the prejudice that exists as to burning heath. Corn is the staff of human life—green or blooming heather the food of the heathcock, and his numbers, like our own, may be augmented or thinned by the comparative plentifulness or scarcity of food. It may be impracticable to plough a barren hill, but if you burn it occasionally, the crop it bears will be improved both as to quantity and quality. Old heather runs to wood, and only bears a scanty herbage at top; and independently of this, its foliage becomes so tough that neither sheep nor birds will eat it, if there be any thing better within their reach.

I have thus got quit of one objection, and the remaining one is—Does not moor-burn destroy a great many eggs? I believe not, and have evidence before me which seems pretty conclusive. One experienced sheep farmer, and land proprietor, says, “I have burnt heather all my life, and never was placed under any restrictions. I never knew a grouse hatch in a plantation or plot of old heather, but always in young heath, or single bushes too far apart to be touched by the flames. I will give the observations I made last year as a specimen. One nest was in a bush about a foot high, and measuring seventeen inches by thirty-five; the heather was burnt two years before, all round. Other three nests were in young heather, six or eight inches high, and on the sides of brown or broken land; several were at the back of drains and rivulets, as I suppose. But burning of heath ought to be done in rotation; perhaps a *third* or *fifth* rotation, according to the dryness or wetness of the soil, or the stock that feed on it. Old sheep eat heath more than young ones, and it springs sooner on moist soils than dry. By following this plan, the grouse will rapidly increase in numbers. It is evident that sheep, cattle, and hares, always prefer young heath when it can be had; any person who observes where hares feed in winter, when there is a little snow on the ground, may know whether this is true. It is a fact that those farms which are most regularly burnt abound most with game.”

From what has been said, I feel inclined to draw the following inferences:—

First, that part of the heather on every sheep farm which may cover on an average half the surface, should be burnt every year; the nature of the ground regulating the rotation. The stalks, when reduced to ashes, promote vegetation; sweet heather and sweet grass spring up simultaneously; so that umbrageous spots which were formerly avoided, and covered with herbage which no animal would eat, are restored to a profitable state of cultivation.

Second, that as regards mountain-heath, the best thing you can do to promote the growth of game is to follow the best mode of sheep husbandry. A farmer who is unrestricted, as compared with one fettered by conditions, will give L.50 per annum more for a sheep-gang—say of 1500 acres; and if this and the preceding facts be admitted, it would certainly be prudent to abandon a system which is alike prejudicial to the landlord's profits and the sportsman's pleasures.

Third, if heath be burnt on one farm and not on another, the grouse will form themselves into emigration societies, and occupy locations without asking any body's leave, or submitting to the forms imposed on every class of rational settlers; their wings obviating the necessity of tonnage, expense of outfit, and every other charge. Those, therefore, who think the old system the best, would do well to adopt the new in self-defence.—*M'Diarmid's Sketches of Nature.*

THE “PEST” OF ANCIENT TIMES.

FROM “*Anne Breve Description of the Pest. Set forth by Maister Gilbert Skene, Doctoure in Medicine. Imprinted at Edinburgh by Robert Leppreik. Anno Do. 1568.*” Published for the ostensible purpose of informing the people how to avoid or cure the plague then recently introduced into the realm.

“The pest is the corruption or infection of the air, or aie venomous qualitie and maist hurtful vapour thairof, quihik hes strenthe and wicketnes above all natural putrefaction, beand contractit, first maist quietlie infectis the spirital partis of manne's bodie, thairefter the humoris, puttand sairest at the natural humiditie of the hart, quihik is tholand corruption and fevir maist wicketlie quietlie and thiefie strikis the patient.”

After describing the plague as being generally the result of God's indignation at the sins of men, he proceeds to state as “inferiour causis”—“Standand wat-

ter, sic as stank, pule, or loche, most corrupte and filthe: Erd, dung, stinkand closetis, deid carriounis unburiert, in speciale of man kynd, quihilkis, be similitude of nature, is maist nocent to man, as everie brutal is maist infectand to thair awin kynd. Farther," he continues, "continual schouris of weit with grete southin wynde, or the samyn blawand from pestiferous places. The cause of pest in aue privet citie is stikand corruptionand filths, quihilkis occupes the comune streetis and gaittis, gret reik of colis without winde to dispatche the sam, corruption of herbis, sic as cail and growand treis," &c. &c.

THE JILTED BAGMAN, A TALE OF THE AFFECTIONS.

MARK ANTHONY SNUBBS was the youngest son of a respectable butcher in Leeds. Even in childhood, young Snubbs was remarkable for an ambition which soared beyond the narrow sphere to which his birth threatened to confine him. He disdained to associate with the young butchers of the neighbourhood, and attached himself to the genteeler society of attorneys' clerks and mercers' apprentices, a circumstance which excited the indignation of his father, who threatened to disinherite him, on pretence of his being too fine a gentleman to do credit to an honourable calling. But, fortunately, the young man's maternal uncle, a silk weaver in the place, viewed his character in a more favourable light; he admired his nephew's spirit, and, resolving to encourage it, obtained for him the place of shopboy with an eminent haberdasher in London. In this situation young Snubbs neglected no opportunity of cultivating the graces; and as he at the same time had tolerable parts, a modest assurance, and a ready tongue, he rose so rapidly in his master's favour, that he was appointed to travel for the house to the north of England, and to Scotland. This appointment had long been the aim of our hero's exertions, and the object of his ambitious wishes; and Alexander of Macedon felt not greater pride when he had first tamed the fierceness of Bucephalus, than did Snubbs when he found himself master of a stout hackney, trotting on the highway to happiness and Carlisle. It was here that he met, for the first time, the accomplished Miss Geraldine Snooks, the daughter and heiress of a rich attorney. He had the honour of dancing with her at a charity ball; he afterwards met her at a tea party, and took the liberty of offering to accompany her next morning to a concert. His attentions now became more particular; he visited her at her father's house—stole her fan—wrote verses upon her French poodle—and, in short, had made a strong impression upon her affections, when he was discovered, one morning, kissing his mistress's hand, and trying to prevail with her to accompany him upon his northern excursion, as far as Gretna Green, by old Snooks, who kicked him down stairs, and forbade him his house for ever. This was a severe blow to his hopes; and Snubbs, in the height of his indignation, meditated claiming satisfaction from the attorney, either by the duello or an action for assault. Upon farther reflection, however, he adopted the more prudent and Christian resolution of overlooking the affront, in consideration of his love for the fair Geraldine. He immediately quitted Carlisle, where he had lost his heart, and, we are sorry to add, his book of patterns; the latter loss, however, was scarcely felt before it was relieved, by the restoration of the article, with a hastily written and indifferently spelt note from Miss Snooks, expressing sympathy for his sufferings, and swearing unalterable attachment to his person and fortunes. The truth is, the patterns had slipped from the pocket of Mark Anthony's inexpressibles, during his somewhat precipitous retreat, before the enraged Octavius Snooks. The constancy of his mistress greatly consoled our hero under the indignity he had just experienced, and he comforted himself with the thought that "the course of true love never did run smooth"—a truth which was farther confirmed in his own experience, by his horse stumbling on a piece of new laid road, and depositing the unhappy lover in a dry ditch. Snubbs did not allow this accident to ruffle his lately recovered equanimity; on the contrary, as he discovered that his nag had lost a shoe, he led him, with much tenderness, to a neighbouring smithy; and while the grim master of the forge was performing his office, our lover availed himself of the unavoidable delay, to pen a few stanzas to his mistress, in imitation of Shenstone's "Pastoral Ballad." In this piece he paints the pangs of absence, threatens to break his pipe and crook, and pathetically recommends his sheep and his goats to the care of his brother swains, as he is entirely occupied with his passion for the divine Snooks. After dispatching this effusion by a ragged little Cyclops, whom he bribed with a sixpence and a glass of purl, he resumed his journey, and arrived safe in Glasgow, where he for a time forgot his love, in transacting the business of his employers. But a short excursion which he had occasion to take into the Highlands effectually recalled his attention to love and the muses. During his passage by steam, from Balloch to the head of Loch Lomond, he composed a long elegy, of which the following stanzas are a fragment:—

While hapless exile, on a distant shore,
I wander far from joy and Geraldine;
Still 'mid the torrent's rush, the tempest's roar,
Angelic Snooks! my heart is ever thine.

Condemn'd amid these 'orrid scenes to stray,
What dangers has thy Snubbs already pass'd—
Where savage Celts their brawny legs display,
In naked freedom, to the northern blast.

Ah! should my bark, when winds too rudely blow,
Be doom'd to perish in this boundless sea,
Wilt thou, my Snooks—I know thou wilt—bestow
A tear for him who died for love of thee?

It does not clearly appear that Mr Snubbs was entitled to consider himself as dying for love of Miss Snooks, even in the event of the catastrophe which he, here contemplates, seeing that the exclusive object of his excursion on Loch Lomond—which, by the way, he somewhat absurdly mistakes for a boundless sea—was to make a descent on Glenfalloch, and thence pass to Inverary, for the purpose of collecting certain sets of tartan. But poetical licence must be allowed to a bagman and a lover.

On his return from this Highland excursion, Mark Anthony had a short but satisfactory interview with his mistress, who gave him a lock of her hair, which we may here mention was of that shade of red which is commonly called *sandy-colour*. In return, Mr Snubbs presented her with an elegant tweezer-case; vows of the most lasting attachment were mutually pledged between the lovers, and a day fixed for their elopement. In the meanwhile, Mr Snubbs considered himself bound in honour to return without delay to London, and give his employers an account of his northern journey. This account was found to be highly satisfactory; and the manager of the commercial house to which he was attached was so pleased with his diligence and success, that he promoted him, from a trotting galloway, and ninety pounds per annum, to a higher salary, and the luxury of a gig. Greatly elated with his promotion, our traveller lost no time in writing to his innamorato an account of his brightened prospects; nor was he long in receiving an answer, as warm as he could have wished, and earnestly pressing him to return immediately to Carlisle, where his anxious Geraldine was expecting him with open arms. But the gifts of fortune are not only fallacious in their their own nature—they are also very apt to exert a mischievous influence on the character and feelings of individuals. We cannot say that Mr Snubbs's love was now less warm than when he was less favoured by the capricious goddess; but finding himself more flush of ready money than usual, he resolved to make the most of his bachelor liberty, by mixing freely in the gaieties of the metropolis. He spent much of his time at Astley's, the Haymarket, the Cockpit, and even ventured once or twice to the Opera. Such a life of pleasure could not be expected to last; and Mark Anthony's superfluous funds were soon exhausted. But in proportion as his finances began to be impaired, his love revived; and he was seriously meditating a northern excursion, with the intention of acquiring a husband's claim over the person and fortune of his love-sick Geraldine, when, fortunately, his employers resolved to send him thither on commercial business. Hitherto we have contemplated Snubbs as the *enfant gâté* of fortune; but the mutability of human affairs extends to bagmen as well as to kings and heroes; and Mark Anthony Snubbs, like his great namesake the triumvir, was destined to be made the sport of a woman. Though naturally sanguine, and free from superstition, he felt oppressed with a presentiment of evil as he approached the ancient city of Carlisle. It was night before he arrived at his inn; yet the anxiety which he felt would not permit him to call, as usual, for his slippers and nightcap; he therefore hurriedly discussed a pound and a half of minced collops, with a cut of salmon, for his supper, and having swallowed half a quart of distilled waters, by way of security against the night air, he sallied forth to reconnoitre Mr Snooks's premises, and obtain, if possible, an interview with his mistress. The wealthy attorney's house, with the retiring modesty which is supposed to characterise its owner's profession, stood a little back from the line of the street, and was surrounded with a small but neat orchard. An iron gate, which was secured only by a latch, afforded ready access to this second paradise, and Mr Snubbs succeeded in stealing round to his mistress's window unobserved. Here, however, he tapped and whispered in vain; he even ventured to hum, in a disconsolate tone, the words of a Scotch song—

This ae night, this ae night,
O rise and let me in.

Still no Miss Snooks echoed back the cadence of his song. In a fit of desperation, the love-sick bagman now approached a window through which streamed a flood of light. The shutter was only half closed, so that our traveller could easily perceive what was doing within; but what pen can describe the horror of the unfortunate bagman, when he saw, in Mr Snooks's best parlour, which was splendidly lighted up for the occasion, with wax tapers and argand lamp, Miss Geraldine Snooks in her bridal dress, and smiling from ear to ear, leading down a dance with an elderly gentleman in tights, with huge gold buckles and a George the Fourth wig, and whom he readily recognised as old Oronoko, the rich tobaccoist, for whom the fickle Miss Snooks had often expressed a particular aversion. At this unexpected sight, Snubbs could not suppress an audible groan, which instantly interrupted the festivities within. The attorney, snatching a horse-pistol from the mantelpiece, rushed to the door, followed more leisurely by the bridegroom, armed with the fire-shovel. Our hero now endeavoured to effect his retreat, but unsuccessfully, as one leg was caught in a man-trap, which Snooks had placed near a favourite apple tree, and the other was held fast by a large house dog, who had rushed forth upon the first alarm. The bagman's cries guided the company to the scene of action. Lights were procured, and poor Snubbs was at last rescued from his perilous situation. He had fortunately received little bodily harm, but his fright was excessive, and his clothes were torn. He was speedily recognised, and his sufferings excited rather merriment than sympathy; but what affected him most was, that his mistress, instead of showing any signs of remorse or pity, joined very heartily in the mirth which his deplora-

ble plight had provoked. Old Snooks, indeed, threatened a prosecution for trespass; but the good-natured tobaccoist interfered, and even Mrs Oronoko joined in interceding for her unfortunate lover.

The jilted bagman is now a respectable mercer in his native town of Leeds, and, in the arms of an affectionate wife, has forgotten the disdain of Miss Geraldine Snooks. —*Edinburgh Spectator*.

PEOPLE WITH ONE IDEA.

HAVE any of my readers the misfortune to be acquainted with some person who has but one idea, or who speaks for ever upon only one subject, no matter what? There are such persons, and they are serious annoyances in society. I call them *monomaniacs*, or people who have run mad on one subject. On every thing else they will talk rationally, though only for a moment. They feel pained at the introduction into conversation of something apart from their own favourite notion, and hurry to start the idea on which they have talked all their lives, and which they will probably never leave at rest till they themselves are quiescent. Hazlitt, in one of his essays, hits off people with one idea in his happiest and most sarcastic style:—"There is Major C—— (says he); he has but one idea or subject of discourse—parliamentary reform. Now, parliamentary reform is, as far as I know, a very good thing, a very good idea, and a very good subject to talk about; but why should it be the only one? To hear the worthy and gallant major resume his favourite topic, is like law-business, or a person who has a suit in Chancery going on. Nothing can be attended to, nothing can be talked of but that. Now it is getting on, now again it is standing still. Like a piece of pack-thread in the barrister's hands, he turns and twists it all ways, and cannot proceed without it. Some school-boys cannot read but in their own book, and the man of one idea cannot converse out of his own subject. Conversation it is not; but a sort of recital of or preamble to a bill, or a collection of grave arguments, for a man's being of opinion with himself. It would be well if there was any thing of character, of eccentricity, in all this; but that is not the case. It is a political homily personified—a walking commonplace we have to encounter and listen to. It is just as if a man were to insist on your hearing him go through the fifth chapter of the Book of Judges every time you meet, or like the story of the Cosmogony in the Vicar of Wakefield. It is a tune played on a barrel organ. It is a common vehicle of discourse into which they get, and are set down when they please, without any pains or trouble to themselves. The man has no more to do with the question which he saddles on all his hearers than you have, and this is what makes the matter hopeless. He goes out of his way to be absurd. He has got possession of a subject which he conceives to be of universal and paramount interest. His delight is to harangue on what nowise regards himself. But time and tide wait for no man. The business of the state admits of no delay. The question of ——— stands first in the order of the day—takes precedence in its own right of every other question. Any other topic, grave or gay, is looked upon in the light of impertinence, and sent to *Coventry*. Business is an interruption; pleasure is a digression from it. It is the question before every company where the person with his one idea comes, which immediately resolves itself into a committee of the whole world upon it, is carried on by means of a perpetual virtual adjournment—and it is presumed that no other is entertained while this is pending—a determination which gives its persevering advocate a fair prospect of expatiating upon it till his dying day. As Cicero says of study, it follows him into the country; it stays with him at home; it sits with him at breakfast; and goes out with him to dinner. It is like a part of his dress, of the costume of his person, without which he would be at a loss what to do. If he meets you in the street, he accosts you with it as a form of salutation; if you see him at his own house, it is supposed you come upon that. If you happen to remark, 'It is a fine day, or the town is full,' it is considered as a temporary compromise of the question; you are suspected of not going the whole length of the principle. A topic of this sort, of which the person himself may be considered as almost sole proprietor and patentee, is an estate for life; free from all encumbrance of wit, thought, or study, you live upon it as a settled income; and others might as well think to eject you out of a capital freehold house and estate as think to drive you out of it into the wide world of common sense and argument. Every man's house is his castle; and every man's commonplace is his stronghold, from which he looks out and smiles at the dust and heat of controversy. There are some who fancy the corn-bill the root of all evil, and others who trace all the miseries of life to the practice of muffling up children in night clothes. They will disclaim by the hour together on the first, and argue themselves black in the face on the last. It is in vain you give up the point. They persist in the debate, and begin again—"But don't you see, ———?" These sort of partial obliquities, as they are more entertaining and original, are also, by their nature, intermittent. They sometimes hold a man but for a season. He may have one a-year, or every two years; and though, while he is in the heat of any new discovery, he will let you hear of nothing else, he varies from himself, and is amusing undesignedly. People of the character here spoken of—that is, who tease you to death with but one idea—generally differ in their favourite notion from the rest of the world; and, indeed, it is the love of distinction which is mostly at the bottom of this peculiarity."

CHINA.

THE following interesting account of China, and the commerce carried on with it by this country, is drawn up from a Parliamentary paper published two years ago.

China and Europe are the two most opposite communities in the world, not merely in geographical position, but in every thing that constitutes nationality; both highly civilised, far above the average of any of the nations surrounding each, yet of a species of civilisation singularly different; the opposition of habits, customs, manners, descending into the minutiae of every-day particulars in a manner and a direction of divergency almost ludicrous. Our relative ideas of each other's importance are regulated by the same standard of opposition; an ancient Chinese map represents the celestial empire as occupying the whole of the sheet on which it is drawn, with the exception of one corner, which is set apart for all the rest of the world; in an ancient European map of the world; on the other side, we look in vain for China, or find it perhaps a solitary name, as a part of *Terra Incognita*. We live now in better times; our globes or maps are not disgraced with distorted drawings of that great nation; and its neighbouring territories, its geographical positions, are laid down with tolerable precision; but as to the interior, with the exception of the general lines of deviation of some of its larger rivers, and the bearings of some of its more important positions, our knowledge, it must be confessed, is very inadequate, either to the absolute magnitude of that wonderful empire, or to its relative importance as affecting our extended and still extending commercial and political relations.

The information given in the evidence now before us fills up several of these chasms. It comes also in an authenticated form, from individuals well acquainted with the particulars they detail, deeply interested in the inquiry, and placed in a situation in which they know that a searching eye is watching over their relation, active to catch and eager to expose any misstatement or fallacy. The accounts given by them may therefore be safely relied upon as to general fidelity and accuracy.

The real amount of the population of China has been long one of the unsolved problems in geography. Though the commonly received statements were usually considered to be overrated, yet it was deemed an indisputable fact that the total, after every reasonable deduction had been made, was far beyond that of any European country, or, indeed, of any with which we are acquainted. From the statistical table already alluded to, it appears that the whole population of China proper, exclusive of Tartary and the dependent provinces, amounts to 141,470,000 souls, which, when compared with the area or surface of the country, gives an average of 103 souls for every square mile. Let this be compared with the known averages of some other countries. China, per square mile, 103 souls; Hindostan, 104; Austria, 110; France, 164; England, 222.

Thus we see that this so much vaunted population does not amount to one-half of that of England, compared with the relative extent of territory of each country.

The cause of the apparently excessive population of China arises from the provinces being very unequally peopled, and the over-crowded portion of the country being that to which foreigners generally, if not solely, had access. There are in fact but four provinces, out of the fifteen into which the empire is divided, that are densely inhabited; these embrace but little more than one-fourth of the entire area, yet contain above two-thirds of the population.

The circumstances connected with emigration have been also ill understood, and therefore much misrepresented. The following summary of the information given in this curious document will serve to show the real state of the case, and in some measure to develop the grounds of the misconception. The emigrations of the Chinese take place chiefly from the four southern maritime provinces. The emigrants direct their course to every neighbouring country where there is any hope of finding employment and protection. They are excluded, like the European nations, from settling in Japan, on political grounds; the government of Cochin-China affords them no great encouragement, from the same reason, and the Dutch and Spanish governments of Java and the Philippines have always looked on them with much suspicion. Distance, and the existence of a dense and comparatively industrious population, exclude them from the British possessions in Hindostan, where there are only a few shoemakers and other artisans from that country, and these confined to Calcutta, Madras, and Bombay.

Every emigrant who leaves China does so with the intention of returning to it, although comparatively few are able to accomplish this object. The expense of emigration to the countries to which the Chinese usually resort, amounts to very little. Yet even the slender sum required is commonly paid from the fruits of the emigrant's labour on his arrival, and seldom in advance. They are invariably of the labouring classes, and their whole equipment for the voyage consists of little else than the coat on their back, a bundle of old clothes, and a dirty mat and pillow to sleep on. They no sooner land than their condition is wonderfully improved. They meet their countrymen, and find immediate employment in a congenial climate, where the wages of labour are perhaps three times as high as in China, and the necessities of life cheaper by half.

The Chinese are not only intellectually, but physically superior to the nations among whom they settle. A Chinese is at least two inches taller than a Siamese, and by three inches taller than a Cochin-Chinese, a Malay, or a Javanese, and his frame is proportionably strong and well built. Their superiority in personal skill, dexterity, and ingenuity, is still greater. The wages of a Chinese labourer at Singapore are eight dollars a month, and of a Malay four; thus proving the work of the former to be of double the value of that of the latter.

The different classes of Chinese settlers not only live apart and keep distinct from those of other nations, but from each other. There is a wide difference between

their character, habits, and manners, according to the provinces from which they proceed. The emigrants from the town of Canton, besides being addicted to mercantile pursuits, are the best artisans, and are much disposed to enter into mining speculations. It is they who are chiefly employed in working the silver mines of Tonquin, the gold mines of Borneo, and of the Malay peninsula, and the tin mines of the latter country, and of Banca. The Chinese of Macao, and the other islands, are held in very little repute by the rest of their countrymen, but those of the mountainous districts, who are numerous, are the lowest in rank. Their most frequent employment is that of fishermen and mariners; and it is from their ranks that European shipping, when in want, have occasionally received hands. Of all the Chinese, these are the most noisy and unruly.

The Chinese settlers, of whatever class, engage with much eagerness in agricultural employments, seldom, however, unless through necessity, as day labourers. They conduct, almost exclusively, the cultivation and manufacture of the catechu or terra Japonica in the strait of Malacca, the pepper cultivation of Siam, and the culture of the cane, and the manufacture of sugar in Java, Siam, and the Philippines. Differing materially from each other in manners, habits, and almost always in language and dialect, and entertaining towards each other provincial prejudices and antipathies, broils and quarrels, sometimes even attended with bloodshed, frequently break out among them. These are occasionally subjects of embarrassment in the European settlements; but nothing is to be apprehended from their systematic combination or resistance; for of all the Asiatic inhabitants of our eastern dependencies, the Chinese are the most obedient to the laws, and notwithstanding the superior amount of their property, and even of their numbers, afford the least employment to the courts of justice.

The emigrant population from China is of a peculiar description, consisting, for the most part, of adult males, and of very few women or children, a circumstance easily explained: The laws of China, which prohibit emigration in general, are a dead letter, as far as the men are concerned; but it is imperative in respect to women and children, or, perhaps, more strictly, the manners and feelings of the people themselves prevent the latter from quitting the country. The person who gives this part of the evidence, and who had resided many years in the British dependencies, states that he had never seen nor heard of a female among the emigrants, and never saw a Chinese woman, except at Hué, the capital of Cochin-China, where two or three were pointed out as objects of curiosity, who had been kidnapped and brought there when children. The emigrants, however, without scruple, form connexions with the females of the country, and the descendants of these repeatedly intermarrying with Chinese, are in time not to be distinguished from the genuine Chinese, either in features or complexion. But in countries where the settlers have been only recently established, the disproportion of the sexes is immense. Thus, out of the 6200 Chinese inhabitants of Singapore, the number of females is but 360, and even of these, the greater part are Chinese only in name. The number of emigrants who return to China, though considerable, is very small in comparison with the arrivals. Even of those, the greater number come back again. There are resident in the British settlements, Chinese emigrants, men of property, who have visited China, and returned with titles.

The evidence details a great number of facts relative to the culture and exportation of tea, highly worthy of notice. The excellence of the herb is attributed chiefly to the attention paid to its culture; hence it is, that though the tree itself is a hardy plant, thriving under a great variety of climate, the marketable commodity produced from it is very inferior in all other countries to that of China. Like the grape, it also differs in flavour from difference of soil and management, and there is as much difference between the choice teas conveyed overland to Russia, and those sent to Europe, as between the claret and Burgundy wines of France. It is also said that the flavour of the plant is much deteriorated by the sea voyage.—*Dublin Literary Gazette.*

TO SCOTLAND.

Scotland! the land of all I love,
The land of all that love me;
Land, whose green sod my youth has trod,
Whose sod shall lie above me!
Hail, country of the brave and good,
Hail, land of song and story;
Land of the uncorrupted heart,
Of ancient faith and glory!

Like mother's bosom o'er her child,
Thy sky is glowing o'er me;
Like mother's ever-smiling face,
Thy land lies bright before me.
Land of my home, my father's land,
Land where my soul was nourished;
Land of anticipated joy,
And all by memory cherished!

Oh, Scotland, through thy wide domain,
What hill, or vale, or river,
But in this fond enthusiast heart
Has found a place for ever?
Nay, hast thou but a glen or shaw,
To shelter furze or shelving
That is not garner'd fondly up
Within its depths of feeling?

Adown thy hills run countless rills
With noisy ceaseless note me,
Their waters join the rivers broad,
Those rivers join the ocean;
And many a sunny, flowery brae,
Where childhood plays and ponders,
Is freshen'd by the lightsome flood,
As wimpling on it wanders.

Within thy long-descending vales,
And on the lonely mountain,
How many wild spontaneous flowers
Hang o'er each flood and fountain!
The glowing furze—the "bonny broom,"
The thistle, and the heather;
The blue bell, and the gowan fair,
Which childhood loves to gather.

Oh, for that pipe of silver sound,
On which the shepherd lovers,
In ancient days, breathed out his soul,
Beneath the mountain's cover!
Oh, for that Great Lost Power of Song,
So soft and melancholy,
To make thy every hill and dale
Poetically holy!
And not alone each hill and dale,
Fair as they are by nature,
But every town and tower of thine,
And every lesser fort and shrine,
For where is there the spot of earth,
Within my contemplation,
But from some noble deed or thing
Has taken consecration?
First, I could sing how brave thy sons,
How pious and true-hearted,
Who saved a bloody heritage
For us in times departed;
Who, through a thousand years of wrong,
Oppress'd and disrespected,
Ever the generous, righteous cause
Religiously protected.
I'd sing of that old early time,
When came the victor Roman,
And, for the first time, found in them
Unconquering foemen;
When that proud bird, which never stoop'd
To foe, however fiery,
Met eagles of a sterner brood
In this our northern eyrie.
Next, of that better glorious time,
When thy own patriot Wallace
Repell'd and smote the myriad foe
Which storm'd thy mountain palace.
When on the sword of Bannockburn
De Bruce his standard planted,
And drove the proud Plantagenet
Before him, pale and daunted.
Next, how, through ages of despair,
Thou brav'd'st the English banner,
Fighting like one who hopes to save
No valued thing but honour.
How thy own young and knightly kings,
And their fair hapless daughter,
Left but a tale of broken hearts
To vary that of slaughter.
How, in a later, darker time,
When wicked men were reigning,
Thy sons went to the wilderness,
All but their God disclaiming;
There, hopeful only of the grave,
To stand through morn and even,
Where all on earth was black despair,
And nothing bright but heaven.
And, later still, when times were changed,
And tender thoughts came o'er thee,
When abject, suppliant, and poor,
Thy Injurer came before thee,
How thou did'st freely all forgive,
Thy heart and sword presented,
Although thou knew'st the deed must be
In tears of blood repented.
Scotland! the land of all I love,
The land of all that love me;
Land, whose green sod my youth has trod,
Whose sod shall lie above me;
Hail! country of the brave and good,
Hail! land of song and story,
Land of the uncorrupted heart,
Of ancient faith and glory!

R. C.

SIR DARBY MONAGHAN.

THE Duke of Rutland, when Lord-Lieutenant of Ireland, frequently indulged himself in incognito rambles, with a few boon companions, through the meaner parts of Dublin, in the course of which he occasionally met with strange adventures.

One evening, his grace, Colonel St Leger, and one or two others, having entered into a public-house in the *Liberty*, they found the landlord to be so comical a blade, that they invited him to sit down to supper with them. Darby Monaghan, who knew his grace by sight, took good care that the entertainment should be such as to give every satisfaction to his guests, and he contrived to season it with such an abundant flow of native wit and drollery, that they were quite delighted with him. His wine and whisky punch were so good, that by two in the morning they were all quite jolly, and ready to sally out into the street in quest of adventures. This, however, was prevented by the politic Darby, who contrived, by the humour of his songs, and the waggy of his jests, to fascinate them to the spot, until, one after another, they fell drunk under the table.

During their libations, and after Darby had said several good things in succession, the duke, in a fit of good humour, and by way of a joke, turned round to him, and said, "By Jove! landlord, you are a glorious fellow, and an honour to your country. What can I do for you, my boy? (Hiccup.) I'll *knight* you, my lad! so (hiccup again), down upon your marrow-bones this instant!" "Your grace's high commands shall be obeyed," said Darby, kneeling. The duke drew his sword, and, although Colonel St Leger endeavoured to prevent his carrying the joke too far, he struck him over the shoulder, and uttered the ominous words, "Rise up, Sir Darby Monaghan!" Darby, having humbly thanked his grace, and sworn fealty to the King of England in a bumper, an immense bowl of punch was ordered in; this was filled and refilled, until at length the whole party became blind-drunk, as before stated.

The weather being warm, and the great quantity of punch which they had drunk, prevented the toppers from feeling any inconvenience from the hardness of their couch, and they slept as soundly as they would have done on a down bed, either at the Castle or the Lodge. Darby, who, from long seasoning, was soon enabled to overcome the effects of the whisky, rose betimes, and having bustled about, soon prepared a comfortable breakfast of tea, coffee, and chocolate, for the sleeping partners of his debauch.

When all was ready, not liking to rouse them by shaking or otherwise, he stepped into the room upon tiptoe, and gently opened the window-shutters. The sun shining in full upon them, they soon awoke from their slumbers, wondering where they were. The landlord, who was listening at the door, speedily put an end to their suspense, by thrusting in his black head, and nodding to his grace, assuring him "that they were safe and sound,

and not a bone broke, in Darby Monaghan's own comfortable and fashionable *hotel*; also, that if his honour's grace and the other gentlemen would just shake themselves a bit, and slush their faces with a little nice cold spring water, they might fall to without any more delay, for there was a breakfast fit for a laird laid out for them in the next room."

This intelligence was received with much pleasure by the party, who, having put themselves in decent trim, adjourned to the breakfast room, where they found every thing of the best laid out in homely style; but what pleased them the most, was Darby's attention in bringing in a bottle of whisky under one arm, and one of brandy under the other. Pouring out several glasses, he presented them to each, according to their choice; taking the blessed Virgin to witness that a glass of good spirits was the best maid'cine ever invented for weakness of the stomach, after straitching it with punch the overnight.

Darby's courtesy was taken in good part; and after he had retired, the conversation turned upon his extraordinary humour. At length, Colonel St Leger, seeming to recollect himself, said, "I am afraid, my lord duke, your excellency made a bit of a blunder last night: you conferred the honour of knighthood on this same landlord." "Did I, by heaven!" exclaimed his grace. "That you did," replied the colonel. "Bless me, how unfortunate! why didn't you prevent me?" "I endeavoured to do so with all my might, but your excellency's arm was too potent; and I preferred seeing your weapon fall upon his shoulder, rather than have it thrust into me." "What an unfortunate affair!" exclaimed the duke, rising; "but I suppose the fellow doesn't recollect the circumstance more than myself: let us call him in. I wouldn't have such a thing reported at St James's for the world; I should be recalled, and be the laughing-stock of every one at the court. Zounds! to knight the landlord of a common punch-house! the thing is surely impossible."

"Both possible and true," replied the colonel; "but let us ring for him, and hear what he himself says about the matter." Darby, who was in attendance on the outside of the door, heard all that passed, and resolved to resist every attempt at depriving him of his newly acquired honours. On his entering the room, the following dialogue took place.

Duke of Rutland.—I say, landlord, we were all quite jolly last night?

Darby Monaghan.—Your honour's noble grace may say that same; we drank thirteen whacking bowls of punch amongst five of us?

Duke.—Ah! so we did, I believe—thirteen to the dozen—and you supped with us?

Darby.—Many thanks to your grace's excellency, Darby Monaghan did himself that same honour.

Duke.—No honour at all, my good fellow. But I say, Darby, do you recollect any thing particular that I did, in the way of joke, you know; some foolish thing, when we were all as drunk as fiddlers?

Darby.—Certainly, your dukeship may say that, any how. I daresay the colonel well remembers you filling up the last bowl from the whisky jug, instead of from that containing the hot water. By the powers I could not stand that; it set me off, whizzing like a top, and I doesn't recollect one single thing after we emptied it.

Duke (laughing).—Oh, then, you don't remember my drawing my sword, and threatening to run you through the body?

Darby.—The Lord above for iver preserve yer dukeship's highness from cruel murder and sudden death all the days of yer life! I don't remember any such thing; but I remember well the whack yer excellency's royal highness gave me with that same sword over my shoulder, when ye bade me "rise up, Sir Darby Monaghan."

Duke.—You do? eh! But that was all in jest, you know, Darby, and so we must think no more about it.

Darby.—Long life to your highness! but I took it in right earnest; more by token that my shoulder aches at this moment with the blow; but I mustn't mind that, for it was given upon an honourable occasion, and received with good will—so, thanks to yer excellency for all the favours, now and hereafter.

Duke.—But you don't presume to suppose, my good fellow, that I actually conferred upon you the honour of knighthood?

Darby.—By the powers! your highness, but I do. Sure I wouldn't be after doing your highness such discredit as to think ye meant to break yer royal word to man or mortal.

Duke.—Oh, the devil! (whispering.) I say, colonel, what is to be done?

Colonel (whispering).—Give him some birth, and make him promise to say nothing about the frolic.

Duke.—Well, Darby, I don't mean to act scurvily towards you. I can give you a tidewater's place, or something in the excise, that will bring you in about one hundred and fifty pounds a-year, and make you independent for life.

Darby (kneeling, and kissing the duke's hand).—Let me go on my merry bones once again, to thank yer royal highness for being so good and marcful to poor Darby Monaghan! He'll niver forget to remember to pray for yer excellency to the blessed saints, on Sunday or holiday.

Duke.—Well, then, Darby, it is settled that you give up the title, and that nothing shall ever be said about last night's adventure?

Darby.—Give up the title, yer grace, and not be called sur! after all? I thought the hundred and fifty pounds a-year was to keep up my style as a true and loyal knight.

Duke.—No, faith! you sha'n't have place and title too—so choose without delay.

Darby (pausing).—Well, yer grace, if yer excellency pleases, I'd rather keep the title; for, d'ye see, it'll be such a wonderment for a punch-house to be kept by Sir Darby Monaghan, that I'll soon have all the custom of Dublin city; and that'll be better than a tidewater's place, any how.

Duke (laughing).—Well, then, without more argument

about the matter, you shall have a place of about two hundred and fifty pounds a-year, and you must give up your knighthood this instant.

Darby (going out).—Praise your excellency, then, I'll just step up stairs, and ax her ladyship's advice; and, I daresay, she'd rather have the money. So I'll inform your honour's grace in a twinkling.

Her ladyship was accordingly consulted on this important question; and she wisely, and without hesitation, voted for the income of two hundred and fifty pounds, which they enjoyed for many years. The title, too, stuck by them till the last; for after the duke's departure from his vice-royalty, the affair was bruited abroad, to the great amusement of the middle and lower orders in Dublin, who never failed to address the fortunate couple by the appellations of "Sir Darby and Lady Monaghan."—*Clubs of London.*

THE ELEPHANT.

To give a description of the elephant would seem superfluous: man has been familiar with it from the remotest times; it has been the auxiliary of armies, the pride of princes, the servant of merchants, and one of the chief attractions of every menagerie. All sorts of persons, from the sage to the showman, have thus combined to set forth the appearance, the magnitude, and the sagacity of the elephant, till, if the brute that roams the thick forests of India could read, it would really not know its own history. From so many and so interested and ignorant sources, it would be vain to expect any thing either very true or very consistent; and probably the most wild and wretched romance in the circulating library is not a more wide caricature of human nature, than the majority of written accounts are of the elephant.

As the elephant is the largest, and, estimating him as a mass in motion, the most powerful of land animals, there has been a great tendency to endow him with those superior attributes, which fancy, without regard to the facts, is so very apt to associate with mere magnitude. He has been styled the wisest and most lofty-spirited of brutes, and his reasoning powers have been stated as more than matter of imputation. As to the reasoning, one fact is decisive; the elephants of the present day have no more understanding than they had in the time of Darius. As for the independence, again, it has just as little foundation; the elephant is at first tamed by fear and starvation; and his motions are directed by an iron hook, which his driver thrusts into his forehead to push him on, and into his ear to turn him aside. The story of their not breeding in confinement, from delicacy or haughtiness, or any other intellectual cause, is not true, as they have bred in that state both in ancient and modern times; and the cause of their doing it so seldom is physical—they are not sufficiently fed, and too hard worked. Even what is told of a sexual paroxysm taking place at a particular season annually, in male elephants, is not true; for in their native forest the elephants breed at all seasons; and it has been ascertained that the period of gestation in the female is about twenty months and a half. The age to which they live has not been fully ascertained; but there is reason to believe that it is not less than two hundred years. According to the observations that have been made, the maternal feelings of the elephant are very blunt.

The form and covering of the elephant are well fitted for enabling it to make its way through jungles and forests. Its head forms a battering ram; and in order that the brain may not suffer pain from the concussion, the frontal sinuses are extended to two large cavities. The projections formed by those cavities are probably one of the causes of that imaginary wisdom which is imputed to the elephant, as they lead those who are not acquainted with its structure, to suppose that the cerebral mass is anteriorly very much developed. But the "sagacious facial line" has nothing to do with the brain of the elephant, that organ being remarkably small, not more than one twenty-third of that of the human subject, in proportion to the weight of both. And yet the senses of the animal are wonderfully acute. Of the sense of taste in this animal, we know less than of any of the others; but the great partiality of the elephant for sugar canes, for the sake of which it leaves the forest, and ravages the cultivated fields, and its fondness for sweet things, show that it has a power of election in its eating. The sense of sight is very quick, though, from the position of the eyes, and the shortness and stiffness of the neck, it is limited in its range backwards, except near the ground. It sees the rider, or the load upon it, with difficulty, if at all. Its hearing is very acute, and thus it has a very great discrimination of sounds; and there have been instances of one once domesticated escaping, be-

ing taken again in the usual manner, and at once obeying its old keeper, though till then it had given no sign of ever having been in human training, or having the least knowledge of the snare in which it had been formerly caught. Indeed the principal sagacity of the elephant seems to depend upon the power of following a certain sound with a certain act. An elephant, which was some years ago butchered in London, probably in consequence of ignorance on the part of those about it, listened to the voice of its keeper, even when it had been irritated and mortally wounded.

The sense of smell is very wonderful, and is no doubt the one by which the course of the animal is chiefly guided in those places where sight would be useless, and hearing of little more avail, on account of the rustling that itself must make. Thick as the hide of the elephant is, it is far from invulnerable. The insects of the jungles give it a great deal of annoyance, and put it to many shifts in order to get rid of them. Indeed, when left to itself, and where it has plenty of food and water, the hide of the elephant is soft; and it is dry and chapped in confinement, only because the animal does not get proper food, or enough of exercise to promote digestion. With the exception of the human hand, and the express organs of feeling in animals that have to grope for their way and their food, there are few organs in nature in which the sense of touch appears to be more acute and delicate than in the trunk of the elephant, especially in that part of it which serves as a hand.

Notwithstanding its great strength, and the formidable weapons with which nature has furnished it, the elephant is a harmless, and even a retiring animal; and, unless when alarmed for its own safety, it wages war upon no other living creature. The extensive and thick forests are its chief abode; and the places of India where it is most abundant, are the moist forests in the south-east of Bengal, and some parts of the western Ghats, but more especially the former. The forests on the Tippera hills, on the south of the Silhet district, have long been the place where the principal continental supply of elephants has been obtained; and there they are still numerous, being found in herds of about a hundred in number. They are, like many of the other animals that live entirely upon vegetables, gregarious; and the herd are generally found to follow the oldest pair as leaders, and to go readily wherever they lead the way. In their marches through those forests, tangled as they are with underwood, sight would be of little avail; and therefore their means of communication are scent and sound. Food, friends, and foes, appear to be detected with great certainty, and at a considerable distance, by the former; and the latter also admits of considerable variety. An elephant has three cries. The one is rather clear and shrill—a trumpet note, produced wholly by the trunk, and emitted when the animal is in good humour, and all is safe. The second is a growl or groan, issuing from the mouth, and is the cry of hunger, or an intimation to the rest when one has come upon an abundant supply of food; the third sound is loud as the roaring of the lion, and is the war-cry by which the animal prefaces his own hostilities, or calls his associates to his aid. They are seldom found far from each other, unless in the case of males that are expatriated, as is the case with deer and some other animals; and those often quit the forest, and are caught by using three or four tame females as a decoy. Even alone, in these cases, the beasts of prey—even the tiger, notwithstanding his agility and strength—will hardly venture to attack the elephant. The male receives him on his tusks, tosses him into the air, and stands prepared to stamp his fatal foot upon him the instant that he touches the ground. The female elephant has no tusks upon which to receive an enemy; but she has the art to fall upon him, and crush him by her weight.

In their native forests, where they are in herds, the elephants are invincible to all enemies but man. If one gives an alarm, others hasten to the spot, and where they act in concert, the carnivorous animals keep their distance. In those places man is the only inhabitant of the earth by whom they can be subdued; and he owes his superiority chiefly to an element which the lower animals have never been able to engage in their service. Man, even in his most savage and uncultivated state, rubs one piece of wood against another, till one or both be ignited; he applies the match so lighted to a bundle of sticks, or to the reeds, brushwood, or grass, and the stoutest and most daring animals own his sway, and shrink from this the symbol of his dominion. When we reflect on the power and the security which this single and simple operation of the lighting of a fire gives to a man in those parts of the world that are infested by ferocious animals, we cannot help being struck at the vast superiority which the possession, even of the lowest degree of reason, has over the perfection of mere animal courage and strength.—*Picture of India*, 2 vols. 8vo. 1830.

EDINBURGH: Published, weekly, by W. and R. CHAMBERS, 19, Waterloo Place; ORR & SMITH, Paternoster-row, London; and GEORGE YOUNG, Dublin. Agent in Glasgow, JOHN MACLEOD, 20, Argyle Street; and sold by all other Booksellers in Great Britain and Ireland.

Subscribers in town may have the paper left at their houses every Saturday morning, by giving their addresses at 19, Waterloo Place. Price of a quarter of twelve weeks, 1s. 6d.; of a half year of twenty-four weeks, 3s.; and of a year, 6s. 6d. In every case payable in advance.

From the Steam-Press of W. and R. CHAMBERS.

PRICE THREE HALFPENCE.

CONSULS.

THE population of a large town is perpetually receiving accessions from the country—not for the purpose of increasing the aggregate of inhabitants, but to supply the waste of existence which takes place in such a scene, and to furnish a better selection for the peculiar offices and business of a city than what could be obtained from the successive generations of the ordinary inhabitants. Nothing can be more clear than that the youths born and bred in a large city have a less chance to establish themselves in its first-rate lines of business, than the lads who come in from the country as adventurers; the fact being, that the latter are a selection of stirring clever spirits from a large mass, while only the same proportion of the former are likely to possess the proper merit or aptitude. Besides, the town-bred lad is apt to have some points of silly pride about his status in society; he cannot do this and he cannot be that, for fear of the sneers of the numerous contemporaries under whose eyes he is always walking. But the gilly, hot from Banff or Inverness, who comes into the town, "with bright and flowing hair," rugging and riving for a place in some writer's office, or elsewhere—why, the fellow would push into the most sacred parts of a man's house, like Roderick Random, and at the most unconscionable hours, in search of some prospective situation; and when he has got it, what cares he about what he does (within honesty) in order to advance himself, seeing that all who ever knew him before are on the other side of the Grampians? Thus the sons of the respectable people of large cities are constantly retiring from the field—some to the East Indies—some to the West—some evanish nobody knows how—while their places are taken by settlers from all parts of the country, whose children, in their turn, give way to fresh importations. Then there is a constant tide towards the capital, of all kinds of rural people, who, having failed to improve their fortunes in the country, are obliged to try what may be done in the town. A broken-down country merchant sets up a grocery shop in some suburb—a farmer who has been obliged to relinquish his *dulcia arva*, sets up an hostelry for carriers, and so forth. Every recurrence of Whitunday and Martinmas sends in large droves of people on the tops of heavy carts, to pitch their camps in Edinburgh; many of them with but very uncertain prospects of making a livelihood when they get there, but yet the most of them astonished a year or two after to find that they are still living, with the children all at the school as formerly, although, to be sure, the "reeky town" can never be like the green meadows and dear blue hills which they have left behind in Menteith, or Ayrshire, or Tweeddale. What change, to be sure, to these good people, is the close alley of the Old Town of Edinburgh, the changeless prospect of house-tops and chimneys, and the black wall opposite to their windows, ever casting its dark shade into their little apartments, for the pleasant open fields in which they have sown and reaped for half a lifetime, and where every little rustic locality is endeared to them by a thousand delightful recollections! But yet it is amazing how habit and necessity will reconcile the mind to the most alien novelties. And, even here, there are some blessings. The place of worship (always an important matter to decent country people in Scotland) is perhaps nearer than it used to be. Mr Simpson's chapel in the Potterrow is amazingly convenient. Education for the children, though dearer, is better and more varied. There is also a better chance of employment for the youngsters when they grow up. Then Sandy Fletcher, the carrier, goes past the door every Wednesday, with a cart-load of home reminiscences, and occasionally a letter or a parcel from some friend left at the place which they have deserted. By means of this excellent specimen of corduroyed honesty and worth, they still get all their butter and cheese from the sweet pastures of their own country-side, so that every meal almost brings forward some agreeable association of what, from feeling as well as habit, they cannot help still calling home. Then it is always made a point with them to plant themselves in an outskirt of the town, corresponding to the part of the country from which they come, and where they think they will have at least a specimen of the fresh air. A Clydesdale family, for instance, hardly ever thinks of taking a

house (at least for the first year or two) any where but in the Grassmarket, or about Lauriston, or the Canal Basin. People from East Lothian harbour about the Canongate, Bristo Street and the Causeway-side are appropriated indefeasibly to settlers from Selkirkshire and Peeblesshire. Poll the people thereabouts, and you will find a third of them natives of those two counties. In fact, the New Town, or any thing beyond the Cowgate, is a kind of *terra borealis incognita* to folk from the south of Scotland. They positively don't know any thing about those places, except, perhaps, by report. Well, it must certainly be agreeable, if one is banished from the country into a town, at least to dwell in one of the outlets towards that part of the country; so that the exile may now and then cast his thoughts and his feelings straight along the highway towards the place endeared to him; and if he does not see the hills which overlook the home of his heart, at least, perhaps, hills from which he knows he can see other hills, from which the spot is visible—the long stages of fancy in straining back to the place

"—He ne'er forgets, though there he is forgot."

There is one other grand source of comfort—in fact, an indispensable convenience—to people from the country living in a large city, namely, CONSULS. Every person in the circumstances described must be familiar with the character and uses of a CONSUL, though perhaps they never heard the name before. The truth is, as from every district of broad Scotland there are less or more settlers of all kinds of ranks and orders, so among these there is always one family or person who serves to the occasional visitors from that part of the country, as well as to the regular settlers, all the purposes which a commercial Consul serves in a foreign port. The house of this person is a *houff*, or place of especial resort, to all and sundry connected with that particular locality. It is in fact the Consul-house of the district. Sometimes, when there is a considerable influx from a particular place, there is a Consul for almost every order of persons connected with that place, from the highest to the lowest. The Consul is a person—generally an old lady—of great kindness of disposition, and who never can be put about by a visit at any time upon the most vaguely general invitation. Generally, a kind of open table—a tea-table it is—is kept every Sunday night, which is resorted to by all and sundry, like an "at home" in high life; and though the Consul herself and some of her family sit on certain defined and particular chairs during the whole evening, the rest are tenanted by relays of fresh visitors almost every hour, who pay their respects, take a cup, and, after a little conversation, depart. In general, the individuals resorting to these houses are as familiar with every particular of the system of the tea-table—yea, with every cracked cup, and all the initials upon the silver spoons—as the honest Consul herself. Community of nativity is the sole bond of this association, but hardly any could be stronger. A person from the country takes little interest in the gossip of the city, important as it may sometimes be. He likes to hear of all that is going on in the little village or parish from which he has been transplanted. All this, and more, he hears at the house of the Consul for that village or parish, the same as you will be sure to find a London newspaper in the house of the British resident at Lisbon. Any death that may have happened there since his last visit—any birth—any marriage—any anything—he gets all in right trim at the Consul-house, with all the proper remarks, the whole having been imported on Thursday in the most regular manner by the carrier, or else on some other day by a visitant, who, though only a few hours in town, was sure to call there. At the Consul-house you will hear how the minister is now liked—who is likely to get most votes in the coming election—from whom Mrs ——— bought her china when she was about to be married—and the promise of the crops, almost to a sheaf or a potato. But the topics are of endless variety. One thing is remarkable. The most determined scandal is bandied about respecting their ancient neighbours; and yet they all conspire to think that there is no sort of people to be compared with them in the mass. They will let nobody talk ill of them but themselves. There is sometimes a considerable difference in the characters and ranks of the indi-

viduals who frequent a Consul-house. Perhaps you find, among persons of higher degree and more dignified age, apprentice lads, who, being the children of old acquaintances of the Consul, are recommended by their mothers to spend their Sunday evenings here, as under a vicarial eye of supervision, and being sure to be out of harm's way in the house of so respectable a person. These stolid youths, with their raw untamed faces, form a curious contrast, occasionally, to the more polished individuals who have been longer about town, such as writers' clerks or licentiates of the church. Possibly they will sit you out five mortal hours in a Consul-house, without ever speaking a word, or even shifting their position on their chairs, staring with unvaried eyes, and hands compressed between knees, right into the centre of the room, and hearing all that is going on as if they heard not. At length the young cub rises to go away, and the only remark is, "Well, Willie, are you going home? Good night." After which, the Consul only remarks to the adults around her, "That's ane o' John Anderson's laddies—a fine quiet callant." But this holds good only respecting Consuls in a certain walk of life. There are houses where people of very high style from a particular district are wont to call and converse; and there are dens in the inferior parts of the town, to which only serving girls, or boys (there is no rank among boys), resort. Every place, every rank, has its Consul. And not only is the Consul valuable as an individual who keeps a Sunday-evening conversazione. She actually does a great deal of business for the particular district which she represents. If a townsman wants a gown dyed, or to obtain swatches of some new prints, or to purchase any peculiar article which requires some address in the purchasing, then is the Consul resorted to. A little square inexplicable epistle, with not nearly enough of fold to admit a wafer, and the phrase "for goods" on the corner, supposed to be a kind of Shibboleth that exempts letters from the laws of the Post-office, comes in with the carrier, requesting that Mrs ——— will be so good as go to this or that shop, and do this and that and t'other thing, and send the whole out by return of Pate Fairgrieve, and the payment will be rendered at next visit to town. Thus, the Consul is a vast commission agent, with only this difference, that she makes nothing by it to compensate her immense outlay of capital. The duties, however, of the Consulate are their own reward; and we doubt if Brutus, who first assumed the office, bore it with a prouder head, or more satisfied heart, than many individuals whom we could point out. Henceforth, we do not doubt, people will refer to the days when such and such a person was Consul for their native village, in a style similar to the ancient chronology of Rome; and "Consule Tullo" itself will not be more familiar or more memorable language, than "in the consulate [shall we so suppose?] of Mrs Bathgate!"

POPULAR INFORMATION ON NATIONAL INSTITUTIONS.

SCHOOLS.

It is now fully understood among inquiring minds, that in almost no civilised country in Europe is education less generally diffused, or ignorance more prevalent, than in England. It has happened through the extreme carelessness of those to whose management the country was committed, both in a bodily and spiritual sense, as well as from the dreadfully keen pursuit of gain and animal comfort which every where prevails, that the great mass of the people, whether in trade or agriculture, are totally ignorant of the first rudiments of letters, and have not the smallest knowledge of the art of writing. I have often been astonished at the quietness of the intelligent newspaper and periodical press under this melancholy state of things. The writers of these useful productions must have ample means of being acquainted with, and in some degree the power of reforming, an abuse which makes the heart of the philanthropist sicken, and that of the political economist almost despair. It is a fact perhaps not generally adverted to, as its contemplation is somewhat unpleasant, that the Irish nation have a much greater appetite for literary instruction, and are much more generally educated, than the English. It

is related by the Rev. C. Anderson, in his excellent work on the Native Irish, that the people of Ireland, of all grades and persuasions, are extremely desirous of having elementary instruction communicated to their children. Such, however, has been the lack of books and schools, he continues, that many thousands of children have been taught in churchyards by peripatetic teachers; the letters of the epitaphs being their only primer, and a piece of chalk and the grave-stones being their only pen and copy-book. In Ireland, also, there have been instances of men communicating a knowledge of reading to individuals, only on condition that each would teach other ten, and thus, in the absence of all attention on the part of the state, a knowledge of letters has been diffused over many of the wildest districts of our unhappy sister kingdom. Now, in England there is nothing of this species of feeling. The desire for furnishing children with the elementary branches of education can be said to exist only among those classes who are at perfect ease in their circumstances. There will be found in England, perhaps, two or three millions of parents who would not forego the indulgence in a single draught of beer, were they thereby to have the power of educating the whole of their family for a twelvemonth. Somehow or other, "school learning," as it is called, is not supposed by these and other parents to be a thing of any value to their offspring, or suited to their habits of life, and few seem to be at pains to convince them of the contrary. The apathy of the corporate bodies of England is one of the chief causes of this extraordinary ignorance of the people. It cannot be but known to the clergy, to statesmen, and to the legislature generally, that four-fifths of the industrious classes of the community can neither read nor write; and it cannot escape notice, that the larger proportion of those convicted of crimes, both before the sessions and petty judges, are in total ignorance of all branches of scholastic learning. Yet, with this knowledge, and the most appalling deterioration of the people, nothing is done—that is to say, on an efficient general principle; for the institution of charity and Sunday schools has little effect on the great strongholds of ignorance, which are every where observable.

I have no desire to harrow up, with any thing like bitterness, the complacent sloth of those who ought to take the lead in instituting a great national system of education in England; but as one who is acquainted with the beneficial educational institutions of his own country, and would, above all things, wish to see them imitated in the southern part of the island, I must be permitted to bring forcibly before the English their sad deficiencies in the matter now under discussion, and endeavour to rouse them into a state of beneficial exertion. In the first place, the temptation to keep children from school, by the wages which they can earn even while in the tenderest years of youth, ought at once to be removed by a legislative enactment, calculated to prevent the employment of children in any kind of manufactory till they be ten years of age. There may appear to be a harshness in this regulation, but the safety of the commonwealth and the character of the nation, in a certain sense, depend on its exercise. Simultaneously with this arrangement, a school ought to be established in every parish, or lesser division, and supported in nearly the same manner as is practised with such triumphant success in Scotland. The funds to support institutions of this description cannot require any length of time to be discovered; while the obtrusion of such seminaries on every little vicinity would soon incite a desire among the people to have the minds of their children imbued with the elements of instruction and useful knowledge. I may now bring forward a few useful particulars, illustrative of the nature of the Scottish schools, and of the taste for instilling a knowledge of letters, so characteristic of the nation.

It would be extremely difficult to convey to the mind of an Englishman any adequate idea of the ardent desire which burns in the heart of Scottish parents to give their children a knowledge of the rudiments of scholastic education. So universal is the principle, that the humblest, nay, almost the most vicious and abandoned, would consider themselves guilty of a serious crime, and labouring under an indelible disgrace, if they did not procure for their offspring a knowledge of reading and penmanship; and, except in some remote parts of the Highlands, a human being above the age of childhood is hardly to be found who cannot read his Bible or a newspaper, or unable to subscribe his name; while there are very few, even in the middle ranks of life, who have not enjoyed the advantages of a classical education. To accomplish the object of this passionate desire, families will deny themselves the use of many a luxury and necessary in sustaining life, and poor widowed women will toil night and day, in all seasons of the year, to find the means of educating their children. The feeling is indeed a psychological curiosity in its way, and might attract the investigations of the inquirers into the course of human action.

The establishment of parochial schools in Scotland was begun to be agitated by Knox and other reformers, and something was done in the reigns of James VI. and Charles II. in order to compel the erection and support of such institutions by the landholders. Yet nothing satisfactory was arranged till the Revolution had given an impetus to the public mind. The old laws were revised, and in 1696 an act of Parliament under William III. was passed, appointing a school

to be settled in every parish in Scotland, and compelling the salaries of the masters and other expenses to be liquidated by the landholders. The Presbyterian clergy having obtained the power of supervising the schools, warmly espoused the enactment, and to their fostering and persevering care the country has been much indebted for the success of the institution. Acts of Parliament since 1696 have considerably enlarged the salaries of the parochial schoolmasters, and otherwise bettered their condition. Their salaries are nominally fixed at so much grain, which being computed at the average market prices of so many years back, the amount is paid in money, each landholder paying his proportion. The salaries now vary from about £20 to £35 per annum, exclusive of a neat cottage and garden. They also receive school fees from pupils, but these are generally very small, and are regulated by the clergy and landowners, who have the complete control of the establishment. The fee for reading is now in general two shillings and threepence—writing, about a shilling additional—and these, included with arithmetic, three shillings and sixpence, a-quarter. If algebra or practical mathematics be added, another small charge is made. A very common charge for instruction in Latin is five shillings, and French the same sum, per quarter. Schoolmasters may thus double or treble their salaries; and their condition is bettered by their acting as clerks to the church session, precentors, &c. A number also teach psalmody. What are called the fine arts do not form a branch of education in the parish schools. In a number of the schools, also, Latin is not taught. The poor of the parish are taught gratuitously, and are put on the same footing in the schools as the other children.

The parochial schoolmasters of Scotland form a valuable and respectable body of men, who, in consideration of their toils, are very inadequately provided for. They are, in almost every instance, like their brethren the clergy, drawn from the lower ranks of the people, and have been pushed forward at some little expense to their parents, and often of themselves; as teaching is frequently an after-thought, arising from physical incapacity, or a desire to rise above the common ranks. In many instances the profession is hereditary, and in a number of cases it is made the preliminary to a living in the church, though this practice is now discontinued. The schoolmasters, on their admission by the landowners and Presbytery, undergo examinations as to their ability and moral character; and, by the law of the country, they are called on to subscribe the Confession of Faith of the Scottish Kirk.

While the country parishes of Scotland are thus provided with a ready and cheap means of education, it is very unfortunate that in the large populous cities there are no institutions of this description. This is a serious error in the Scottish national system. One of the ministers of the metropolis, in his statement in the recent reports of the Scottish clergy to Parliament regarding the schools, alludes to this deficiency in these words:—"Some legislative provision in burghs and large manufacturing towns, corresponding to the schools in the landward parishes of Scotland, and adequate to the cheap education of the poorer inhabitants, has become indispensably necessary to uphold the character and prosperity of the country. To this subject the magistrates have, in general, been commendably attentive; but the expenditure required has, in many cases, overgrown their means, and the legislature can alone supply the defect." To this statement I give a cordial assent; for the principal towns being devoid of endowed schools on the parochial plan, education is procured with great difficulty by the poorer class of inhabitants at private seminaries. Charity and Sunday schools have certainly been established to remedy the evil, but a great deal in this way has yet to be done in Edinburgh, and most other large towns. If these places be destitute of such powerful accessaries to the diffusion of knowledge, the case of the greater proportion of the second, third, and fourth-rate towns, is very different. In these places, education is on the best possible footing. Each possesses a parish school for the plain elements of education; and a grammar school for Latin, Greek, and other higher branches of a classical education. It is to this latter description of schools I would beg particularly to direct the attention of my readers in England, for they have hitherto been unaware of their existence or character. The Scottish grammar schools occupy, in some measure, that situation which is held in England by "finishing seminaries for young gentlemen," and which dispense education, at an enormous price, to the children of the upper ranks. These Scottish institutions are under the immediate patronage and supervision of the town-councils and magistracy, who, though frequently an ignorant enough class of men themselves, take no small pride in securing respectable teachers for the schools under their charge, and in the selection of whom they are assisted by the clergy and others. The masters are supported partly by small salaries from the town funds, and partly by fees. These schools are resorted to by pupils who have finished their education at the parish schools, which may be at the age of ten or eleven years, and are attended by boys boarded with the masters. All are taught together, and by this means a very beneficial intermixture of ranks takes place of boys who have been sent from cities and foreign places, and the natives of the towns and country districts. Friendships

are hence perpetually formed among different classes of society, which terminate only with existence, and associations are created in the minds of young men relative to their early haunts and acquaintance, which rarely wear out, though the business of life may compel their emigration to the most distant quarters of the globe.

No kind of schools has been so carefully attended to, and improved as occasion required, as these institutions. The payment of salaries by the towns has had the effect of considerably lowering the price of classical education. As a specimen, Latin is usually taught for, at most, 7s. 6d. a-quarter. Boarders pay for the whole routine of study according to age and other circumstances. In order that the young men from the parish schools may not lose their previous elementary education, they continue to be taught reading, writing, and arithmetic, at the former low terms. The general charge for boys, including board and education, varies from £25 to £40 per annum. At present there is an obvious competition of grammar schools throughout the country. As many of the burgh towns have little or no trade, they are excellently adapted, from their retired characters, for the possession of such establishments. Examinations are made once a-year (generally in August) by a number of the clergy of different persuasions, the magistrates, and gentlemen invited for the occasion. Prizes in classical books are given, and the vacation which follows usually lasts for a month. These, and all other schools, are always open to visitors; what is called *fagging* is totally unknown. In Edinburgh, Glasgow, Perth, and some other large towns, these establishments are called High Schools, as they are under a regular series of masters, and carry on education to a greater height, though at a much greater expense. I regret that my limits prevent me from laying before my readers the outlines of the various courses of study and modes of management, for they do great credit to the national character, and might be advantageously imitated in the south. These grammar and high schools serve as preparatory seminaries for young men intended for a collegiate education; but in a far greater number of cases they are attended by boys whose occupations are to be of a trading and mercantile nature, and who are not sent to the colleges. In nearly all the schools, instruction in religious duties forms an object of careful attention.

The whole tenor of education in Scotland, though confessed to be the best in practice, and though having the effect of distinguishing Scotsmen in whatever country they are found, is not without its faults and deficiencies. Here, as every where else, the art of teaching boys to think or reason has not been introduced on proper or rational principles. Education is still considered an exercise of memory, and it very frequently happens that the "best scholar" turns out the dullest man, and *vice versa*. But this defect is universal, and is only beginning to attract the notice of intelligent men in different parts of Europe.

MAHOMET ALI.

I do not know any species of intelligence which could communicate such a thrill of delight throughout Christendom, as that which would inform us of the surrender of Palestine and Syria by the slothful and sanguinary Turk to the conquering arms of a civilised power. Ever since these unfortunate countries were degraded and disgraced by the settled residence and sway of Mohammedans after the departure of the Crusaders, they have ceased to be an object of political strife among Christian princes—have been almost unheard of, except by the accounts of adventurous travellers—yet have never been forgotten by the reflective, or supposed to be totally lost to the renewed influence of that benign faith which was first promulgated in their rugged mountain recesses, and along the shores of their interesting lakes and rivers. The reform of the Turkish empire, partly effected by the present sultan, but, in particular, the ambition and desire for conquest of the intelligent Pacha of Egypt, give cause to imagine that the restoration of the Holy Land will be accomplished much earlier than we had any reason to anticipate. Mahomet Ali, who has been for some years the chief of Egypt, and nominally a Pacha of the Sultan, is one of the most extraordinary men of the present age; and should he completely subjugate Syria and Palestine, as there can be little doubt he will, these long abused countries will, in a brief space of time, be as open to the visits and settlement of Europeans as any civilised territory we are acquainted with. This being effected, what may we not expect to follow? Roads will be opened up; commodious inns and conveyances established; tours to Jerusalem, and through the scenery consecrated by the events recorded in the sacred Scriptures, will be of easy accomplishment; and the religion of Christ will once more openly be preached in the temples on Mount Zion. But all this in the meanwhile depends on the success of the intrepid Mahomet Ali, whose operations may be traced in the newspaper accounts of the day, and which it is not my province to detail.

As little, I believe, is generally known about this person, on whom so much good now depends, I shall take the liberty of condensing an excellent account of his life and actions, written by a correspondent of the Examiner:—

"The Pacha of Egypt was originally only a com-

man soldier amongst the troops raised in Albania, and by the vigour of his arm, by his talent and enterprise, he rose to be the Pacha of Egypt, one of the highest posts of honour in the whole Turkish empire. Such promotion in Turkey is not very extraordinary, for there are no hereditary honours; and as the Sultan is the heir of all who die in office, there is but little hereditary property. Accordingly, persons originally in the lowest station, constantly rise to the highest rank in the empire, and the sons of the greatest Pachas descend to a low condition. But Mahomet Ali, the Pacha of Egypt, on getting the command of that province, soon showed that he was no ordinary man—that he was not one who would travel in the beaten paths of ignorance and prejudice, and the changes which he has wrought in Egypt, although far from being equal to what a still greater degree of knowledge and benevolence would have effected, are utterly astonishing as coming from an originally uneducated Turk. He soon succeeded in establishing a regularly paid and disciplined military force, instead of the irregular and tumultuary bands of men, serving as soldiers in Turkey; and by their help, he soon put down all bodies of robbers and plunderers, and rendered life and property perfectly safe throughout all the land of Egypt. The remnant of the Mamelukes, that singular military body, which, since the days of Saladin, had governed Egypt, he annihilated, it must be confessed, by means but little consonant to our ideas of humanity, but still he did completely effect his purpose, and he made himself the sole and uncontrolled lord of the land of the Pharaohs, Ptolemies, Cæsars, and Caliphs. Travelling from one end of Egypt to the other is now as safe as in any kingdom of Europe; and foreigners, coming either for commercial or scientific purposes, feel themselves perfectly secure.

Having rendered the commerce of Egypt perfectly safe, he next set about rendering the agricultural productions such as would command a profitable return on exportation to foreign lands. He soon became aware that Egypt, possessing almost throughout a great depth of alluvial soil, and annually fertilised by the slimy inundations of the Nile, and warmed by a sun all but tropical, inasmuch as the southern part just reaches within the tropic, might be made to rival the richest lands of the eastern or western world; and the expense of supporting an Egyptian fellah to till the ground was still less than that which would feed and clothe a West Indian negro. Mahomet accordingly caused extensive tracts of Egypt to be cultivated with sugar and cotton. In these operations he availed himself of the science and talents of natives of Europe, and Christians of enterprise and talent found patronage and profitable service under a Mahometan prince. The value of the exports of Egypt was prodigiously increased, but Mahomet did not allow the cultivators to enjoy except a small portion of the advantage. He himself monopolised the whole trade. He compelled the cultivators to deliver over to his agents the whole of their produce at his own price; and this produce, by means of his agents, he sold to the European merchants; and to secure himself against the effects of any combination at Alexandria, to keep down the price, he sent his agents to France and England to dispose of his goods, and hence the cotton of Egypt has long been a regular article of trade in the prices current of Liverpool and Marseilles.

As the chief support of all power, Mahomet set about placing his army on a footing equal to the improved knowledge of the times. Instead of the tumultuous, undisciplined, scarcely regimental hordes of men, without uniform, and armed only with the musket and sabre, Mahomet caused his troops to be formed into regiments, battalions, and companies, like European troops; to be clothed in uniform, to be armed with gun and bayonet, and to be taught European tactics. To effect this, he engaged in his service European officers; and the cessation of the great wars in 1814 made it easy for him to obtain a supply of skilful warriors to any number. His cavalry and artillery were put on a footing equal to the infantry, and the army of Egypt on parade for review soon appeared equal in discipline and efficiency to an equal number of European warriors. Schools for instruction in the sciences necessary for war, and manufactures of arms and ammunition, were also established.

The marine of Egypt was also put upon a formidable footing, and displayed a force of line-of-battle ships and frigates far beyond what could have been expected from a country of a population supposed to be less than three millions of people; and the fleet was kept in a state of discipline corresponding with that of the land forces.

Being well aware that the superiority of modern armies arises from the science of the leaders, the Pacha has endeavoured to supply skilful officers for his troops, by means of an academy, in which instruction is given, chiefly by European masters, in the various branches of knowledge. Young men of marked talent have also been selected, and sent, chiefly to France, and some to England, for improvement. Knowing also the immense power of the press over the minds of the people, the Pacha has also established a newspaper, the first of the kind ever seen in the Turkish empire. Of course this paper will speak only what the Pacha pleases; but still it is an immense step in civilisation to have recourse to a moral power of persuasion, instead of the whip, the

bludgeon, and the sword, the usual instruments of rule in all the Turkish provinces. Even the Grand Sultan himself has seen the use which may be made of the press, and a newspaper now appears in Constantinople itself.

The Pacha has made an approach to what we may even call the liberal in politics. He has selected leading men of the various provinces of Egypt, and brought them together to form a deliberative council or parliament at Grand Cairo. No doubt Parliament men, who have the fear of the scimitar and bowstring before their eyes, will be careful to meddle with nothing but what is propounded to them, and will be guarded in the language which they employ; but still such a council may be of eminent service both to the Pacha and to the people. The evils of bad government more frequently result from ignorance than criminal intention, and even a Pacha may prefer beneficial measures when he has no strong passion to gratify by an opposite course. Such a council, therefore, to supply a Pacha with information of what is to his advantage, may be a considerable blessing.

With the formidable strength of land and sea forces possessed by the Pacha, it was not to be expected that he should not endeavour to enjoy the recreation of monarchs—the game of war. His troops proceeded up the valley of the Nile, far beyond the acknowledged boundaries of Egypt; and the Nubians, after a sanguinary but useless resistance, submitted to his power. His forces crossed the desert, and the inhabitants of the Oases yielded obedience and tribute. He extended his authority along the shores of the Mediterranean to the west of Egypt, into the now thinly peopled territories of Lybia and Cyrene. But a far mightier and more glorious war brought renown to his standards. The fanatical sect of the Wahabees in Arabia, under the name of reform, had overcome the faithful, and at last taken possession of the holy cities of Mecca and Medina, and, putting a stop to the pilgrimages, had rendered it physically impossible to observe the most meritorious of all the precepts of the Koran. The Sultan of Constantinople, as head of the faithful, was bound to re-open the way to the tomb and birth-place of the Prophet, and for this purpose he called on the Pacha of Egypt to send his forces to the war. After two campaigns, the most complete success was obtained, the armies of the Wahabees were defeated, and the broken remnants were driven off to the deserts.

For many years political writers have said, why does the great chief of Egypt yield submission to the Sultan of Constantinople and pay him tribute, and waste his treasures and his troops in wars in which he is not himself the party chiefly interested? Such writers have forgot that there is more appearance than reality in the power of the Turkish Pachas. Every one of them appears as a king in his own province, though none so completely so as the Pacha of Egypt has become. They have forgot the fanatical attachment of all the Turks to their Pope and chief, the Sultan of Constantinople; and Mahomet Ali, of Egypt, was so well aware of the extreme hazard of a contest, from the probable desertion of his followers, that necessity only could drive him to the attempt.

Hence, in the case of the war carried on by the Turks to subdue the Greeks, the Pacha of Egypt, on being so commanded, sent his land army to attack the Morea, and his fleet, uniting with the Turkish navy, shared with them in the disastrous defeat at Navarino. After that event, and the arrival of the French troops, the Egyptian army readily yielded to superior power, and, without leave of the Sultan of the Turks, returned to their country. From that time the Pacha of Egypt employed himself in re-establishing his army on its complete war footing, and equipping his marine, and in the two years' war of the Turks and Russians, he excused himself from sending treasures or troops to maintain the standard of the faithful. The Pacha of Egypt probably saw that the time was at last come when he could no longer remain on friendly terms with his chief; and his only chance of safety and honour lay in boldly entering on war, and leading his armies to attempt to conquer the territories of the neighbouring Pachas. Accordingly, he sent his troops across the desert that lies between Egypt and Palestine, and his navy putting to sea, co-operated in the war.

Ali Pacha is now a man in the decline of life, but of stout constitution, and is said to be easy and familiar in his habits. Though despising the Turkish character in some of its points, he is still addicted to all the indulgences of Mahomedanism. In his appearance, he is venerable, from a long flowing white beard, and is remarkable for the keen quickness of his eyes. Should he have the bravery and good fortune to secure Palestine as one of his possessions, he will assuredly be considered one of the most interesting personages in modern history.

CAPITAL PUNISHMENT IN SWEDEN.

Flagrant crimes (says Rae Wilson, in his *Travels in Normandy*, &c.) rarely occur in Sweden, and not a single execution, I was told, had taken place in Gottenburg for twenty-four years. An affair, however, attended with circumstances of marked atrocity, took place just before I arrived, that excited a more than ordinary degree of interest. The history of it is shortly this: A Danish vessel was boarded and plundered by some rufians, who had long been notorious for their bad conduct, and, in truth, held to be a pest

to that part of the coast where they lived. At this time their acts of outrage and violence exceeded those of any previous period. In addition to their committing robbery, they attacked and boarded a vessel, which they not only plundered, but barbarously murdered two men and a boy, who formed the crew. On the crime being discovered, the whole country turned out to hunt up the authors of these bloody deeds, and completely encircled the spot to which they had fled for refuge. On being discovered, they were apprehended and taken to Gottenburg, and brought to trial before a court of assize. It is laid down as a fundamental law in the criminal code of this country, that in cases of murder no proof of a circumstantial nature is admitted as sufficient for inflicting capital punishment; and, of course, hearsay must be of still less authority. This can only proceed on two grounds; namely, the full confession of the criminal himself, or a positive evidence of the crime having been actually seen committed. Should this not happen, he is confined to jail; where it often occurs that the horrors of a guilty conscience prompt him to confess his crime, and thus satisfy the ends of public justice. The ring-leader here first admitted the full extent of his guilt, and showed the greatest mark of contrition. The other two confessed their criminality at the distance of three months afterwards, and all were led out for execution. The mode of punishment was as follows:—Their right hands were first cut off, and immediately afterwards their heads; when their bodies, with the clothes, were stretched out horizontally on three different wheels, attached each to the top of a pole about ten feet in height. The heads and hands were nailed on separate poles of similar height, and the whole left exposed, till they dropped from the effects of the elements.

SPANISH LITERATURE.

The literature of Spain is well known to be in the lowest condition, and in a state most prejudicial to the cultivation of genius, or the intelligence of the people. This particularly appears to be the case from an account written by Henry D. Inglis, in his work entitled "Spain in 1830." "A priest, with whom I was acquainted in Madrid (says he), telling me one day that he had thought of going to London or Paris to print an English and Spanish Grammar which he had written, I asked him why he did not print them in Madrid, since they were intended for the use of his own countrymen, especially as they could contain nothing political? His answer was, that nothing was so difficult as to obtain a licence to publish a book, even although it contained no allusion to politics; and 'the better the book,' said he, 'the more difficult it is to obtain a licence, and the more dangerous to publish; because government does not wish to encourage writing, or even thinking, upon any subject; and the publication of a good book sets men a-thinking.' This comprehensive reply explains pretty nearly the present state of literature in Spain, judging of it by the number and merit of published works.

The number of books published from 1820 to 1823 was very considerable. The energy then communicated to letters, from the removal of all restriction, was extraordinary; books upon all subjects issued from the press, and the best proof perhaps that can be given that many of these were books of talent, is, that most of them are now prohibited. Literature, however, then received an impetus, which still continues in some degree to affect it, notwithstanding the difficulties to be overcome; for there is a considerably greater number of books published now than previous to the revolution: and no reasonable doubt can be entertained that another removal of the restrictions which press upon literature would bring into the field a large accession of native talent. Even after a licence has been obtained to publish a manuscript, its publication is still a dangerous speculation; because it frequently happens, that, when the book is printed and partly circulated, some great man, even more fastidious than the censors, discovers a dubious passage, and the book is prohibited. There are four difficulties, therefore, which an author must resolve to face before he sits down to prepare his manuscript:—The probability that he may be refused a licence; the probability that, before being licensed, his manuscript may be mutilated—a probability that, I am told, amounts almost to a certainty, unless the work be upon one of the exact sciences; the probability that, after the work be published, some caprice may forbid its sale; and the certainty that, if the work be a talented work, the author of it, whether obtaining his licence or no, will be looked upon with suspicion; and if in government employment, will almost certainly lose his appointment. These are sad drawbacks upon literary exertion; but there is yet another. Men are afraid to read as well as to write; and the sale of the work is therefore insecure. Booksellers do not care to venture upon the publication without some guarantee; the consequence of which is, that almost every book published in Spain is published by subscription or in numbers, or both in numbers and by subscription—by either of which modes the risk is lessened. What should we say in England of bills posted about the streets, announcing a new novel, to be published by subscription and in numbers? Yet I saw an announcement of this kind, of a novel to be called 'El Dissemulador'—the Dissembler. But the greater number of books at present published in Spain are

translations from French and English, adapted, of course, to the Spanish censorship.

Although the Spanish government endeavours by every means to repress intelligence, and thwart the progress of knowledge, there is no lack of books in Spain to those who will and dare to read them. This is indeed done under the rose; but it is done. There are two libraries in Madrid, which contain the best French authors; and persons who are known to the librarian, or recommended to him, may obtain almost every prohibited book. I had personal proof of this. Sitting one morning with a lady connected with the royalist party, but a woman of very liberal views, and one of the few blue-stockings of Madrid, I was compassionating the situation of those who, like herself, were lovers of literature, but who were denied the means of gratifying their taste. The lady assured me she had no need of my compassion upon this score, for that she might have any French author she chose, and many English authors, from the library of —. And when I expressed some surprise at this, she desired me to fix upon any celebrated books that occurred to me, and they should be put into my hands in less than half an hour. I chose accordingly; and in ten minutes I had in my hands a Paris edition of the 'Social Compact,' and the Basil edition of 'Gibbon's Historical Work.' Books, therefore, may be had; but persons are afraid to have and to read them. We may ask, can these restrictions and fears exist much longer? I think not. The reign of ignorance in Spain, it is evident, already gives symptoms of its dissolution."

WILL BLOCK, A TRUE TALE.

It was on the afternoon of a lovely day in summer, a veteran tar came whistling through the narrow lane that cuts off a considerable portion of the main road between Plymouth and Exeter, and shortens the journey to the weary traveller. There was something in his whole appearance so peculiarly interesting and neat, that the passenger, after receiving his "What cheer, what cheer?" could not refrain from turning round and stopping to take another look. Indeed, that sparkling eye of good-humoured pleasantry, that countenance displaying at once the generous benevolence of his heart, was not easily passed by unnoticed, or readily forgotten. His dress consisted of a blue jacket and white trousers; a straw hat bound with black riband thrown carelessly back upon his head, so as to display the straggling locks of silvered grey that flowed beneath, and a black silk handkerchief, loosely knotted round his neck, over which lay the white collar of his shirt; a short cudgel was tucked under his arm. He had now reached the inn by the wayside, where he purposed heaving to, to hoist in a fresh supply of grog and biscuit for the voyage. Crossing the threshold, and entering the passage, his ears were saluted with vile discordant sounds of some one in a terrible passion. "Never throw hot water and ashes to windward," says the old tar, shortening sail; "I'd sooner engage a squadron of fire-ships than one woman in a rage. They're sure to have the last broadside, even while sinking." He was putting about to stand off again, when a sweet voice, in plaintive supplication, struck upon his heart, and brought him up. 'Twas in reply to the vociferations of the termagant, and he remained backing and filling in the passage. "What! money, clothes, all lost! did you say?" exclaimed a rough-strained throat, something resembling the combined noise of a blacksmith's bellows and a flint-mill; "all gone, eh?" "Yes, ma'am, all—all is lost to me," replied a female, in tones which would have excited pity in any heart that claimed the smallest acquaintance with humanity. "So you think that story will do, eh?" continued the first; "'twon't though, missus, so you must tramp. I don't keep a house for vagrants, and such like." "Indeed, indeed, 'tis true; the villains robbed me of all, and I've walked many, many weary miles. Oh but for a piece of bread!—a little cold water!—can you deny me this? Indeed, I've not been used to beg!" "Why, that's the way with all you canting creatures—all ladies, forsooth! Where do you come from?" "Oh, ma'am, I'm a wretched girl, yet I was once happy; sorrow has indeed reached me—lost, lost Lucy!" "Ha, I see how it is! Get out of my house—get out, I say! What! you won't, eh? Here, John! Bet! where are you all? you pack of idle vagabonds! Here, take this miss, and turn her out." "Oh, let me implore your pity—here humbly let me beg—" This was too much for our honest tar. Entering the kitchen, he beheld a young girl, plainly but neatly dressed, on her knees before an old woman. The tears were running down her pale face, and she seemed fainting with fatigue and grief, while a man grasped one shoulder, a boy the other, and a maid-servant together, were attempting to force her out. "Yo-hoy, what's the matter here?" said the veteran, flinging the man to the opposite side of the room, and giving the boy a trip that laid him sprawling on the other. "Cowardly, lubberly rascals! what, grapple a vessel in distress? And you (turning to the landlady) to stand looking on! Is this a Christian country? For shame, old woman!" "Old woman, forsooth!" exclaimed the now doubly exasperated landlady. "What, you takes the part of the young-un, eh? But she shall budge directly." "I say she shan't, then. Come here, pretty one, and nobody shall harm you

while old Will Block can keep the weather-gage." "Well, this is fine treatment, too, in my own house! And you, ye rascallions, lay hold of her, I say." "Touch her if you dare," says old Will, flourishing his stick, "and I'll—I'll—Ay, that's right, keep off, for if you come athwart my hawse, blow my wig but I'll cut your cables!" Poor Lucy had got close to his side; but, fearing her protector would be injured for his generosity, she entreated him to desist. "I am not worthy your notice, sir; only a drop of water, for I am very faint." "Shall have the best the house affords, while I've a shot in the locker. Go along, old Mother Squeezemon, and get something for the poor child; don't you see she's all becalmed?" "What, give my property to vagrants—not I, indeed! Will you pay the reckoning?" "Avast, old Grampus! think of this here when you stands at another bar, and the last great reckoning comes—how will you look then? This will stand a black account against you, and what'll you have to rub it off with, eh? Go, get her a glass of wine." "And who's to pay? Wine, indeed!—get her some water, Jack," said the now alarmed landlady, for Will's reflection, and the solemn manner in which it was uttered, operated powerfully on her conscience. "Heave to, you porpoise-faced swab—none of your water; get us some wine, and the best in the house, too, d'ye hear! Why, what's the lubber grinning at? Will this satisfy you, ye old she-shark?" thrusting his hand into his jacket pocket, and drawing it out again filled with gold; "will this satisfy you?" The landlady's countenance brightened up: "Why if so be as how you means to pay for it, that's another thing. Well, well, I dare say you're a gentleman, after all. Come, child (to Lucy), I'm sorry I was so harsh, but it's only my way. There, run, John, and fetch a bottle of my best wine, and some of those nice sweet cakes—Stop, John, stop, I'll go myself for the poor dear." "Ha, ha, ha! what a generous heart!" cried Will; "how readily it expands at the voice of distress!" shaking his pockets. "Here's the key will unlock the floodgates of her benevolence at any time (holding up a guinea). But come, pretty one," drawing a chair, "sit down and rest." "Oh, sir, how shall I ever repay your bounty?" said Lucy. "Wait till I ax you," replied Will, who felt hurt at the idea of being repaid. "Here, miss," said the landlady, entering, "take this nice cake and wine, 'twill do you good. Bless your sweet face! why, do you think I would go for to hurt a hair of your head?" "There, there, there's enough of it—no more palaver; I am't agreed for that, you know, though I suppose you'll consider it in the bill." Luckily at this moment, to prevent the gathering storm, the bell rung violently in another room, and she disappeared. "Come, come, don't be backward; never mind an old sailor," said Will; "refresh yourself, and then tell me what I can do to serve you; speak as if I was your father." "Oh, sir, don't talk of my father—I have fixed a wound in his heart!" "There, there; don't cry: I can't bear to see a woman's tears; it makes a fool of me: but tell me honestly all about it, for I've got to be at old Admiral M——'s by night." "Of—Grove?" inquired Lucy, much agitated. "Why, ay; do you know him?" "No, sir, but—but I have seen—I have been in company with his nephew;" and again she burst into tears as if her heart would break. "Why, ay, I see how it is: this is some of Mr Tommy's doings, eh? Zounds!" clenching his fist; "but no matter. And where are you come from?" "From my father's, sir." "And who is your father?" "Oh, do not ask me!—my name is Lucy B——." "What, the daughter of old B——, that was in the Venerable as first lieutenant?" "Yes, I am indeed his wretched daughter." "Zounds! why," starting up in a passion, "why, and has Tom dared?—But don't be frightened, don't be frightened. And so you have deserted your home and my poor old friend?" "Spare me, sir! spare me! If my father was indeed your friend, oh, succour his erring child!" "Well, well, my upper works get crazy now—hardly able to weather the storm. But the villain that would betray innocence, and then abandon his victim—zounds! But come, come along." "I thought of going to the admiral's, sir." "To be sure, to be sure! we'll be under weigh in a minute." "Yet, sir, perhaps he will not see me, or it may be injurious to his interests; and oh, I would willingly die to serve him, for he has a feeling heart." "A what?—a feeling heart! Why are you here then? But come along, sweetheart!" and, discharging the reckoning, they set off in company.

Of all the eccentric beings in this eccentric world, old Admiral M—— was the most eccentric. He had risen solely by merit from the station of cabin-boy to vice-admiral of the white; and 'twas ever his boast that he had never skulk'd in great men's pockets, nor been afraid to dip his hands in a tar-bucket. "I came in at the hawse-holes," he would say, "and didn't creep in at the cabin-windows." He had been known to absent himself from home for weeks together; and no one could tell where he went, or what had become of him, till his repeated acts of generous bounty discovered the track he had taken. He would frequently return home without previous notice, enter the house unobserved, ring his bell, and order refreshments, as if he had never quitted it. Not an old sailor that ever sailed with him but was welcome to partake of his cheer; and those who had been his messmates previous to his mounting the uniform (if of good character, but not so successful as himself)

always sat at his own table. Possessed of an immense fortune, which he was accustomed to say was drawn from the Spanish *stocks*—yet without children, for he was a bachelor, he had adopted his nephew, determined to leave him the bulk of his property. The young man, who really was naturally of an amiable disposition, on this accession to his uncle's favour, associated with some of the dashing characters of the day, and became tinctured with their vices and follies. He had been introduced to the family of Lieutenant B—— by a brother officer; and that acquaintance, which terminated so sadly for poor Lucy, was begun. Yet he passionately loved her; but fearing the condemnation of the admiral, and the loss of his patronage, he had withdrawn himself from Exeter without even bidding her farewell, choosing rather to immerse himself from the world than break the oath he had pledged to Lucy, or disoblige his uncle by marrying without his consent, knowing that the old gentleman was ambitious for his nephew to look for a wife agreeably to the high prospects in view before him, and equally convinced that to thwart his inclinations would but annihilate all his hopes, and cast him adrift upon the world. Such was the state of affairs when Lucy left her home to endeavour to gain an interview with her lover, and fell in with old Will, who in early life, according to his own account, had sailed with the admiral, and was now going to pay him a visit, and see some of his old messmates, of whom the principal part of the household was composed. She had been plundered by some villains of all she possessed at daybreak, but still continued her journey, till, worn with hunger, and faint with fatigue, she entered the inn, and implored assistance.

The shades of evening fell on the landscape as they passed under the avenue of trees that led to Grove House. Will, having promised to exert himself in obtaining an interview between Mr M—— and his convoy, left her at a short distance, and proceeded onward. Almost overpowered by her reflections, and every pulse throbbing violently with agitation, she leaned against the trunk of a tree, expecting to see the being whom, next to heaven, she loved most tenderly. 'Twas now too dark to distinguish objects, but she could hear footsteps approaching, and she sunk without sense or motion to the ground. On recovery, she found herself sitting on a couch in a small room, and the old housekeeper, with other females, sedulously administering to her necessity. Her eye glanced wildly round for another object, while the old lady strove to soothe her mind, informing her that 'twas herself who had discovered her in the avenue, at the request of old Will. Refreshments were placed, of which Lucy partook sparingly, desirous of knowing, yet trembling to ask, whether Mr M—— was in the house, or had seen the worthy veteran, her kind conductor.

"Pray, sir," said the admiral, entering the room abruptly when his nephew was sitting alone, and ruminating upon his own hapless condition, but more upon the object of his sincere attachment, little imagining that she who occupied his thoughts was at that moment under the same roof—"pray, sir, what does that man deserve who robs a friend of his dearest treasure—who, stealing into the confidence of a young and artless girl, under the flag of affection, turns pirate, and plunders his prize with remorseless cruelty?" The young man sat petrified, for these questions were precisely accordant to his own feelings previous to the entrance of his uncle. "Answer me!" exclaimed the admiral, raising his voice, "answer me directly!" "I cannot, sir; I am too deeply sensible of error." "Or what does he merit," continued the admiral, "who, contrary to the views of a relative that has raised him to opulence, first contracted himself to a young female, and then deserted her?" "Infamy!—infamy and disgrace!" exclaimed the agonised M——. "I feel it all—all, and shudder!" "You have judged right, sir. Your acquaintance with the poor distressed child of Lieutenant B—— I have just received information of, and your own lips have condemned you." "Not so much as my heart, sir," replied M——. "Pass what sentence you please; but oh! suffer me to expiate my fault!—do not drive me to desperation!" "Tis well, sir, you are convinced of your error;" and, ringing the bell violently, a servant appeared. "Order Mr M——'s horse to the door;" then turning to the young man, "this is no longer a home for you; however, you shall first have the satisfaction of facing your accuser;" and again ringing the bell, directed another servant to introduce the stranger. No culprit ever stood more agitated than M—— while these orders were given. He fixed his eyes upon the door in anxious expectation; but what were his feelings—what his agony—when Lucy herself appeared! He would have rushed towards her; but his uncle caught his arm, and, in a voice that made the poor girl tremble, "No, sir! would you again coil like a snake about your victim? would you once more sting a bosom whose only fault was loving a villain? Go, sir! you have forfeited all pretensions to my favour—you have degraded my name—you have disgraced yourself. Go, and let me never see your face again!" This was too much for poor Lucy; she had expected a private interview with her lover, and imagined, when she quitted the housekeeper's apartment, 'twas for that purpose the folding-doors of the drawing-room were thrown open. How great, then, was her surprise and distress when she found herself in the presence of the admiral! He

was habited in an immense cloak, that covered his whole person, and his laced cocked hat upon his head; but the sentence was no sooner pronounced than Lucy knelt before him, imploring mercy. M—, at the same moment, threw himself by her side, caught her upraised hand, joined it in his own, and offered his petitions with hers. The old admiral dashed the tears from his eyes, and, overcome by the scene, grasped their united hands, and blessed them. But who can express the astonishment, the gratitude, of Lucy, when, throwing off his cloak and hat, he appeared before her as her generous benefactor, protector, and guide—even old WILL BLOCK!—*Greenwich Hospital.*

THE SCOTTISH DUKES.

HAMILTON.

GREAT as this family has been in the recent periods of Scottish history, it is not very ancient. It possessed no distinction before the reign of James II., and cannot well trace its existence any higher than the time of Bruce. In the space of time between the reigns of these two monarchs, *Hamilton of Cadyow* was only a knight of small estate. Sir James Hamilton, the seventh of the series, was man of eminent political ability, and in 1445 became a lord of Parliament, under the title of Lord Hamilton. His principal lands were those of Cadyow and Mawhan, in Lanarkshire, and Kinnell in West Lothian. In the earlier part of his career, he joined the turbulent Earl of Douglas, but at last he left that nobleman at a most critical moment, and gave the superiority to the royal forces. Rising upon the ruins of his former friends, he married the Princess Mary, daughter of James II., and widow of Thomas Boyd, Earl of Arran. This great nobleman died in 1479. His son James, second Lord Hamilton, was created Earl of Arran by James IV. immediately after the marriage of that monarch to the princess Margaret of England in 1503. The Earl of Arran bore a conspicuous part in the transactions of history during the minority of James V. His son, the second earl, as great-grandson to James II., would have succeeded James V. as king, but for the birth of the unfortunate Mary, a few days before the death of that monarch. As some consolation for this disappointment, he was made regent of the kingdom, an office for which his vacillating character was ill fitted. Having favoured the views of France in bringing about a match between Mary and the Dauphin, he was honoured with the French title of Duke of Chastellerault, which, however, has since fallen into abeyance. The eldest son of this nobleman was insane, and the family influence and vassalage were managed, during his life, by his brothers Lord John and Lord Claud, the latter of whom was ancestor of the Abercorn family. These nobleman acted and suffered much for Queen Mary, who, when about to submit to the executioner, took a ring off her finger, and sent it to Lord John, as a memorial of her gratitude. After suffering years of exile on her account, he was restored by James VI., and, his insane brother being put aside, was created Marquis of Hamilton, April 17, 1599. He died in 1604. His son James, the second marquis, was a favourite courtier of James VI. during his English reign, but died young, March 2, 1625, a few days before the king. James, the third marquis, son of the preceding, was a remarkably amiable nobleman, and for many years was chief adviser to Charles I. on Scottish affairs. In the unfortunate disputes between his countrymen and their sovereign respecting religion, he took a conspicuous part as a mediator, but entirely failed in all his efforts to preserve peace. He consented to serve his master as commander of the fleet sent in May 1638 to overawe the Covenanters. But he never dared to land. It is said that when his ships appeared off Leith, his mother rode down to the shore amidst the people, with pistols at her saddle-bow, and threatened to shoot him with her own hand if he should dare to set a hostile foot upon his native country. He never put this threat to the proof, but in a few weeks sailed back to England. In the heat of the civil war, he and his brother, the Earl of Lanark, became so obnoxious to the royal suspicions, on account of their mediation, that the king imprisoned them in Pendennis Castle. Previously, however, in 1643, he was created Duke of Hamilton. Having been afterwards released, he endeavoured, in 1648, to rescue his unfortunate master by means of a Scottish army called the *Engagement*, but was defeated by Cromwell, and taken prisoner. When Charles passed through Windsor to his trial, the captive marquis was permitted to approach. He fell at the feet of his royal kinsman, and could only murmur forth, "My dear master!" "Yes," said Charles, punning, in bitterness of spirit, upon the words, "I have indeed been a dear master to you." He was beheaded in Palace Yard, Westminster, a few weeks after the death of the king. His brother, who succeeded to his honours, fell at the battle of Worcester, little more than two years after; and the titles and estates then devolved on Anne, daughter of the first duke. This peeress is said to have been supported during the usurpation chiefly by the exertions of a female servant. She married a son of the Marquis of Douglas, who, after the Restoration, was created Duke of Hamilton for life. Thus the family name ceased, in reality, to be Hamilton, and became Douglas. This peer acted a conspicuous part at the

Revolution, by presiding over the Parliament which settled the crown on William and Mary. He died in 1694, and, in 1698, upon the resignation of the duchess (who survived till 1717), the titles were transferred by royal patent to their son James, who had all along been a violent Jacobite. This nobleman acted a prominent part in the politics of Queen Anne's reign, as leader of the country interest, but, in November 1712, was cut off in the famous duel with Lord Mohun, in Hyde Park. On this occasion Lord Mohun was also killed. Owing to the false evidence of the duke's second, Colonel Hamilton, General Macartney, who had acted in that capacity to Lord Mohun, was accused of having killed his grace, of which, however, he was honourably acquitted upon trial. It affords a curious instance of the difficulty of ever altogether wiping off a false imputation, that, in common fame at this day, the Duke of Hamilton is supposed not to have got fair play. This nobleman, who had been created Duke of Brandon as a British peerage, was succeeded by his son James, fifth duke, who in his turn gave place to James, sixth duke, the grandfather of Douglas, the eighth duke, who was succeeded by his uncle, Archibald, father of the present noble inheritor of the titles. The family has not, ever since the reign of Queen Anne, made a great figure in public events, having been, during one part of the intermediate time, Jacobites, and in the remaining part Whigs, and thus, in a great measure, debarred from high official employment. The present duke is a Whig; and the family possessions, which, rather curiously, are just about the same in extent as in the reign of James II., may be estimated at about £50,000 a-year.

BIOGRAPHIC SKETCHES.

EDWARD DANIEL CLARKE.

EDWARD DANIEL CLARKE, the object of the following interesting biographic sketch, and one of the most distinguished travellers in recent times, was born on the 5th of June 1769, at Willington, in the county of Sussex. "Even when a child," says his biographer, in the work entitled the *National Library*, "he is said to have displayed great narrative powers, which he exercised as frequently as possible for the amusement of his father's domestics and parishioners. In his boyish studies, however, he was wanting in application, a fault arising from the quickness and vivacity of his mind, actuated by insatiable curiosity, and characterised from the beginning by a decided partiality for natural history. In the spring of 1786, he obtained the office of chapel clerk at Jesus College, Cambridge, and next year he sustained the loss of his father, when he had to contend with numerous difficulties. He seems to have been disgusted with the system of education at Cambridge, caring nothing for mathematics, which were there regarded all in all, and finding nothing whatever to kindle the ardour of his ambitious mind. His favourite studies, such as they were, he nevertheless pursued with considerable eagerness; and by degrees his taste, after wavering for some time, settled definitively on literature.

In the year 1790, Clarke obtained the office of private tutor to the Hon. Henry Tufton, nephew to the Duke of Dorset; and in 1794, he was fortunate enough to obtain an engagement to travel with Lord Berwick, through Germany and Switzerland into Italy. He was now in the position for which nature had originally designed him. "An unbounded love of travel," says he, "influenced me at a very early period of my life. It was conceived in infancy, and I shall carry it with me to the grave." Clarke and his companion having passed the Alps, which, however frequently seen, still maintain their rank among the most sublime objects in nature, descended into Italy, visited Turin and Rome, and then proceeded to Naples, in which city and its environs they remained nearly two years.

In the summer of 1793, there was, as is well known, an eruption of Mount Vesuvius, which our traveller, now an inhabitant of Naples, enjoyed ample opportunities of visiting. And here a striking manifestation of the daring intrepidity of the English occurred: for not only Clarke himself, part of whose business as a traveller it was to familiarise himself with danger, but numbers of other English gentlemen, and even ladies, ascended to the mouth of the burning crater, and the sources of lava streams in an active state, for mere amusement; where on one occasion a lady narrowly escaped death from a large stone from the volcano, which flew by her like a wheel. At another time, the whole party were menaced with the fate of the elder Pliny. It was in the month of February. "I found the crater in a very active state," says Clarke, "throwing out volleys of immense stones, transparent with vitrification, and such showers of ashes involved in thick sulphurous clouds, as rendered any approach to it extremely dangerous. We ascended as near as possible, and then crossing over to the lava, attempted to coast it up to its source. This we soon found was impossible, for an unfortunate wind blew all the smoke of the lava hot upon us, attended at the same time with such a thick mist of minute ashes from the crater, and such fumes of sulphur, that we were in danger of being suffocated. In this perplexity I had recourse to an expedient recommended by Sir W. Hamilton, and proposed immediately crossing the current of liquid lava, to gain the windward side of it; but felt some fears, owing to the very liquid appearance the lava there had so near its source.

All my companions were against the scheme, and while we stood deliberating, immense fragments of stone, and huge volcanic bombs, that had been cast out by the crater, but which the smoke had prevented us from observing, fell thick about us, and rolled by with a velocity that would have crushed any of us, had we been in the way. I found we must either leave our present spot, or expect instant death; therefore, covering my face with my hat, I rushed upon the lava and crossed over safely to the other side, having my boots only a little burnt, and my hands scorched. Not one of my companions, however, would stir, nor could any persuasion of mine avail in getting a single guide over to me. I then saw clearly the whole of the scene, and expected my friends would every moment be sacrificed to their own imprudence and want of courage, as the stones from the crater fell continually around them, and vast rocks of lava bounded by them with great force. At last I had the satisfaction of seeing them retire, leaving me entirely alone. I begged hard for a torch to be thrown over to me, that I might not be lost when the night came on. It was then that André, one of the ciceroni of Resina, after being promised a bribe, ran over to me, and brought with him a bottle of wine and a torch. We had coasted the lava, ascending for some time, when, looking back, I perceived my companions endeavouring to cross the lava lower down, where the stream was narrower. In doing this, they found themselves insulated as it were, and surrounded by two different rivers of liquid fire. They immediately pressed forward, being terribly scorched by both currents, and ran to the side where I was; in doing which, one of the guides fell into the middle of the red-hot lava, but met with no other injury than having his hands and face burnt, and losing, at the same time, a bottle of vin-de-grave, which was broken in the fall, and which proved a very unpleasant loss to us, being ready to faint with excessive thirst, fatigue, and heat. Having once more rallied my forces, I proceeded on, and in about half an hour I gained the chasm through which the lava had opened itself a passage out of the mountain."

In the July of the same year, our traveller viewed Vesuvius under another aspect, when soft, tranquil beauty had succeeded to terrific sublimity. "While we were at tea in the Albergo Reale," says he, "such a scene presented itself, as every one agreed was beyond anything of that kind they had ever seen before. It was caused by the moon, which suddenly rose behind the convent on Vesuvius; at first a small bright line, silencing all the clouds, and then a full orb, which threw a blaze of light across the sea, through which the vessels passed and repassed in a most beautiful manner. At the same time, the lava, of a different hue, spread its warm tint upon all the objects near it, and threw a red line across the bay, directly parallel to the reflection of the moon's rays. It was one of those scenes which one dwells upon with regret, because one feels the impossibility of retaining the impression it affords."

In the autumn of 1793, Clarke received from Lord Berwick a proposal that he should accompany him to Egypt and the Holy Land, with which our traveller, whose secret wishes had long pointed that way, immediately closed. While preparations were making for the journey, Lord Berwick suddenly recollected that some living, to which he was to present his brother, might fall vacant during his absence, and be lost to his family. He determined, therefore, on sending an express to England; and when he had hired his courier, Clarke, who perhaps felt the want of violent exercise, offered to accompany the man, that no time might be lost. He accordingly set out for England, and, having remained two or three days in London to execute the commission with which he had been entrusted, he hurried down to Shropshire, and arranged the business which had brought him to England. This being accomplished, he returned to London, where, to his infinite surprise and mortification, he found a letter from Lord Berwick, informing him that the expedition to Egypt had been postponed or abandoned. His engagement with this nobleman, however, had not yet expired. He, therefore, after a short stay in England, hastened back to Italy, from whence he finally returned in the summer of 1791.

Clarke now spent some time with his mother and family at Uckfield, and, in the autumn of the same year, undertook, at the recommendation of the Bishop of St Asaph, the care of Sir Thomas Mostyn, a youth of about seventeen. This engagement continued about a year, during which period he resided with his pupil in Wales, where he became known to Pennant, with whom he afterwards maintained a correspondence. When this connection had, from some unexplained causes, ceased to exist, our traveller undertook a small periodical work, called "*Le Rêveur*," which, when twenty-nine numbers had been published without success, was judiciously discontinued, and sunk so completely into oblivion, that not a single copy, it is believed, could now be found.

In the autumn of 1796, Clarke entered into an engagement with the family of Lord Uxbridge, which, under whatever auspices begun, was highly beneficial to himself, and satisfactory to his employers. The youth first placed under his care, delicate and feeble in constitution, soon fell a prey to disease; but the next youngest son of the family, the Hon. Berkeley Paget, succeeded his brother; and with him, in the summer and autumn of 1797, our traveller made the tour of Scotland. This was in every respect an

agreeable and fortunate journey for our traveller, who not only enjoyed the scenery, wild, varied, and beautiful, which the north of England and many parts of Scotland afford, but secured in his pupil a powerful friend, who, so long as our traveller lived, promoted his interests, and when his life had closed, continued the same benevolent regard to his family.

On the termination of his connection with Mr Paget, who was now sent to Oxford, Clarke retired to Uckfield, where for a time he seemed entirely immersed in the pleasures of field-sports. His devotion to this species of amusement, however, was destined to be of short duration. A young gentleman of Sussex, whose education had been very much neglected, succeeded about this time to a considerable estate, upon which he intimated his desire of placing himself for three years under the guidance and instruction of our traveller, first at Cambridge, and afterwards during a long and extensive tour upon the Continent. The pecuniary part of the proposal was very liberal, says Mr Otter, and the plan was entered upon without delay. The traveller and his pupil remained a whole year at Cambridge, during which the former, who fully understood the advantages of knowledge, and had been hitherto prevented by his wandering life from pursuing any regular course of study, profited quite as much as the latter.

The preliminary portion of their studies being over, Clarke and his pupil began to prepare for their travels. Two other individuals were at first associated with them—Professor Malthus, author of the celebrated treatise on population; and the Rev. Mr Otter, afterwards the biographer of our traveller. The party set out from Cambridge on the 20th of May 1799, and arrived at Hamburg on the 25th. Here they made but a short stay before they set out for Copenhagen, and from thence, by way of Stockholm, across the whole of Sweden to Tornea, on the Gulf of Bohnia. Malthus and Otter left them at the Wener Lake. Clarke, with all the enthusiasm of a genuine traveller, could never imagine he had carried his researches sufficiently far; but, having reached the 66th degree of northern latitude, declared he would not return until he should have snuffed the polar air. His pupil, Cripps, seems to have shared largely in his locomotive propensity, and in the courage which prompts to indulge it. They therefore proceeded towards the polar regions together; but having reached Enontakis, in latitude 68 degrees 30 minutes 30 seconds north, our traveller, who and previously been seized by a severe fit of illness, was constrained to abandon the polar expedition, and shape his course towards the south. Writing from Enontakis to his mother, "We have found," says he, "the cottage of a priest in this remote corner of the world, and have been snug with him a few days. Yesterday I launched a balloon, eighteen feet in height, which I had made to attract the natives. You may guess their astonishment when they saw it rise from the earth.

Is it not famous to be here within the frigid zone, more than two degrees within the arctic, and nearer to the pole than the most northern shores of Iceland? For a long time darkness has been a stranger to us. The sun, as yet, passes not below the horizon, but he dips his crimson visage behind a mountain to the north. This mountain we ascended, and had the satisfaction to see him make his courtesy without setting. At midnight the priest of this place lights his pipe, during three weeks in the year, by means of a burning-glass, from the sun's rays."

Having, for the reason above stated, given up the design of visiting the polar regions, they returned to Tornea, and thence proceeded through Sweden and Norway, which latter country (probably for the same reason which made Pope of the opinion of the last author he read) he preferred for sublimity of scenery to Switzerland. They then entered Russia, and arrived at Petersburg on the 26th of January 1800. Clarke, it is well known, entertained a very mean opinion of the Russians; but, judging from the testimony of Bishop Heber, a calmer and more dispassionate man, as well as from that of many other travellers, it would appear that his judgment was neither rash nor ill-founded. "We have been here five days," says he. "Our servants were taken from us at the frontiers, and much difficulty had we with the Russian thieves as we came along. Long accustomed to Swedish honesty, it is difficult for us to assume all at once a system of suspicion and caution: the consequence of this is that they remove all the moveables out of their way. I wish much to like the Russians, but those who govern them will take care I never shall. This place, were it not for its magnificence, would be insufferable. We silently mourn when we remember Sweden. As for our harps, there are no trees to hang them upon; nevertheless, we sit down by the waters of Babylon, and weep. They open all the letters, and therefore there is something for them to chew upon. More I dare not add; perhaps your experience will supply the rest."

To this, if we add his picture of the execrable despot who then governed Russia, enough will have been said of his experience at Petersburg. "It is impossible," he writes, "to say what will be the end of things here, or whether the emperor is more of a madman, a fool, a knave, or a tyrant. If I were to relate the ravings, the follies, the villanies, the cruelties of that detestable beast, I should never reach the end of my letter. Certainly things cannot long go on as they do now. The other day the soldiers, by his order, cudgelled a gentleman in the streets, because the cock of his hat was not in a line with his nose. He has sent the Prince of Condé's army to the right about, which is hushed up, and it is to appear that they are ceded to Great Britain. He refuses passports even to ambassadors for their couriers. One is not safe a moment. It is not enough to act by rule, you must regulate your features to the whims of a police-officer. If you frown in the streets, you will be taken up."

From Petersburg they proceeded in sledges to Moscow, which, like most oriental cities, seemed all splendour from a distant view, but shrank upon their entering it into a miserable collection of hovels, interspersed with a few grotesque churches and tawdry palaces. This place,

which is too well known to require me to dwell much upon its appearance, they quitted to proceed to the Crimea. Arriving at Taganrog, on the sea of Azov, Clarke amused himself with swimming in the Don, the ancient Tanais, between Europe and Asia, and in thinking of the vast extent of country over which his good fortune had already carried him, and of the far more glorious scenes—Palestine—Egypt—Greece—which yet lay in his route. "Do, for God's sake, imagine," says he, in a letter to a friend, "what I must feel in the prospect of treading the plains of Troy! Tears of joy stream from my eyes while I write." To a person of such a frame of mind—and no others should ever leave their firesides—travelling, next to the performance of virtuous actions, affords the most exquisite pleasure upon earth. The imagination, impregnated by a classical education, with glowing ideas of what certain scenes once were, invests them with unearthly splendour, of which no experience can ever divest them.—*Concluded in next number.*

OLD ENGLISH CUSTOMS.

MANY years ago there appeared in the European Magazine a series of articles illustrative of the civil history, religion, laws, learning, arts, commerce, manners, customs, dresses, &c. of the people of Britain, both before and after the Norman conquest, and which being now little known, I consider worthy of being abridged and introduced to the notice of my readers. The authorities need not be quoted.

SLAVERY.

It is mentioned that the commerce of England was considerable even before the abdication of the Romans, and that it continued to flourish under their successors, the Saxons. During the supremacy of that people, the slave-trade of Britain rose into great importance. Great numbers of unhappy men, women, and children, were annually exported, and exposed to sale in all the markets of Europe; and it was the spectacle of so great a number of English slaves, exposed in this manner, in the market of Rome, that inspired Gregory the Great with the resolution of attempting their conversion to Christianity, and which he afterwards accomplished under St Augustine.

ENGLISH HORSES.

This noble breed of animals seems to be indigenous to this country, as even at this early period they were universally admired all over Europe for their shape and agility, and formed another valuable article of exportation.

ARTICLES IMPORTED.

Books, especially on religious subjects, as well as relics, pictures, statues, vessels, vestments, &c. formed no inconsiderable articles of importation; and when the city of Venice, and afterwards the cities of Pisa and Amalphi, became the repositories of the East, precious stones, gold, silver, linen, spices, drugs, and other kinds of goods, were likewise imported. What particularly increased this bold species of commerce was a law made by Athelstan, which enacts, "That if a mariner or merchant so prosper as to make three voyages over the high seas, with a ship and cargo of his own, he shall be advanced to the honour of a thane." Wines were likewise imported from Germany and Flanders, and furs, deer-skins, whale oil, ropes, &c. from Scandinavia. In short, it appears that the foreign trade of England was so extensive, even in this remote period, as to furnish such of her inhabitants as could afford to pay for them, with a share of all the commodities that were then known in any part of the world.

PRICES OF ARTICLES.

A sheep, by the laws of Athelstan, was estimated at one shilling, or fifteen pence of our money. The fleece was two-fifths of the value of the whole sheep, which is much above its present estimation. Silk and cotton were quite unknown. Linen was not much used. An ox was computed at six times the value of a sheep, and a cow at four. A horse was valued at about thirty Saxon shillings, which may be equal to thirty-six shillings of our money; a mare or colt was twenty shillings. A scouie one shilling and threepence. The board wages of a child the first year was eight shillings, or the price of a cow's pasture in summer, or an ox in winter. Between the years 900 and 1000, a hide of land was bought for 118 shillings, which was little more than one shilling an acre, and which appears to have been the usual price. The Saxon Chronicle tells, that, in the reign of Edward the Confessor, there was the most terrible famine ever known, insomuch that a quarter of wheat rose to sixty pence, or about fifteen shillings of our present money; consequently, it was as dear as if it now cost seven pounds ten shillings sterling. This much exceeds the great famine at the end of Queen Elizabeth's reign, when a quarter of wheat sold for four pounds.

CHARACTER OF THE SAXONS.

The Anglo-Saxons and Danes were described by all the ancient writers as remarkably tall, strong, and robust in their person; being distinguishable for the elegance of their shapes and the fairness of their complexions. They had considerable genius, and possessed a degree of courage equal to all northern natives, particularly the Danes, who made a considerable proportion of the first settlers, and who, coming from a barren uncultivated state, living mostly by plunder and piracy, were a remarkably hard and daring race. It was one of their favourite martial axioms, "That a Dane who wished to acquire the character of a brave man should always attack two enemies, stand firm and receive the attack of three; retire only one pace from four, and fly from no fewer than five." The Anglo-Saxons and Danes, when they were incorporated as a nation, were of a social disposition, and delighted much in forming themselves into fraternities, and guilds of various kinds, which were cemented by frequent convivial meetings. The social usages of this period introduced a general hospitality, which spread all over the country. Great excesses in eating and drinking were introduced by the Danes, who were always, and in some

respect continue till this day, lovers of the pleasures of the table. The profusion and indulgence of one Gormand, a Danish chief, was so excessive, that his name was applied to characterise persons of a luxurious living, and hence our phrase *gormandise*.

DEMEANOUR AND DRESS.

The Anglo-Saxons and Danes were at first rude and unpolished in their manners. The Welsh, or native British, were also so rude, that there was a necessity for making a law, "that none of the courtiers should give the queen a blow, or snatch any thing with violence out of her hand, under the penalty of forfeiting her majesty's protection." The dress of the Anglo-Saxons, on their arrival in this country, was, after the manner of their German ancestors, very simple, consisting of a large mantle or plaid, which covered the whole body, and was fastened on the right shoulder by a button or brooch; and those who could afford it wore under those mantles a kind of tunic, exactly fitted to the shape of their bodies, and ornamented with patches of the skins of different coloured animals. To these were appended breeches made of woollen or linen cloth, which hung below the knee like modern trousers. It is conjectured, with much feasibility, that the ordinary smock-shirt of the English peasantry in the present day is but a modification of the ancient tunic of these Anglo-Saxons, and is thus a very curious memorial. About their bodies, and above their tunics, they wore belts or girdles, in which their swords hung almost perpendicular. As they wore no stockings nor any kind of covering for the legs, for several centuries, they long retained their fondness for bathing in warm water, which was not only considered as one of the necessities of life, but enjoined by the church; and the deprivation of this was among the penances inflicted by the clergy on those guilty of transgressions. To bathe every Saturday was the constant practice of all who had any regard for personal propriety. About the year 785, they began to wear stockings, or bandages of woollen or linen cloth tied about the legs from the foot to the knee. These bandages are very visible on the figures in ancient tapestry. They were in the habit of wearing shoes before the use of stockings; but, what appears extraordinary, so late as the ninth and tenth centuries, wooden shoes were the only ones worn by the highest ranks of the people.

CANADIAN FORESTS.

The bush is the native title of the boundless forests of Canada. To the bush goes the settler hungered out of the old world, and there he finds food for his family. To the bush goes the lumberman, and there is a supply of timber for the Quebec market for ever and a day. To the bush goes the furrier, and there are his ciphers and beavers, the muffs and the tippets. In exploring the bush, a person faces at times the most fearful and terrible solitude: he bustles along, and the rustling he makes in getting through the brushwood deafens his ears to other sounds, while musquitos, &c. are too apt to obscure the functions of the eyes; but let him listen a little, and various singular sounds meet the ear, as do also strange prospects the eye. Birds fly about screaming busily, as if their nests had been lately robbed—these remind us of the lawns in England. None of the feathered tribe get into the woody wilderness perch upon boughs, and warble sweet notes. No linnets—no nightingales there: the music is melancholy, the cadence is sorrow, creating similar sensations in the wanderer. Partridges there sit on the branches, and there is the robin breast as large as a thrush, yet a much greater coward than the British robin: he turns tail on the proffered crumb, and fears to enter the most hospitable mansion, although the doors may be flung open to receive him. In the bushy hemlock the owl is found dozing, while the swamps croak with bullfrogs and bitterns. During the cold frosty nights, the trees creak, as if ten thousand *bûcherons* were at them with their hatchets. On the banks of the wild rivers are curious trodden paths—these are the walks of the wolves, foxes, deer, &c. These roads the Indians always adopt when on their journeys. Places called *deer-holes* are also frequent; these are salt-marshes, where the deer assemble to lick the saline soil. Hunters looking for the animals avail them at these marshes with their guns, and shoot scores of them. When a man loses his way, he follows down the first running brook he comes to, and this never fails to conduct him to the banks of some river, where he generally may obtain information of his situation. The Indian writes his letters on the bark of a tree, and places them in some post-office well known to his tribe; which post-office is generally an old hollow cedar. Thus they conduct their business in the bush, and breathe sighs to their squaws from Lake Simcoe, perchance, to beyond the Rocky Mountains.—*MacLaggart's Canada.*

EDUCATION IN AMERICA.

In most of the states of the American Union, if not the whole, there are now schools established by the legislatures for the education of all the youth, in reading, writing, and arithmetic, and supported by a public and general tax. This system was adopted in Massachusetts as early as 1647. "All here (says an American writer) can read and write, and rarely can one be found not qualified by education to transact the common concerns of life. To educate his children is the first object and the chief glory of the parent; their ignorance is to him and to them disgraceful. In these schools the mind receives its first impulse in the career of learning; an impulse which carries many forward to high stations of honour and of usefulness." England, it may be seen, has therefore been completely outstripped by the United States, as regards its institutions for the general diffusion of elementary instruction.

PATIENCE OF GEORGE III.

Never, perhaps, was his patience more tried than at a private audience which he gave to Lord George Gordon. On being admitted to the king's presence, his lordship very unceremoniously locked the door, which the lord in waiting had purposely left open. He then said he had an excellent pamphlet in his pocket, which he would do himself the honour, and his majesty the pleasure, of reading. He accordingly began the pamphlet, and the king listened very patiently till it began to grow dark, when he observed, "I am sorry, my lord, that light fails you, but some other day." "Please your majesty," replied Lord George, "there is no time like the present, and as for light, a little of that will suffice for me." He then familiarly poked the fire, the blaze of which enabled him to continue the pamphlet, which he read to the last word. The king expected now to be released, but, to his amazement, Lord George said, "Please your majesty, I have read to you ten or eleven excellent letters which I have received from your Protestant subjects, in which none were, nor ever will be, surpassed." He then commenced the letters, and this vexatious interview lasted two hours longer, at the termination of which, the fire having gone out, or, ceased to blaze, Lord George departed.—*The Georgian Era.*

ANECDOTE OF DAVID HUME.

About a fortnight before his death, he added a codicil to his will, in which he fully discovered his attention to his friends, as well as his own peasantry. What little wine he himself drank was generally port, a wine for which his friend the poet (John Home) had ever declared the strongest aversion. David bequeaths to his friend John one bottle of port, and, upon condition of his drinking this even at two down-sittings, bestows upon him twelve dozen of his best claret. He pleasantly adds, that this subject of wine was the only one upon which they had ever differed. In the codicil there

are several other strokes of railleury and pleasantry, highly expressive of the cheerfulness which he then enjoyed. He even turned his attention to some of the simple amusements with which he had been formerly pleased. In the neighbourhood of his brother's house in Berwickshire is a brook, by which the access in time of floods is frequently interrupted. Mr Hume bequeaths L.100 for building a bridge over this brook, but upon the express condition that none of the stones for that purpose shall be taken from a quarry in the neighbourhood, which forms part of a romantic scene in which, in his earlier days, Mr Hume took particular delight. Otherwise the money to go to the poor of the parish.—*Encyc. Brit. new edition.*

THE HERRING FISHERY.

WITHIN the last sixteen years, the herring fishery carried on in the Moray Frith has risen into great importance, and in a great measure usurped the place formerly occupied by the Caithness and other fisheries. The Moray Frith herring fishery commences in the middle of July, and the fish commonly leave the coast in the end of August or first of September. For the first four weeks the shoals are small and detached, and the fishings only average from two to five barrels per boat. Herrings are caught at this early stage of the fishing on the coast of Moray, nearly opposite the mouth of the Spey; but they swim in no determinate track. As the season advances, they come higher up, form into larger bodies, and pursue a route tolerably certain. At this second stage, the quantity of barrels caught by each boat averages from eight to fourteen. The point at which the shoals unite is a long narrow bank, lying in the middle of the Frith, nearly opposite the Bay of Cromarty, and which the fishermen term *Guilliam*, from the little conical hillocks on the northern shore with that name. The breadth of the ridge does not exceed half a mile, but its length is nearly thrice as much. There have been repeated instances of fishings prosecuted on this bank for the space of a whole week, at the average rate of eight hundred barrels per day; but the quantity of fish does not seem to undergo any diminution. In the beginning of the season the fish advance towards the spawning ground, but proceed so slowly, that in five weeks, supposing them to move in a direct line, they only swim about thirty miles, till they reach the bank, on which they generally remain stationary. Immediately on their ceasing to advance, they begin to spawn, and, when emptied, they turn down the Frith, and swim with such rapidity as to remove beyond the reach of the fishermen in a single night. Their stay on the spawning ground varies from four to ten days, and this is the time when the fishery is prosecuted.

The set of nets employed in fishing by each boat is termed a drift, and the number varies from sixteen to twenty-six. The length of each is sixteen fathoms, and the depth four. The upper edge is bordered by a strong rope laced through square perforated pieces of cork, and termed the cord-baulk. The lower is bound with a cord called the ground-baulk, and furnished with loops for sinkers. These baulks, both lower and upper, are about four feet larger than the body of the net, and by their ends the whole nets of the drift are tied together. At each fastening, that is, between every two nets, a buoy is attached. By all these means, the nets hang or float in nearly a sloping direction, and present a barrier to the progress of the herring shoal; and as the boats sail to and fro, but chiefly against the tide, the herrings strike the meshes of the nets, and being thereby entangled, they are hauled up by the boatmen as soon as a sufficient weight of fish is in the net. The fishermen are first apprised of the nets coming in contact with the shoal by the sinking of the buoys. When the wind is high, the track of a moving shoal is shown by the appearance of the water, which, however rough in other places, is of a dead smoothness over the herrings, and looks as if coated with oil. When one of these calm patches crosses the line of the drift, the fishermen prepare to haul, and are seldom disappointed of a fishing. A slight pull is sufficient to bring to the surface a net charged with live herrings, which, if suffered to remain in the water until the fish died, would defy the united efforts of the crew to raise from the bottom.

The profession of the herring fisherman is one of the most laborious, and most exposed both to hardship and danger. From the commencement to the close of the fishing, the men who prosecute it pass only two nights of each week in bed. In all others they sleep in open boats, with no other covering than the sail. In wet weather their hard couch proves peculiarly comfortable; and even in the most pleasant, it is one upon which few besides themselves could repose. The watchfulness necessary in their circumstances becomes so habitual, that during the fishing their slumbers rather resemble those of the watchdog than of men. They start up on the slightest motion or noise, cast a hurried glance over the buoys of their drift, ascertain their position with regard to the fishing bank, or to the other boats around, and then fling themselves down again. During the height of a stream-tide their occupation is doubly harassing. It not unfrequently happens, that, when shooting their drift, the nets thrown out are caught by the vortices of an eddy, and ravelled together in such a manner that hours elapse, those too, it may chance, the hours of midnight, before they can be disentangled. At such seasons, also, these drifts come in contact with those of other boats, and to free them is one of the most laborious employments of the fisherman. The herring caught in the Moray Frith and adjacent seas on the eastern shore of the north of Scotland, are cured in various towns along the coast, and after engaging the

industry of a large portion of the population, are exported to all parts of the world.

The preceding sketch has been abridged from a pamphlet, entitled "Letters on the Herring Fishery in the Moray Frith," which originally appeared in that intelligent provincial print, the *Inverness Courier*.

SCOTTISH PARLIAMENT BEFORE THE UNION.

THE number of Peers in the Scottish Parliament was latterly 160, and of Commons 155. The latter were divided into Members, or Commissioners (as they were called) for shires and burghs, and all sat in one house, and voted promiscuously.

On the meeting of Parliament, the members went to the house in great solemnity; and the procession which they formed, on account of the predominance of equestrian figures (for all except inferior servants were on horseback), was called the *RIDING OF THE PARLIAMENT*. This scene of splendour is spoken of in Scotland with feelings of enthusiasm, even to this day.

When the King, or Lord Commissioner, was ready, the members mounted their horses in the court before Holyrood Palace. The burgesses went foremost, in pairs, each attended by a lacquey, two trumpeters, and as many pursuivants; leading the way. Next came the Commissioners or Knights of shires, two by two, each having two pages. Then came such officers of state as were not noblemen; and two door-keepers of the council brought up the rear. Next to them rode the Lords, two and two, in their robes, their order being arranged according to their rank and precedence. Four trumpeters, four pursuivants, six heralds, and the gentleman-usher of the white rod, followed the Lords. Next, the Lyon King at Arms, bareheaded, in proper habiliments and foot-mantle, with his baton in his hand. Next came the sword of state, the sceptre, and the crown, carried by three of the ancient nobility, bareheaded, and supported by mace-bearers. After them came a nobleman, bearing a purse which contained the warrant of the Lord High Commissioner. Last of all came that great officer himself, with the Dukes on his right, and the Marquises on his left. When the King was present, the master of the horse rode near, but a little aside. Each Duke had eight lacqueys; a Marquis had six; an Earl four; and the Viscounts and Barons had three. Every nobleman had a gentleman to bear his train.

In the time of episcopacy, the two Archbishops were allowed the equipage of Dukes, and the Bishops that of Lords. When the King was present, the Marquises rode after the Earls, the Dukes after the Marquises; then the Lord Chancellor immediately before the King, bearing the great seal. The lacqueys had over their liveries short velvet coats, embroidered with their badges, crests, and mottoes.

The great officers of state being robed, rode up from the palace about half an hour before the cavalcade, attended by their friends on horseback, and waited in the Parliament House.

When the High Commissioner entered, the Lord Chancellor took his purse, and ushered him from the bar to the throne. When the King was present, the Lord Chancellor received his Majesty at the door of the Parliament House, and ushered him up to the throne. All the members of Parliament waited on the King, or Commissioner, in the great hall; the noblemen in their scarlet robes, faced with ermine, according to their degree; the guards following, and the streets lined with the city guard and trained bands.

The throne was raised six steps, with a canopy of state over it. On the first step sat the Lord Chancellor, with other great officers on each side; on the other step sat the judges. On the right hand of the throne were two rows of benches, upon which the Archbishops and Bishops formerly sat. In the middle of the floor were two tables, one for the regalia; and near it, in two great chairs, sat the Lord High Constable and the Earl Marischal. At the other table sat the Lord Clerk-Register, with his deputies the Clerks of Parliament. The Commissioners for shires sat upon forms, on the right side; and the Commissioner for burghs on the left. If the King was present, he spoke to them in his robes, with the crown upon his head, and all the members standing uncovered; but the Commissioner appeared only in a common suit, and spoke uncovered.

The members returned in the same order, only the Constable and Marischal rode on the Commissioner's right and left hand, with caps of permission. The Lord Chancellor and Lord Privy Seal stood behind, till all withdrew; and then returned in the same state to the Palace as they came to the Parliament House.

The same ceremonial of riding was observed also on the last day of the Parliament, but not during the session.

Spaldin, in his *History of the Troubles, &c. in Scotland*, between the years 1624 and 1645, gives an account of the riding of Charles I.'s Parliament in 1633, different in a few particulars from the above, and perhaps more picturesque in detail. "In the first rank," says he, "rode the Commissioners of burghs, ilk ane in their own places, well clad in cloaks, having on their horses black velvet foot mantles; secondly, the Commissioners for barons followed them; thirdly, the Lords of the Spirituality followed them; fourthly, the Bishops, who rode altogether, except the Bishop of Aberdeen, who was lying sick in Aberdeen, and the

Bishop of Murray, who, as Eleemosynar, rode beside the Bishop of London, a little nearer the King; fifthly, followed the temporal Lords; sixthly, followed the Viscounts; seventhly, the Earls; after whom, the Earl of Buchan carried the sword, and the Earl of Rothes carrying the sceptre, riding side for side with each other; eighthly, the Marquis of Douglas carrying the crown, having on his right arm the Duke of Lennox, and on his left the Marquis of Hamilton, following them. Then came his majesty, immediately after the Marquis of Douglas, riding upon a chestnut-coloured horse, having on his head a fair branch of feathers, with a foot mantle of purple velvet, as his robe royal was, and none rode without their foot mantles, and the nobles all in red scarlet-furred robes, as their use to ride in Parliament is; but his majesty made choice to ride in King James IV.'s robe royal, which was of purple velvet, richly furred and laced with gold, which was carried up from the earth by five grooms of honour, ilk ane after another, all the way as he rode, to his Highness lighting; he had also upon his head an hat, and a rod in his hand. The heralds, pursuivants, mace-bearers, and trumpeters, followed his majesty in silence. In this order his majesty came frae the Abbey up the High Street, and at the Netherbow the Provost came and saluted the King, and still attended him while he lighted. The causeway was railed frae the Netherbow to the Sinking Style (a narrow passage between the east end of the Tolbooth, and the west end of the contiguous line of buildings called the Luckenbooths, all of which are now demolished), with stakes of timber dung (driven) in end, on both sides, yet so that people standing without the samen might see well enough; and that none might hinder the King's passage, there was within the rails a strong guard of the townsmen, with picks, partisans, and muskets, to hold off the people; and withal the King's own English foot-guard, with partisans in their hands, was still about his person. Now, his majesty, with the rest, lighted at the Sinking Style, where the Earl of Errol, as Constable of Scotland, with all humility received him, and conveyed him through his guard, to the outer door of the High Tolbooth, and the Earl Marischal of Scotland likewise received him and conveyed him to his tribunal, through his guard, standing within the door, and set the King down. After his majesty, all the rest followed; the Marischal, Prelates, and Nobles, all after their own degree; then the Earl of Errol sat down in a chair, and he in another, side for side, at a four-nooked taffel set about the fore face of the Parliament, and covered with green cloth."

THE WIDOW OF CHARLES STUART.

LADY MORGAN, in her "Book of the Boudoir," gives the following account of this lady (originally a German princess) in 1820:—

"Talking of the accidents, incidents, and odd conjunctions of travelling, it happened, one fine autumnal morning, at Florence, that my illustrious countryman, Mr Moore, my husband, and myself, were seated on a sofa in our old palace in the Borgo Santa Croce, looking at the cloud-capt Apennines, which seemed walking in at the windows, and talking of Lord Byron—from whose villa on the Brenta Mr Moore had just arrived—when our Italian servant, Pasquali, announced 'the Countess d'Albany.' Here was an honour which none but a Florentine could appreciate! for all personal consequence is so local! Madame d'Albany never paid visits to private individuals, never left her palace on the Arno, except for the English ambassador's, or the Grand Duke's. I had just time to whisper Mr Moore, 'the widow of the Pretender! your legitimate queen! and the love of your brother poet, Alfieri,' and then came my turn to present my celebrated compatriot, with all his much more durable titles of illustration: so down we all sat, and 'fell to discourse.'

I observe that great people, who have been long before the public, and feel, or fancy, they belong to posterity, generally make themselves agreeable to popular writers; and they are right; for what are the suffrages of a titled coterie, which can 'bear but the breath and supplance of an hour,' to the good opinion of those whose privilege it is to confer a distinction, to awaken an interest that vibrates to the remotest corner of the known world? Kings may give patents of nobility—genius only confers patents of celebrity. One line from an eminent writer will confer a more lasting dignity than all the grand and arch dukes that ever reigned from Russia to Florence can bestow.

Madame d'Albany, already forgotten as the wife of the last of the royal Stuarts, will live as long as the language of Dante lasts in the lines of Alfieri.

The Countess d'Albany could be the most agreeable woman in the world, and upon the occasion of this flattering visit she was so. She could also be the most disagreeable; for, like most great ladies, her temper was uncertain; and her natural hauteur, when not subdued by her brilliant bursts of good humour, was occasionally extremely revolting. Still she loved what is vulgarly called fun, and no wit or sally of humour could offend her.

We had received very early letters from London, with the account of the king's death (George III.). I was stepping into the carriage, to pay Madame d'Albany a morning visit, when they arrived; and I had them still in my hand on entering her library on

the *roi-de-chaussée*, where I found her alone and writing, when I suddenly exclaimed, with a French theatrical air,

'Grande Princesse, dont les torts tout un peuple deplore, Je vien vous l'annoncer l'usurpateur est mort !'

'What usurper?' asked Madame d'Albany, a little surprised, and not a little amused.

'Madame, l'Electeur d'Hanovre cesse de vivre !' The *mauvaise plaisanterie* was taken in good part; for, truth to tell, though the Countess d'Albany always spoke in terms of respect and gratitude of the royal family, and felt (or affected) an absolute passion for his present majesty, whose picture she had, she was always well pleased that others should consider her claims to the rank of queen as legitimate, of which she herself entertained no doubts. She, however, affected no respect for a husband, whom, living, she had despised for his vices and hated for his cruelty."

SUPERSTITION OF THE HORSE-SHOE.

THE horse-shoe was of old held to be of especial service as a security against the attacks of evil spirits. This virtue may have been assigned, perhaps, by the rule of contraries, from its being a thing incompatible with the cloven foot of the Evil One; or from the rude resemblance which the horse-shoe bears to the rays of glory which in ancient pictures are made to surround the heads of saints and angels; or, finally, from some notion of its purity acquired in passing through the fire. This latter supposition receives some countenance from the method resorted to for the cure of horses that had become vicious, or afflicted by any distemper which village farriery did not understand; such disease was invariably attributed to witchcraft, and the mode of cure seems to imply the belief that the imperfect purification by fire of the shoes which the animal wore, had afforded an inlet to malevolent influences. Accordingly, the horse was led into the smithy; the door was closed and barred; the shoes were taken off, and placed in the fire, and the witch or warlock was speedily under the necessity of removing the spell under which the animal suffered.

We have a farther proof that the efficacy of fire constituted a part of the virtues inherent in the horse-shoe, in the manner of reclaiming bewitched milk. All who have the management of a dairy know that at certain seasons of the year butter will not "come" from cream, nor milk be converted into curd, with the same ease as at others. The modern reasoners on the causes of things look upon this as being occasioned by the sort of food the cattle take; but all the farmers' wives of last century know perfectly well that it was the effect of nothing else but some envious person's evil eye, and they took their measures accordingly. On the return of the milkmaids from the loaming with their milking pails upon their heads, when the foremost took down her vessel in order to pass under the doorway, the mistress was ready to drop a horse-shoe heated red-hot into the milk. It was necessary that the ceremony should be performed at the instant when the young woman was lowering the pail; and as it was farther required that no one should be aware of the good dame's intention, the troop of milkmaids was often thrown into the utmost dismay by the sudden bubbling and hissing, and the screams of their companion more immediately concerned. The loss of the whole meal of milk was the usual consequence, to say nothing of the work created for the cooper by the crash of tumbling cogs; but these were matters of inferior importance, the future productiveness of the milk being an ample set-off against lesser mischances—and *that*, it need scarcely be added, was invariably secured.

A horse-shoe was commonly nailed upon the doors of the cowhouses; but this was not at all times a sufficient protection, as in summer the cows were not driven home at night, but milked a-field, and shut up in an open enclosure. When people began to be half ashamed of superstition, instead of nailing the horse-shoe on the outside, they fixed it to the inside of the doors both of dwelling-houses and farm-offices, and in that situation it may at this day be detected in many parts of the country. Thus the devil, though not openly defied, might come to burn his fingers if he were to attempt an entrance.

Sailors are, or were, for the most part careful to have a horse-shoe nailed to the mizen-mast, or somewhere on deck near midships, for the protection of the vessel.

The Chinese have their tombs built in the shape of the horse-shoe, as we are informed by Captain Hall, in his voyage to Loo Choo; which custom is very curious, as it may be fairly regarded as a branch of the superstition prevalent among ourselves.

BOOK-TRADE OF FRANCE.

The activity of the French press has been very greatly increased since the downfall of Napoleon. The Count Daru, in a very instructive work, *Notions Statistiques sur la Librairie*, published in 1827, estimated the number of printed sheets, exclusive of newspapers, produced by the French press in 1816, at 66,852,883, and in 1825, 128,011,483! and we believe that the increase from 1825 down to the present period has been little if any thing inferior. The quality of many of the works that have recently issued from the French press is also very superior; and it may be doubted whether such works as the *Biographie Universelle*, the new and enlarged edition of the *Art de vérifier les Dates*, in 38 vols. octavo, and the two octavo editions

of *Bayle's Dictionary*, could have been published in any other country. The greater number of new French works of merit, or which it is supposed will command a considerable sale, are immediately reprinted in the Netherlands, or Switzerland, but principally in the former. To such an extent has this piratical practice been carried, that it is stated in the *Requête* presented by the French booksellers to government in 1828, that a single bookseller in Brussels had, in 1825 and 1826, and the first six months of 1827, reprinted 318,615 volumes of French works! Having nothing to pay for copyright, these counterfeit editions can be afforded at a lower price than those that are genuine. This is a very serious injury to French authors and publishers, not only by preventing the sale of their works in foreign countries, but from the ease with which spurious copies may be introduced into France.

DESCRIPTION OF ALMACK'S, BY A "GERMAN PRINCE."

The first Almack's ball took place this evening; and from all I had heard of this celebrated assembly, I was really curious to see it; but never were my expectations so disappointed. It was not much better than at Brighton. A large bare room, with a bad floor, and ropes around it, like the space in an Arab camp parted off for the horses; two or three small naked rooms at the side, in which were served the most wretched refreshments; and a company into which, in spite of the immense difficulty of getting tickets, a great many "nobodies" had wriggled; in which the dress was generally as tasteless as the *tour-nure* was bad—this was all. In a word, a sort of in-entertainment; the music and the lighting the only good things. And yet Almack's is the culminating point of the English world of fashion. This overstrained simplicity had, however, originally a motive. People of real fashion wished to oppose something extremely cheap to the monstrous *faste* of the rich *parvenus*; while the institution of lady-patronesses, without whose approbation no one could be admitted, would render it inaccessible to them. Money and bad company (in the aristocratical sense of the word) have, however, forced their way; and the only characteristic which has been retained is the unseemly place, which is not unlike the "local" of a shooting-hall in our large towns, and forms a most ludicrous contrast with the general splendour and luxury of England.

THE WIDOWER.

BY THE HONOURABLE MRS NORTON.

I saw the widower mournful stand,
Gazing on the sea and the land;
O'er the yellow corn and the waving trees,
And the blue stream rippling in the breeze.
Oh! beautiful seem the earth and sky—
Why doth he heave that bitter sigh?
Yain are the sunshine and brightness to him;
His heart is heavy, his eyes are dim.
His thoughts are not with the moaning sea,
Though his gaze be fixed on it vacantly:
His thoughts are far, where the dark boughs wave
O'er the silent rest of his Mary's grave.
He starts, and brushes away the tear;
For the soft small voices are in his ear,
Of the bright-haired angels his Mary left,
To comfort her lonely and long bereft.
With a rush of sorrow he turns to press
His little ones close with a fond caress,
And they sigh—oh! not because Mary sleeps,
For she is forgotten—but that he weeps.
Yes! she is forgotten—his patient love,
The tenderness of that meek-eyed dove,
The voice that rose on the evening air,
To bid them kneel to the God of prayer,
The joyous tones that greeted them, when
After a while she came again—
The pressure soft of her rosy cheek—
The touch of her hand, as white and weak
She laid it low on each shining head,
And bless'd the sons of the early dead!
All is forgotten—all past away
Like the fading close of a summer's day;
Or the sound of her voice (though they scarce can tell
Whose voice it was, that they loved so well)
Comes with their laughter, a short sweet dream—
As the breeze blows over the gentle stream,
Rippling a moment its quiet breast,
And leaving it then to its sunny rest.
But he!—oh! deep in his inmost soul,
Which hath drunk to the dregs of sorrow's bowl—
Her look—and her smile—and her gentle word,
Of the musical voice he so often heard,
And never may hear on earth again,
Though he loved it more than he loved it then—
Are buried—to rise at times unbid,
And force hot tears to the burning lid;
The mother that bore her may learn to forget,
But he will remember and weep for her yet!
Oh! while the heart where her head hath lain
In its hours of joy, in its sighs of pain;
While the hand which so oft hath been clasp'd in hers
In the twilight hour, when nothing stirr'd
Beat with the deep, full pulse of life,
Can he forget his gentle wife!
Many may love and smile in truth,
May love; but not with the love of his youth:
Ever amid his joy will come
A stealing sigh for that long-loved home,
And her step and her voice will gliding by
In the desolate halls of his memory!
—From "The Undying One."

SONG.

She died in beauty!—like a rose
Blown from its parent stem;
She died in beauty!—like a pearl
Dropp'd from some diadem.
She died in beauty!—like a lay
Along a moonlit lake;
She died in beauty!—like the song
Of birds amid the brake.
She died in beauty!—like the snow
On flowers dissolved away;
She died in beauty!—like a star
Lost on the brow of day.
She lives in glory!—like Night's gems
Set round the silver moon;
She lives in glory!—like the sun
Amid the blue of June!
—Sillery's *Eldrid of Erin*.

BATHING.

The great utility of bathing, as regards the establishment of sound bodily health, was fully explained some weeks ago in the *Journal*; and, for a particular reason, I again advert to the subject. The use of sea-bathing is sufficiently acknowledged, and the use of the warm bath is becoming more prevalent; but it unfortunately happens that few towns can command the first of these luxuries, and there are not many which can support the second. Most of the English manufacturing towns have been hitherto destitute of baths for the use of the populace, and this circumstance is very much to be lamented, more especially as such places have beside them the means of erecting and supporting hot and tepid baths to a large enough extent. There are few towns without steam-engines and boilers, and with little trouble the waste hot water would answer all the purposes of the bath. Already this scheme has been tried with great success at Leith. Two or three years ago, a private individual here erected an extensive suit of mills for grinding grain, moved by steam power, adding to the establishment a series of small apartments, furnished with excellent marble baths, and supplied with hot or cold, salt or fresh water, in the utmost abundance, from the tanks and boilers. He also fitted up a large tepid plunge bath, and spared no pains to render the establishment every way worthy of public support. Although sea-water is not to be had in inland towns, this is of comparatively little consequence, as hot fresh-water baths serve almost the same purpose. Let the proprietors of steam-works, therefore, begin to use up the overplus of their hot water in this manner, and, by accommodating the public at a low price, they will be almost certain of reaping a large profit. I would, however, suggest that there ought to be in each town a series of baths of this description appropriated to the use of the working classes; and I have no doubt but that many proprietors of steam-works will fit up baths, at their own charge, for the accommodation of those in their employment.

LIFE OF JOHN BUNYAN.

The events of Bunyan's life were few. He was born within a mile of Bedford, in the year 1628; his parents were braziers, and he was brought up to the same trade. He seems, by his own account, to have been rather dissipated in his youth, but he married early, and soon afterwards acquired decidedly religious habits. Being of a very enthusiastic temperament and vivid imagination, he was continually haunted by what appeared to him visions and heavenly revelations. Having taken means to disseminate his own peculiar notions, he was arrested as a dangerous person, and thrown into prison, where he remained for twelve years. It was here he wrote most of his works, which are very voluminous. He survived his confinement sixteen years, during which time he paid regularly an annual visit to London, employing himself in preaching, and superintending the publication of his different compositions. He died in the year 1688, aged sixty. He left behind him a widow, who had been his second wife, and three children. The year in which the first edition of the "*Pilgrim's Progress*" was published is not known. The second edition is preserved in the British Museum, and bears date 1678.

BRAVERY OF THE ABERDONIANS.

No civic community in Scotland has been so distinguished in history for their bravery in battle, and their resistance to foreign aggression, as the people of Aberdeen. They assisted Bruce in 1308, and having aided in vanquishing the English betwixt Old Meldrum and Inverury, they returned and put the garrison of Edward to the sword. They subsequently opposed, with great vigour, the landing of English troops at Dunnotar, and were defeated only after some severe fighting and slaughter. At the famed battle of Harlaw, which was a sort of pitched fight betwixt the Highlanders and Lowlanders, and took place in 1411, the citizens are known to have fought so bravely as to turn the fate of the day against Donald of the Isles and his tartaned host. In 1530, the Aberdonians repelled the attack of a body of Forbesses, with their usual intrepidity, and saved the town from being plundered. Seven years afterwards, they sent a large complement of men southwards to oppose the invasion of the English under the Duke of Somerset; and they nearly all perished on the well-fought field of Pinkey. The brave Aberdonians had also their share in the disastrous troubles of Charles I.'s reign. For the eminent services performed by the citizens during the wars of the independence, they received many privileges from Robert Bruce. In commemoration of a deed of extraordinary daring—namely, the destruction of the whole English that garrisoned the town in one night—they received, as a motto to their arms, the phrase "*Bon Accord*," which was the watchword on the occasion, and which is still used in common speech by the Aberdonians as a familiar name of the town.

EDINBURGH: Published, weekly, by W. and R. CHAMBERS, 19, Waterloo Place; ORR & SMITH, Paternoster-row, London; and GEORGE YOUNG, Dublin. Agent in Glasgow, JOHN MACLEOD, 20, Argyle Street; and sold by all other Booksellers in Great Britain and Ireland.

Subscribers in town may have the paper left at their houses every Saturday morning, by giving their addresses at 19, Waterloo Place. Price of a quarter of twelve weeks, 1s. 6d.; of a half year of twenty-four weeks, 3s.; and of a year, 6s. 6d. In every case payable in advance.

From the Steam-Press of W. and R. CHAMBERS.

EDINBURGH CHAMBERS'S JOURNAL

CONDUCTED BY WILLIAM AND ROBERT CHAMBERS, EDITORS OF "CHAMBERS'S HISTORICAL NEWSPAPER."

No. 30.

SATURDAY, AUGUST 25, 1832.

PRICE THREE HALFPENCE.

LEISURE.

THE most fallacious ideas prevail respecting leisure. People are always saying to themselves, "I would do this, and I would do that, if I had leisure." Now, there is no condition in which the chance of doing any good is less than in the condition of leisure. The man fully employed may be able to gratify his good dispositions by improving himself or his neighbours, or serving the public in some useful way; but the man who has all his time to dispose of as he pleases, has but a poor chance, indeed, of doing so. To do increases the capacity of doing; and it is far less difficult for a man who is in a habitual course of exertion to exert himself a little more for an extra purpose, than for the man who does little or nothing to put himself into motion for the same end. This is owing to a principle of our moral nature, which is called the *vis inertia*, literally, the strength of inactivity, but which I will explain at once to unlearned persons, by reminding them, that to set a common child's hoop agoing in the first place requires a smarter stroke than to keep it in motion afterwards. There is a reluctance in all things to be set agoing; but when that is got over, then every thing goes sweetly enough. Just so it is with the idle man. In losing the *habit*, he loses the *power* of doing. But a man who is busy about some regular employment for a proper length of time every day, can very easily do something else during the remaining hours; indeed, the recreation of the weary man is apt to be busier than the perpetual leisure of the idle. As he walks through the world, his hands hang unmuffled and ready by his side, and he can sometimes do more by a single touch in passing, than a vacant man is likely to do in a twelvemonth.

All this is exemplified fully in the actual practice of life. Who, I would ask, compose the class who perform most of the business of public charity? It is not those who are highly endowed with wealth and leisure. It is not in general those whom wealth has placed at ease, but the class of well-employed traders and manufacturers, who, to appearance, are entirely engrossed by their own concerns. These men will snatch an occasional hour from their well-employed lives—perhaps an hour that ought to be devoted to relaxation—and do you more real work in that time than an idle man would accomplish in the half of his yaw-yaw existence. What is curious, if you place the busy trader on the shelf, as no longer requiring to work for his subsistence, he immediately loses the power of doing these little superfluous acts of goodness. In getting out of the way of all exertion, he becomes unable to do any thing, even when he wishes it. On the same principle, men never give a job to a lawyer or any body else, who is not pretty well occupied. And this is from no irrational homage to the name of the man, as is sometimes thought; it is because the man who does much is most likely to do more, and most likely to do it well.

Let no man, then, cry for leisure in order to do any thing. Let him rather pray that he may never have leisure. If he really wishes to do any good thing, he will always find time for it, by properly arranging his other employments. The person who thus addresses the public has acquired the power of doing so, such as it is, not by having had a great deal of time at his own disposal, but solely by ravishing the inglorious hours which the most of men spend in unprofitable and unenjoyed pleasures, and employing them in the cultivation of his mind. There is an anecdote told of a French author of distinction, who, by regularly employing, in a few jottings, the five minutes which his wife caused him to wait every day while she dressed for dinner, at last formed a book; certainly not the least meritorious of his works. Hazlitt also remarks, that many men walk as much idly upon Pall Mall in a few years as would carry them round the globe. In fact, it may be said that to ask for leisure or time to do any ordinary thing, is equivalent to a confession that we are indifferent about doing it.

It is very fair that the busy man should be at ease at last. It is often the object for which he works. Neither can it be allowed that there is any absolute claim upon the wealthy to exert themselves for the good of the community. Wealth must be enjoyed as the possessor pleases, or it is no longer wealth, and one of the objects of industry is taken away. But it would be of vast importance—both to the wealthy idle themselves and to the community—if their tastes could often be directed to some beneficial employment within the range of their abilities and influence. It

is a shame to those who are entirely at their own disposal, that almost all the general good that is done in the world is done by those who are already overworked. It might rather be expected that the affluent, who have no particular business of their own to attend to, should devote themselves to the general good. This is the more particularly to be expected when we observe the worse than trifles upon which idle opulence generally employs itself. If actual vice be avoided, the most contemptible frivolities and paltry amusements are sought after, for the purpose of—disgraceful word!—*killing time*. Sometimes we find the universal necessity of doing something, taking a good direction, or one at least rather on goodness' side. The female part of the affluent world are often found to be actively benevolent; and nothing can be more laudable. But the ells of idle humanity, that every day walk the street in vain, are beyond all mensuration. Now, I am convinced, that if these leisurely persons only once fell into the way of employing themselves for some good end, they would find themselves far more comfortable than they are at present. They would suddenly feel the inspiration of a worthy purpose of existence. They would feel the self-importance of active exertion—the majesty of industry; that lofty feeling which even the hard-working housewife feels in increased proportion amidst the sloperies of a washing Saturday, and which gives to the early-riser his right to taunt and look down upon all the recumbent part of mankind. The gentlemen must think of it. They must up and be doing. It is, I repeat, a disgrace to them, in this universally busy scene, to let all the laurels of charity and kindness be carried away by those who have enough ado to obtain their own subsistence.

OXFORD.

"Unfaded in glory, unfailing in years,
The mother of Churchmen and Tories appears."

It is almost impossible for an untravelling Scotsman, even with the aid of Mr Ackerman's splendid publication, to conceive a distinct idea of Oxford. It is a kind of *VENICE OF THE LAND*, sitting upon the green and leafy meadows of central England, like that ancient capital upon the blue waters of the Adriatic; while, clear into the summer air, rise its numerous fanes and towers, with one immense dome presiding like a sovereign in the centre. Around it the level waters of the Isis and the Charwell press slowly on through masses of verdure and foliage, with a hundred merry skiffs gliding over their surface. Enter the city in any direction, and you immediately find yourself under the majestic shadow of some vast palace of learning, which oppresses you at once with the sense of its antiquity, and its overpowering dignity.

In Scotland, an *university* is one plain quadrangular house, generally placed in some crowded part of a commercial town. In England, an *university* (we are thinking of Oxford) consists of some four-and-twenty splendid buildings, few of them much less elegant, and many of them more so, than the Palace of Holyroodhouse or Heriot's Hospital at Edinburgh, and these are scattered throughout a small beautiful city, which is interspersed with other public structures of an equally magnificent nature. In Scotland, an *university* is chiefly a mere school for the completion of an ordinary classical education, or the instruction of young men in the duties of a very simple church establishment. In England, it is a fortress of literature, garrisoned by hundreds of learned personages, who batten in it most of their lives, like a set of well-fed monks, upon a simple showing that they possess a certain degree of literary accomplishment. While the Scottish establishment is a matter of bare utility of the present day, like a shop or manufactory, the English university seizes the imagination as a thing invested with much of the trappings of an ancient system of worship, redolent of the literary glories of a thousand past years, and full of all kinds of obsolete fashions and customs, which have the merit of being totally useless. In fact, there is all the difference between the two institutions which there is between an honest Scotch parish kirk and the graces of St Peter's or St Paul's.

The colleges in Oxford are generally built of a pale chalky stone, and, though there are many older buildings, the most of them show that elegant mixture of the Gothic and Grecian styles of architecture, which obtained in the reigns of Elizabeth and James I., and is now fast reviving in our country mansions. In al-

most every case they form a square, the front of which abuts upon some street or lane. The inner court of Christchurch measures 264 by 261 feet, and has a lake in the centre. But all the rest are smaller. Each of these communities is, to a certain extent, independent in itself, and is under the control of its own set of officers. The students, most of whom bear the designation of *commoners*, reside in apartments which they hire for themselves, and of which each purchases the furniture from his predecessor in occupancy. A hall, in which all dine together, generally occupies one side of the square. A chapel, in which they are compelled to attend prayers every day, often occupies another side, or is sometimes a detached and more magnificent building. Besides the officers, who have separate apartments, there are generally a certain number of learned inmates called *fellows*, who having duly qualified themselves by learning, are supported in a style of gentlemanly ease, with hardly any hardship in their situation except an inability to marry, till they are provided for with a church living, of which every college has a certain number in its gift; after which they may marry as they please. For every kind of person connected with the university, there is a particular sort of gown, and also a skull-cap, with a square top more or less decorated. The students, or, as they call themselves, the *men*, are all obliged, under penalties, to wear their *academicals* when they appear abroad. They are in general desirous of escaping this regulation, especially when they walk into the country; but, when caught by any of the proctors, even so much as *sporting beaver*, that is, wearing a common hat (for they have a cant name for almost every thing), they are sure to be put to some extra tasks. Dr Johnson was so devoted an adherent to all the practices of the university, that, whenever he visited it, even late in life, he resumed his academicals. The common undress gown is, however, so slight as to occasion very little inconvenience, while it must be acknowledged that a uniform costume adds much to the *esprit de corps*, which gives Oxford its peculiar character as a seat of learning, and perhaps assists in the preservation of more important rules.

The glory of Oxford is, that every thing about it is old, and long established, and respectable. Antiquity, in the phrase of Smith, would almost appear to have begun since this university attained the ripeness of maturity. This is particularly apt to strike a Scotchman, all of whose antiquities, in respect of native literature, are comparatively modern. If he visits Merton's, he finds that Duns Scotus, whom he supposes to be his countryman, and who lived six hundred years ago, studied in those venerable halls. He learns with a curious feeling that Antony Bek, the puissant Bishop of Durham, who aided Edward I. in his wars for the subjugation of Scotland, was once a quiet schoolboy here. He goes to Baliol's, and finds that Devorgilla, Princess of Galloway (then a savage province), is still "remembered in prayer" every day in chapel, for having fulfilled the designs of her husband for the foundation of this college; that husband being the father of John Baliol, King of Scots! In the hall, he sees a portrait of Wycliffe, the morning star of the Reformation; for Wycliffe was "of Baliol's." As he treads the street in front, he is startled into awe by being told that on this spot Ridley and Latimer testified, amidst the flames of persecution, their adherence to the Protestant faith. In the cathedral—for Oxford is an episcopal see—he is shown the tomb of Frideswith, a Saxon female saint (contemporary with Edward the Confessor), who had a priory here before the erection of even the present very ancient building. A college, founded by William of Wykeham, in 1390, is termed *New College*, from its comparative want of antiquity, although Scotland had not a college at all for twenty years later. He enters the glorious hall of Christchurch, erected by Wolsey, and which is nearly as large as the Parliament House at Edinburgh, and he is surprised with accounts of plays and pageanties got up here for the entertainment of Elizabeth, of Parliaments held in it by Charles I. and Charles II., when expelled from London by the plagues of pestilence or republicanism, and many regal shows besides; for Christchurch is the college where the sovereign always resides when visiting Oxford. In this splendid room he sees the lofty walls every where covered with the portraits of distinguished personages, who have been educated in Christchurch. Among them is the famous original portrait of Henry VIII., by Holbein, and also a picture of certain English divines of the

time of the civil war, who are represented as reading the prayer-book in secret, because it was then a proscribed book. Strange, a Scotchman thinks, that religious associations should here be appealed to, by an object which, in Scotland, is looked back upon as connected with persecution, and the cause of many civil broils. What would Jenny Geddes think?

In this hall several hundred students dine every day; and it is mentioned with envy by the commoners of less magnificent establishments, that the *men* here are a luxurious set of fellows—they take their meat off pewter plates with hot water underneath. (By the way, there seems to be far more silver than crockery used at Oxford: the existence of Wedgewood and Spode is a thing not yet acknowledged in this antique world-within-itself.) The very kitchen of Christchurch is a sight: it has a fire that would roast not only an entire ox, but an entire crocodile. To dine in hall in any of the colleges is a treat of the highest kind to a Scottish visitor. He sits under the shades of the mighty who have sat here before him. He sees around the generous youths from whom the future dignitaries of the land are to be selected. He eats the bounteous food which Old England supplies to her learned sons. He drinks out of silver cups, which were, perhaps, gifted to the college centuries ago by grateful pupils, then advanced to greatness. And when he contrasts all this comfort with the starveling condition in which learning too generally appears in his own country, he feels somewhat like the simple husbandman in Hogg's *Queen's Wake*, who was transported one night, by the powers of his witch-wife, into the King of France's wine-cellar, and permitted there to swill at his ease. This recalls to our memory an amusing anecdote of Dr Adam Smith, which we once lighted upon in a volume of the *Gentleman's Magazine*. Smith was one of the young men sent by Glasgow College to be educated at Balliol's, upon *Snell's foundation*—an endowment originally intended for the rearing of a certain number of Episcopal ministers, in order to propagate that form of faith in Scotland, but which has latterly become a mere piece of patronage in the hands of our western university. When Smith first came into the hall to dine, the *scout*, or servant, who brought in the roast beef, was much struck by the bashful, and, perhaps, somewhat grotesque appearance of the young Scottish stranger, who seemed confounded at the grandeur of every thing he saw around him. "Well, Sawney," said the servant, as he placed the groaning representative of English good fare upon the table, "did you ever see any thing like that?" What the future author of the *Wealth of Nations* said in reply, or whether he replied at all, is not recorded.

The real elegance and beauty of many of the objects in Oxford is, in the highest degree, gratifying to a person of taste. The enormous cone of the Ratcliffe Library, so beautifully proportioned, notwithstanding its size; the fine spire of St Mary's Church; the admirable tower of St Magdalen's; and, perhaps, more than all, the sweetly shaded walks which every where surround the city; seize and captivate the imagination. Among the ecclesiastical structures, the chapel of New College bears the first place for beauty. The choir is a hundred feet long, by thirty-five in breadth, and sixty-five in height; the ante-chapel, besides, is eighty feet long. Splendid windows of stained glass, a beautiful diced floor of black and white marble, seats and other furnishings of the most costly magnificence, mostly originating with Archbishop Laud, conspire to render this place of worship an object of the utmost interest. The writer of this article visited it during evening service. A train of robed ecclesiastics; with a few pupils of the college, entered, and took their seats in the desks arranged along the walls. Prayers were first chaunted, then some church music was sung by the choristers, who sat opposite. The organ, a remarkably fine instrument, lent its mellow notes to the general effect, which exceeded any thing of the kind he had ever known. The music, at a distance of more than a year, still haunts his mind in delicious snatches. After about an hour thus spent, the long train left the chapel in the same solemn wise; and concluded a scene which, we must confess, was as seductive to our Presbyterian mind, as ever the feminine vision was to St Augustine.

It is delightful to observe the keen feeling of appreciation with which every college holds up for its own glory the great names connected with it—how Queen's rejoices in Addison and Collins—Lincoln's in Wolsey—Christchurch in Peel, and a thousand great men before him—University in Eldon—Balliol's in Dr Adam Smith, and so forth. Each has its illustrious list, which constantly stands in the eyes of the present *alumni* as a motive for their exertions. Then every college has its own traditionary recollections. In the delightful "water-walk" of Magdalen's, you see a tree beneath which was Addison's favourite seat. You also recollect that it was the attempt of James II. to impose a Catholic head upon this college which helped so materially to forward the Revolution. You farther recollect the allusion of Pope to "Maudlin's learned grove." In reference to this college, and as a trait of the opulence of this learned scene in general, it may be mentioned that there is a deer-park connected with Magdalen's, in which, by the rules of the society, a certain number of those animals must always be kept.

Some of the customs of the university are exceedingly antique and curious, being kept up in accordance

with very ancient rules, in which any flaw, however trivial, might perhaps endanger the whole foundation. For instance, on New-Year's Day, the bursar presents a needle and a thread to every member of Queen's College, saying, "Take this and be thrifty." This is an old punning allusion to the name of the founder, Robert de Eglesfeld, who was confessor to Philip, consort of Edward III.; Eglesfeld being interpreted into *aiguille et fil*. Nor is this all. Hollingshed mentions in his history of England, that, when the Prince of Wales, afterwards Henry V., who was educated at this college, went to court, in order to clear himself from certain charges of disaffection, he wore a gown of blue satin, full of oilet holes, and at each hole a needle hanging by a silk thread. This is supposed to prove that the original academical habit of Queen's College was also fashioned in allusion to the name of the founder. While this and other customs are simple, and somewhat ridiculous, one kept up at Magdalen's is, in the highest degree, poetical. Previous to the Reformation, a mass was performed every May-day morning on the top of Magdalen Tower, for the soul of Henry VII., who had paid the college a visit in 1487. At the abolition of the Catholic worship, the mass was given up. But yet, early on every first of May, ten choristers ascend to the top of this tall and elegant tower, and there execute certain pieces of church music, for which they receive in remuneration ten pounds yearly out of the Rectory of Stainbridge, in Gloucestershire. The solemnity generally attracts thousands of visitors; and certainly it must be a sight of no common interest to see ten white-robed worshippers raising their voices far and high into the dewy calm of the May morn, as if they would rival the very lark, that at the same time pours its unpurchased music at heaven's own gates.

Another curious ceremony was once practised at Magdalen's. From a stone pulpit in a corner of the square was formerly preached an annual sermon to the members of the college, on the festival of St John; and in order that the scene might be rendered somewhat suitable, the whole place was fitted up with green boughs, to represent the wilderness in which that blessed apostle first announced the gospel. Some of our countrymen will be apt to declaim against these observances as rank Popery; but they would be Papists or any thing at Oxford.

As most of the young men at Oxford are the sons of parents in an exalted rank of life, their mode of living is appropriately a somewhat expensive one. It is a mistake, however, to suppose that any general system of prodigality prevails. Such of the youths as come here without the design of studying for a profession, lead perhaps a somewhat idle, and, it may often be, a dissolute life; but these would not be better in any other situation whatsoever. Most of the young men spend their mornings in close study in their own rooms, and only recreate themselves occasionally with a walk into the country, or a-boating on the river. As no wine is permitted at the general table in the hall, they often retire in little parties to each other's rooms, and crack a bottle or two together. Music is a favourite amusement amongst them, as is testified by the great number of music shops in the town, and by the frequent strains which are heard issuing from the rooms in the evenings. It is pleasant, in passing under their open windows, to observe here a flute, and there a guitar, hung against the walls within. It conveys the idea of innocent recreation, and of an accomplishment which always sits gracefully on youth. As every man is obliged, upon a penalty, to be in his own college at nine in the evening, it is very difficult to carry any entertainment to excess at Oxford. The bell of Christchurch, called the Great Tom, is then rung; and though, as their old song says,

"There's not a man
Will leave his can,
Till he hears the mighty Tom,"

yet they must sit no later, if they wish to preserve either their own comfort or their good character. The janitors, who are always respectable conscientious men, are rigorous in marking down any delinquency, and the aggregate of these at the end of the term, or season, always counts against a man in the eyes of his superiors, to whom he is to look for his honours. The Great Tom is a curiosity in his way. He formerly belonged to the neighbouring abbey of Ouseney, whence he was translated, at the Reformation, to the great tower of Christchurch. His rim was at that time inscribed with the following whimsical sentence:—

"In Thomæ laude, resono, Bim Bom sine fraude."
In the praise of Thomas, I sound Bim Bom without fraud; the meaning of which is certainly far from clear. However, Tom was re-cast in 1680, and his present inscription simply implies that he is the Great Tom of Oxford.

In the square of Christchurch, by the way, is shown a statue of Bishop Fell, who presided over the College in the reign of Charles II. It was either upon him, or upon his predecessor, Dr Samuel Fell, that the well known epigram was written—

"I do not like thee, Doctor Fell,
The reason why, I cannot tell,
But this at least I know full well—
I do not like thee, Doctor Fell."

This last Dr Fell, however, must have been a man of some sensibility, and we should suppose, not so utterly unamiable as the jest would represent him. He was a great royalist, and on that account was expelled by

the republicans in 1647. Two years afterwards, on hearing of the execution of Charles I., he immediately expired! It is also worth mentioning, that the celebrated Burton, author of the *Anatomy of Melancholy*, and who, as we have heard, was descended from Scottish parents, lies buried in the Cathedral connected with Christchurch College. We were much struck by his epitaph, which, if we recollect rightly, runs thus—

"Hic jacet Thomas Burton,
Cui vitam et mortem dedit melancholia."
Here lies Thomas Burton, to whom melancholy gave both life and death. Opposite to Christchurch, is the small and comparatively obscure institution called Pembroke College, in which Johnson received his education. His apartment is still pointed out.

Such, in fine, is Oxford—at least as Oxford appears to a native of our own country. The whole produces such impression of misty and entangling antiquity, that, after labouring under it for a day or two, it becomes a relief to see any object of expressly modern associations—such, for instance, as a Birmingham stage-coach. Reader, let us escape into the nineteenth century!

POPULAR INFORMATION ON SCIENCE.

HEAT—ITS PROPERTIES AND EFFECTS.

IN resuming the duty we have undertaken, of explaining in a simple and popular manner the principles of science, we again come forward, like the guide to a stranger in a foreign country, desirous of leading our young friends through the most agreeable paths to knowledge. Still no scholastic difficulties will be found to perplex or impede our progress; for there is now no necessity to affect, like the priests of old, an air of mystery in explaining the very simple means which nature takes to accomplish many of her most important and beautiful operations. Already we have spoken generally of light, and surely there is no person of any intellect or feeling who can fail to be affected by the exquisite beauty of its numerous and diversified phenomena; but another agent, as universally diffused, and as important, now claims our attention:—let us proceed to examine the properties and effects of heat, without whose benignant influence the earth would not pour forth its thousand streams, nor be clothed with verdure—nor the air be refreshed with genial moisture—nor the humblest of living beings be enabled to support its own bare existence.

When speaking of the nature of heat, we stated that most probably it consists of a peculiar and very subtle fluid, which interposes itself in greater or lesser quantities between the particles of all bodies—an opinion which seems sufficiently supported by the fact that heat may be readily transferred from one body to another, which certainly could not happen did it consist only of a certain vibration of the particles of the body itself giving rise to the sensation of heat. It is reasonable to consider—although, like light and the electric fluid, it cannot be weighed in our clumsy scales—that it is a substance distinct from the body which gives it forth, and it is called a fluid, because, like all fluids, it has a tendency to seek its own equilibrium; that is to say, to distribute itself equally in every direction.* If we suspend a red hot iron ball in an apartment, the heat from the iron escapes, dispersing itself equally through the cooler air, until the iron ball is reduced to the same temperature as the air by which it is on all sides surrounded. A fire burning in a grate communicates its heat equally in all directions, until every object in the room has arrived at the same temperature. By rarifying the air, and thereby producing motion in it, heat is very equally diffused through the air we breathe; and were it not for this tendency to equalize its distribution, it is obvious that it would accumulate in vast and irregular quantities, and we should be continually exposed to the most painful transitions, like the unhappy spirits described by Dante and by Milton, hurried incessantly from the sufferings of the most excessive heat to the equally intense agonies of the extremest cold:—

Thither by happy-footed furies hurld
From beds of raging fire, to starve in ice.

Heat, therefore, at all times seeks its own equilibrium; it also enters in greater or lesser quantities into the pores of all bodies; but some do not allow it to pass through them so readily as others. If we place the one end of a rod of iron in the fire, the heat from the fire passes so quickly through the whole length of the rod, that very shortly we cannot touch the other end without being burned; but we may hold the one end of a short stick, while the other is actually blazing, so slowly does the heat pass through the substance of the wood. Urns, coffee-pots, tea-pots, and other metallic vessels used for containing hot fluids, require ivory, bone, or wooden handles, which, on the same principle, being very slow conductors of heat, interrupt its communication to the hand. Those bodies which allow heat to traverse through them very quickly, are called good conductors—those that retard its progress, bad conductors of heat; and it has been found that the densest bodies are the best conductors. Silver, copper, gold, iron, allow heat to traverse them more readily than glass, wood, porous earths, and bodies of a looser texture. The hardest woods ge-

* Philosophers call this matter *Caloric*, and restrict the use of the word *heat* to the sensation it produces; but in this place, instead of using the word *caloric*, we prefer speaking simply of heat, or of the matter of heat.

nerally conduct heat best; and it is worthy of remark, that heat, seeking its equal distribution, rises from the earth, and is conducted along the longitudinal course of the woody fibres, rather than across them; so that the interior of a tree becomes of the same temperature as the soil whence it derives its nourishment. It is evident that bodies which are good conductors soon carry away the heat from those with which they are in contact; it is well, therefore, that porous earths are bad conductors, since, on this account, the soil on the surface of the globe retains, for a sufficient length of time, the temperature necessary for the evolution of seeds, and the growth of plants, shrubs, and trees. Fluids, owing to the mobility of their particles, receive and transmit heat better than solids; hence, when a hot body is plunged into water, it cools more quickly than it would do were it plunged into a mass of sand. Air is not a good conductor of heat, which is another admirable provision; for if it allowed its transmission as readily as the metals of which we have spoken, the heat from the surface of the earth would be so rapidly carried away, that no being, however humble in the scale of organisation, would be able to support life. Count Rumford, indeed, discovered that air, in a state of absolute rest, does not conduct heat at all—a fact of very considerable importance. On a hot summer day, when there is scarcely a breath of wind stirring, the oppression we feel is in a great measure owing to this cause, for we are then moving in an atmosphere which does not conduct away the accumulating heat of the body. Furs, wools, feathers, and loose spongy substances, are, for the same reason, bad conductors of heat; for the air which is retained between their interstices, and which is at rest, prevents its transmission through them. Such materials we choose, therefore, for winter clothing, not because they contain or impart any heat, but simply because they prevent its escaping from the body, and protect us at the same time from the external cold air. Thus protected, many bold and enterprising navigators have braved the winter of the northern regions, and lived with impunity amidst the appalling coldness of those dreary solitudes, which seem to place an insurmountable and eternal barrier against the further extension of human dominion.

Nature, prodigal in her beneficence, has, on the principle we have endeavoured to explain, provided an appropriate and adequate covering for the animals of every region on the face of the globe. Those that live in hot countries have the hair of their coat fine, thin, and short, as may be observed in the graceful antelope, the camel, and in the stupendous elephant. Again, in those that frequent more temperate climates, the hair becomes thicker and woolly, as may be observed in the horse, dog, and sheep. Lastly, in the coldest countries in high latitudes, the coat becomes shaggy, coarse, and thick, as may be observed by looking at the Lapland dog, arctic bear, or fox. Animals that live much in water—the beaver, otter, and other quadrupeds—are provided with the finest, longest, and thickest furs; and in all instances the fur is thicker on the parts of the body most exposed, more especially on the back, because the heat, escaping upwards, requires a greater obstruction in that direction. Birds frequenting the higher regions of the atmosphere require not only that their bodies should be light, but well protected from the cold, which, as we before explained, increases as we ascend into the higher regions of the air. Accordingly, we find that nature has not been unmindful of their exigencies; for in them the bones constituting the skeleton are hollow, and communicate with the lungs, so that they are continually filled with air, whereby the body is not only rendered light, but enveloped in a medium which does not readily carry off their natural heat. But this is not all; for their plumage, so beautiful to the eye of the spectator, is also an admirable protection against cold; for the quill, the shaft, and the web of the feather, are so constructed as to offer the necessary obstruction to the escape of heat. The feathers, too, vary in kind and in quantity according to the habits of the bird, the climate it inhabits, and the season of the year. We elsewhere observed, that dark substances absorb and retain more heat than light ones; and this may be the reason why the birds of tropical climates are provided with such bright and dazzling plumage, which cannot but reflect the rays of heat, which otherwise might be absorbed. Many birds frequenting the colder countries have a feathery covering nearly as bulky as their whole body; but the contrary is observed in the birds of warmer climates. Birds that frequent the water are provided with an admirable defence against the cold to which they are subjected; for between the ordinary plumage we find a more delicate feathery structure, called down, which protects the breast against the coldness of the wave, which, in swimming, it divides. The swan, which is a favourite bird on account of the exceeding grace it exhibits on the waters, and indeed all water-fowl, exhibit this admirable provision. But there are animals destined to live in the northern seas, which are exposed to a much more intense degree of cold, yet which are neither protected by feathers nor by furs. These are provided, however, with an equally efficient protection, for, beneath the skin, disposed in small cells, vast quantities of fat or thick oil are imbedded, which completely envelopes the whole body. Such is found in the walrus, the seal, and the whale; and the oil that is thence procured is well known to be a very important article in commerce. In all these instances

such coverings operate simply as non-conductors of heat; preventing at the same time the escape of the natural warmth of the body, and the penetration into it of the external cold. Man, taught by observation and experience, has taken advantage, as we have already observed, of these facts to supply himself with winter clothing; and according to the experiments of Count Rumford, it appears that hare fur and elder down are the warmest materials for such apparel; after which beavers' fur, raw silk, sheeps' wool, and cotton wool, and after them lint, or the scrapings of fine linen.

Here we may pause to remark, that in pursuing any subject connected with science, it is desirable, nay, absolutely necessary, to understand and remember every principle explained; because, however trivial it may at first sight appear, on proceeding further it may be found to constitute a most important link in the great chain we have to unravel. We presume, then, from what we have above stated, that it is understood that heat has at all times a tendency to distribute itself equally in all directions, and that some bodies allow it to pass through them more readily than others; which facts will now enable us to understand the cause of our sensations of heat and cold. When several bodies having the same temperature are placed in contact with each other, they each give out and receive the same quantities of heat, so that there is no increase of the temperature; but when bodies of different temperatures are placed in juxtaposition, the hotter gives out heat to the colder, the exchange always being from the hotter to the colder body, until the same temperature is established between them. Accordingly, when the hand grasps a body colder than itself, it becomes sensible of cold, because a portion of its heat is conducted away by the colder body; but if it grasp a body that is hotter than itself, then the body of higher temperature communicates heat to the hand, which becomes sensible of warmth. In all these instances the intensity of the sensation depends on the superior or inferior conducting power of the body grasped, for the more rapidly the heat is carried away from the hand, the more intense is the sensation of cold thereby produced. The carpet in a room, of usual temperature, feels nearly as warm as the hand; the table feels rather colder; the marble chimney-piece still colder; and the fire-irons coldest of all; but each of these will, on the application of a thermometer, be found of the same temperature, and the difference of the sensation is produced only by the greater or lesser rapidity with which they severally conduct away the heat from the body. Our sensations of heat and cold, therefore, are merely relative; for even ice, when transported into a room, the temperature of which is below the freezing point, will radiate heat. Snow appears cold to a healthy finger; but it is applied to a frost-bitten limb because it is warmer than the limb so affected; and the object is to apply heat in the most gradual manner. Two persons bathing will, according to the heat of each, find an apparent difference in the temperature of the same stream. A person arriving from India into England, in the spring of the year, will complain of the coldness of the season, although the residents in that country are beginning, at that period, to cast away their winter apparel. The danger which arises from going out of a heated ballroom, or theatre, is occasioned in this way by the transition of the warm body into a colder medium; by which, indeed, many lives are annually sacrificed, as it were, on the shrine of pleasure, and the seeds are sown, by which the fairest and loveliest of the land fall victims to lingering consumption.

So subtle and so universally diffused an agent is heat, that we at present have not discovered any kind of matter that is totally destitute of it, and its accumulation, or abstraction, in various bodies, must necessarily effect great changes in them. It is well known that the particles of all solid bodies are held together by a power of attraction which they exert among themselves, and which is called the attraction of cohesion, or aggregation; but no two particles of matter are ever in actual contact. Interstices of greater or lesser magnitude must exist between them; and it is into these that the matter of heat insinuates itself. It is evident, therefore, that heat must produce expansion; for by accumulating, it must distend these spaces, and force the particles bounding them to a greater distance from each other, whereby the whole body must necessarily be increased in bulk. But as this accumulation of heat causes an increase in the size, so must its abstraction, by diminishing the size of these interstices, and allowing the surrounding particles to approach nearer to each other, occasion the contraction of a body. An iron bar, when heated, cannot be made to enter an opening which, when cold, it will enter readily. Coachmakers avail themselves of this fact. In making carriage wheels, they place the outer large iron rim round the wheel while red-hot; then, as the iron rim cools, it contracts, and embraces more firmly the wooden framework of the wheel. The heat of summer alone is, even in this country, sufficient to occasion remarkable changes in the condition of metallic bodies; thus the centre arch of an iron bridge is higher in hot than in cold weather; the gate of an iron railing, which during cold weather will open and shut readily, will sometimes stick fast on a warm day, owing to there being a greater expansion of it and of the neighbouring railing than of the earth in which they are fixed. The pitch of a pianoforte or harp is lowered during a warm day; and although tuned in a

morning drawing-room, will become out of tune when the crowded party has heated the room, owing to the expansion of the strings being greater than that of the wooden framework of the instrument. The pendulums of clocks, the balance-wheels of watches, and many delicate metallic instruments, are thus affected by the change of season, or removal to a warmer or colder climate, to compensate for which, numerous very ingenious methods have been devised. Buildings of considerable size and strength are often very much injured by the expansion of the iron bars fixed in different parts of them, which only lately happened to Bow Church in London. In this church the bars of iron used to hold together the stones of its fine steeple expanded during summer, and forced the stones sufficiently apart to allow dust and sandy particles to lodge between them; nor is there any doubt but that, had it not been repaired soon enough, the whole edifice in the course of time might have fallen.

Accordingly, from what we have now stated, it must be obvious that the first effect of heat is the expansion of the body into which it enters; and when a still farther quantity is added, another change is produced, and the body, however dense it may be, is converted into a liquid. Silver, gold, iron, lead, tin, and all substances with which we are acquainted, excepting the diamond, which is a combustible body, and catches fire at a low temperature, may thus be liquified. The most remarkable circumstance attending liquifaction is this—when a body changes its state from a solid to a liquid, or from a liquid to a vapour, its expansion occasions a sudden increase of its capacity for heat, in consequence of which it absorbs an additional quantity, which becomes fixed, and so concealed as not to affect the thermometer. This is called latent heat. It is this addition of heat which occasions the body to pass from the solid to the fluid state; thus, when ice is converted into water, it absorbs as much heat as would, if it did not melt it, raise its temperature 140 degrees. On the other hand, before water can be converted into a solid state, it must, after being reduced to 32 degrees, part with this 140 degrees of heat, which occasioned it to exist in a fluid form. It is on this account that the processes of freezing and of thawing are slow operations; were it otherwise, the cold of a single night might suddenly freeze an ocean, and the heat of a single day suddenly convert the accumulated snows of winter into one sudden and frightful inundation. When water has been heated in an open vessel to the boiling point, instead of its temperature increasing, the additional heat escapes in the form of steam, and this steam absorbs 1000 degrees of heat, which immediately becomes insensible. It is for this reason that water projected on a raging fire so powerfully represses it, for the heat enters so rapidly into its latent state in the conversion of the water into steam, that it is soon abstracted from the burning body. We now, therefore, understand that, after expansion, the next effect of heat is to produce liquifaction; but if the heat be still continued, the material particles being forced to a still greater distance from each other, the liquid enters into a state of vapour. Water affords a good example of this, being very readily vapourised; indeed, it undergoes spontaneous evaporation at very low temperatures; but on the application of cold, the watery vapour is soon condensed. When steam is first formed, it is invisible, as may be observed by noticing it issuing from the spout of a kettle; but when it comes into contact with the colder air, it is immediately condensed, and assumes the appearance of a visible cloud. An immense quantity of water is continually evaporating from the surface of the earth. After a heavy fall of rain, the fields and roads are inundated, but the water soon disappears during a little subsequent fine weather. The Mediterranean Sea receives many large rivers; but the evaporation from its surface is so considerable as to prevent its increasing in size. The water thus evaporated from rivers, lakes, and seas, ascends into the air, and becomes condensed into clouds. It seldom happens in this country that the sky is perfectly transparent, but often, on a fine day, we may observe a cloud suddenly formed by a cold current of wind in the upper regions of the air, which rapidly condenses the watery vapour there into light fleecy clouds. Water, we may add, does not evaporate so quickly when still, as when agitated by a brisk wind; hence variable winds are generally regarded as the precursors of rain, and more rain falls during spring and autumn than during summer or winter.

When a body has absorbed a certain quantity of heat, it distributes it forth again; and in so doing, the heat passes off from its surface in rays or straight lines. When a solid substance is interposed, however, the rays of heat are intercepted, as happens when we use a handscreen to protect the face from the heat of a common fire. Professor Leslie, of this University, has made a number of curious and interesting experiments on this subject; and he found that a rough and dark surface projects heat better than a smooth and polished surface, so that metals do not radiate heat so well as other substances. Since bright metals project heat most feebly, vessels intended to retain their heat, as tea and coffee-pots, should be made of such materials. Steam-pipes intended to convey heat to distant apartments should be on this account bright in their course, but dark when they reach their destination. Were it not for this radiation, the earth which has been absorbing the sun's rays for many days would become parched up by the accumulation of heat; instead of

which, when the sun has set, it radiates it forth again into the circumambient air. The consequence of this is, that the surface whence this radiation takes place becomes colder than the surrounding atmosphere, and condenses the invisible vapour which the air always contains, into dew. Accordingly, dew is only deposited on those substances that are below the temperature of the air by which they are surrounded; and as filamentous substances radiate heat best, the dew appears in greater abundance where it is most wanted, on the grass of open plains rather than on bare earth, rocks, and masses of water. It is known that dew is deposited in the greatest quantity on a fine clear night, and that little is produced when the sky is overcast with clouds—the reason of which is, that the clouds, acting like a concave mirror, reflect back the radiated heat to the earth's surface, and so tend to keep it warm. Gardeners on this principle protect their tender plants, by covering them over with a mat or layer of straw, which protects them from cold, by preventing the heat being radiated away from them. Snow acts in the same manner; and by obstructing the radiation of its heat, keeps the earth below warm, while the air above is many degrees below the freezing point. Our own bodies radiate heat. When we go out into the open air at night, this radiation of heat induces a sensation of cold; and the coldness we experience is most intense when we are in an open country on a clear calm night. When it is cloudy, the heat is reflected back to us; and even in towns the reflection from the houses affords to us some compensation; but in the country, when the night is clear and calm, this radiation proceeds without interruption.

MYSIE AND THE MINISTER.

THAT eccentric genius, the late John M'Taggart, in his "Gallovidian Encyclopædia," says that Nathan M'Kie, the minister of Crossmichael, who died in the year 1781, was so much afraid of bogles, that he would not go out of a house at night, without some person going along with him, and holding him by the coat-tail, which assertion is strengthened by the following anecdote:—

Returning home from the manse of Kells on a hot summer day, he stepped off the road to rest his nag, and have a little chat with his old friend Snodgrass, who at that time rented the moorland farm of Tornorroch, at the junction of the Dee and the Ken. The farmer, and Nanny Nettle, his old maiden housekeeper, with nearly all the domestics, were busily employed in the kail-yard, striving to conduct a swarm of young bees into a new hive, by the rattling of old girdles, tongs, candlesticks, and such other articles about the steading as are usually put in requisition on such occasions.

Nothing could have been more agreeable to the minister of Crossmichael than to assist this rustic band in skepping the bees; and being well acquainted with all the rules since laid down by Bonar for the management of these insects, he soon succeeded in lodging the young community in their new habitation. Snodgrass was too good a landlord to allow his guest to depart without taking pot-luck, but it was unfortunately what is called in the country CAUL-KAIL-DAY, and the minister took only a few slices of a braxy ham; but what he wanted of *soddin* he made up in *sap*, of which few people ever left Tornorroch without a quantum sufficit.

Snodgrass was such a noted hand at the bottle, that it was said he could drink even Craigdarroch, the champion of "the whistle," a well-known Bacchanalian poem by Burns, blind, without being in the least tipsy himself—which made him more than a match for poor Nathan, who, when the sun was setting in the western horizon, supposed the reflection of that luminary in the "black water of Dee" to be an additional sun going down in the firmament. This the old maid Nanny Nettle took to be a sure indication that it was full time for the priest to be stepping homewards; and knowing how much he dreaded to be out under the cloud of night, and afraid lest on that account, if she allowed him to sit much longer, he might take the resolution of remaining for the night at Tornorroch, and, consequently, protracting his visit longer than she wished him to do, therefore took the liberty of reminding him how far he was from the manse of Crossmichael, and how soon the foxes would begin to howl in the neighbouring mountains. Another cheerer before mounting, and the stirrup-cup occupied so much time, that, ere he had passed the Boat-a-Rhone, the twinkling stars were overshadowed by the dark clouds that rose in the west, and spread over the arch of heaven, and the demons of darkness began already to haunt his heated imagination. His fear was greatly increased by a tinkling which he fancied he sometimes heard at a distance, and at first supposed to be the wedder-bell of some neighbouring flock; but as the sound seemed to follow him on his journey, he became satisfied that his opinion in that respect was not correct, and, as if he had suddenly discovered the mistake, he said to his old gerran, as she cocked her ears, seemingly as much afraid as her master, "Ah! I have it now! The bees have left their new hive at Tornorroch, and crabbied Miss Nettle is tinkling her tongs to wile them back again! What a time of night this is to be following bees! I wish my friend Snodgrass and Lady Nettle had not been plying the bottle a little too freely since I left them." Then reining up his mare, he turned back as if to convince the old

maid of the folly of her pursuit; but as he stood in breathless expectation of her approach, the tinkling sound died away in the evening breeze, filling the good man's mind at the same time with great consternation. But as soon as the mare recommenced her journey homewards, "What a fool I was," said he, "to think that the folk of Tornorroch were following me when the tinkling is actually in another direction; it is undoubtedly the sound of the vesper bell coming from that Catholic house of Glendinning there at Parton." For a few minutes he continued to be of this opinion, but as his mare advanced, every step convinced him more fully that the sound proceeded from her feet, and he fancied it was occasioned by her shoes being loose; his mind was then a little relieved, for he was just at the smithy of Black Baldie of Cogarth, who, upon the minister's desiring him to do so, examined the shoes of the horse, and declared them to be all firm and fast.

"You are certainly in your cups to-night, Baldie, as I have too frequently found you to be before, otherwise you would not say so; the mare's shoes have clinked one after another every step from the Boat-a-Rhone, and you must therefore put a good stout nail into each of them."

"Aweel," said Baldie, "a body shon'd na stand in his own light by refusing a job when he can get ane from sic a good customer," at the same time lifting his tool-box, and going through all the operations of horse-shoeing, without either drawing or driving a nail, so dexterously, that he of the manse was quite satisfied, and mounted again, praying that he might meet with no further interruption on the way. But at the first step the tinkling commenced as loud as formerly, not far distant from where he supposed the sound to have proceeded before, but not quite so near the earth. He now believed that the whole was undoubtedly an illusion of the Great Enemy of Mankind to gain an ascendancy over him for some unseen purpose.

In great preturbation of mind he arrived at the manse, where the beadle of the parish was in attendance to receive him. "Lord save us, sirs but you are late to-night." "Ay, ye may weel say that, John," was the reply; "but you little ken how my patience has been tried, and how the arm of Omnipotence has supported me through the dark watches of the night, since I left the haunted How of the Airds, where ye ken the deil was once seen making spoons, and he has clinked at my heels all the way. But let us overcome the foul fiend by prayer." John was as superstitious as his master, and hearing what he supposed to be an unearthly sound somewhere about the person of the priest, was equally terrified. To prayer they went, but all to no purpose, for as the minister staggered up stairs, the former ting-tang commenced, and sapient John stood motionless as a statue; but Mysie, the minister's maid, who was less afraid of bogles than either her master or his man, saw there was a "whaup in the rape" that would soon get dispelled; nor was she kept long in suspense.

The sound that was heard below indicated that the reverend gentleman had only trampled once across his chamber, when a sudden rap was heard on the floor, with a loud accompanying ting. "Ah!" cried John, "our master is triumphant at last; that is the sound of the foul fiend taking his departure: he is nae doubt in an unco fyke at being sae worsted." "If that be the case, I maun hae a parting glimpse of him," said Mysie, bounding up stairs; and, looking through the key-hole of the door of her master's chamber, she saw him lift a dark globular substance from the floor, which had seemingly fallen from a pocket in his coat, which he had cast off preparatory to going to bed, and had laid over the back of a chair, as was his usual custom; and as he held it in his hand, she heard him exclaim, "Gramercy! does what I so recently conceived to be a wedder-bell, the bees of Tornorroch, the vespers of Glendinning, the sound of my horse's shoes, and even the voice of Satan himself, turn out to be only this minikin table-bell, which I must have unconsciously pocketed in the kail-yard of my friend Snodgrass, after I had used it in skepping the bees. Had this mistake been discovered by my hairbrained maid Mysie, who is whiles fyking where she is no wanted, it might have proved unpleasant to me, as she would soon have made it ring over my whole parish, and then some ill-willy folk might have called John Barleycorn the father of it."

How the bell was returned to its proper owner, or if Mysie's account of it never met poor Nathan's ear, are particulars I have not been able to learn. But certain it is, that, from her recital, the lost bell of Tornorroch soon became a favourite fireside story in the Glenkens of Galloway.

DOLLS' EYES.

THOSE who are strangers to the extraordinary extent of manufactures in England, can have no idea of the amount of capital sunk, and industry exercised, on what might be termed the merest trifles. The following extract from the evidence given before a committee of the House of Commons, on the Report on Artizans and Machinery, and introduced with effect by Babbage into his late work on the Economy of Manufactures, illustrates this remark. The person examined was Mr Ostler, a manufacturer of glass beads, and other toys of the same substance, from Birmingham. Several of the articles made by him

were placed upon the table for the inspection of the committee, which held its sittings in one of the committee-rooms.

"Question. Is there any thing else you have to state upon this subject?

"Answer. Gentlemen may consider the articles on the table as extremely insignificant; but perhaps I may surprise them a little, by mentioning the following fact. Eighteen years ago, on my first journey to London, a respectable-looking man in the city asked me if I could supply him with dolls' eyes; and I was foolish enough to feel half offended; I thought it derogatory to my new dignity as a manufacturer, to make dolls' eyes. He took me into a room quite as wide, and perhaps twice the length of this, and we had just room to walk between stalks, from the floor to the ceiling, of parts of dolls. He said, 'These are only the legs and arms; the trunks are below.' But I saw enough to convince me that he wanted a great many eyes; and as the article appeared quite in my own line of business, I said I would take an order by way of experiment; and he showed me several specimens. I copied the order. He ordered various quantities, and of various sizes and qualities. On returning to the Tavistock hotel, I found that the order amounted to upwards of L.500. I went into the country, and endeavoured to make them. I had some of the most ingenious glass toy-makers in the kingdom in my service; but when I showed it to them, they shook their heads, and said they had often seen the article before, but could not make it. I engaged them by presents to use their best exertions; but after trying and wasting a great deal of time for three or four weeks, I was obliged to relinquish the attempt. Soon afterwards I engaged in another branch of business (chandelier furniture), and took no more notice of it. About eighteen months ago I resumed the trinket trade, and then determined to think of the dolls' eyes; and about eight months since, I accidentally met with a poor fellow who had impoverished himself by drinking, and who was dying in a consumption, in a state of great want. I showed him ten sovereigns, and he said he would instruct me in the process. He was in such a state that he could not bear the effluvia of his own lamp; but though I was very conversant with the manual part of the business, and it related to things I was daily in the habit of seeing, I felt I could do nothing from his description. (I mention this to show how difficult it is to convey, by description, the mode of working). He took me into his garret, where the poor fellow had economised to such a degree, that he actually used the entrails and fat of poultry from Leadenhall market to save oil (the price of the article having been lately so much reduced by competition at home). In an instant before I had seen him make three, I felt competent to make a gross; and the difference between his mode and that of my own workmen was so trifling that I felt the utmost astonishment.

"Question. You can now make dolls' eyes?

"Answer. I can. As it was eighteen years ago that I received the order I have mentioned, and feeling doubtful of my own recollection, though very strong, and suspecting that it could [not] have been to the amount stated, I last night took the present very reduced price of that article (less than half now of what it was then), and calculating that every child in this country not using a doll till two years old, and throwing it aside at seven, and having a new one annually, I satisfied myself that the eyes alone would produce a circulation of a great many thousand pounds. I mention this merely to show the importance of trifles; and to assign one reason, amongst many, for my conviction, that nothing but personal communication can enable our manufactures to be transplanted."

BIOGRAPHIC SKETCHES.

EDWARD DANIEL CLARKE.—*Concluded.*

THE stay of Clarke in Russia was of no long duration, and was rendered so disagreeable, first, by the savage tyranny of the emperor, and, secondly, by the evil character of his subjects—which, as being every where felt, was infinitely more annoying—that our traveller regarded himself among a civilised people when he reached Constantinople. In fact, he found himself in a sort of English society, which, congregating together at the palace of the embassy, engaged in the same round of amusements which would have occupied them in London. The time which these agreeable occupations left him was employed in searching for and examining Greek medals, and in viewing such curiosities as were to be found in Constantinople; among other things the interior of the seraglio, where no Frank, he says, had before set his foot.

Clarke next proceeded to Rhodes, the Gulf of Glaucon on the coast of Asia Minor, and thence by sea to Egypt, where the English fleet was then lying in Aboukir Bay. He did not, however, see much of Egypt on this occasion, for the country was still in possession of the French; and, therefore, after a short visit to Rosetta, he sailed for Cyprus, and on returning from this voyage, proceeded to Palestine. Here he visited Jerusalem, Nazareth, Bethlehem, the Lake of Gennesareth, near which he enjoyed an opportunity of conversing with a party of Druzes, or Israelites of Mount Lebanon.

His stay in Palestine was exceedingly short, just sufficient to enable him to say he had looked at it. He then returned to Aboukir Bay, where his brother was commander of an English ship, which now, on the 6th

August 1801, swarmed with French prisoners, like a beehive. When the road to Cairo was rendered practicable by the defeat of the French, our traveller proceeded to that city, where the most interesting objects existing were the beautiful young women who had been torn by the French soldiers from the harems of the bey, and then, when they evacuated the country, deserted and abandoned to their fate. Here he procured a complete copy of the "Arabian Nights," which, with many other works that were so many sealed books to him, gave rise to much unavailing regret that he had bestowed little or no attention on the Arabic language. The pyramids he of course admired. "Without hyperbole," says he, "they are immense mountains; and when clouds cast shadows over their white sides, they are seen passing as upon the summits of the Alps." From the pinnacle of the loftiest he dated one of his letters to England, all of which are filled with lively dashing gossip, accompanied with rash, headlong, unphilosophical decisions, which the reflection of a moment, perhaps, might have served to dissipate. The news of the capitulation of Alexandria induced him to hurry back to the coast. He found the French troops still in the city, but preparing to embark with all speed. Great disputes, he says, had already arisen between General Hutchinson and Menou respecting the antiquities and collections of natural history which had been made by the French; the former claiming them as public, and the latter refusing them as private property. The part performed by Clarke himself in this affair, we shall relate in his own words:—"When I arrived in the British camp, General Hutchinson informed me that he had already stipulated for the stone in question (the Rosetta marble), and asked me whether I thought the other literary treasures were sufficiently national to be included in his demands. You may be sure I urged all the arguments I could muster to justify the proceeding; and it is clear they are not private property. General Hutchinson sent me to Menou, and charged me to discover what national property of that kind was in the hands of the French. Hamilton, Lord Elgin's secretary, had gone the same morning about an hour before, with Colonel Turner of the Antiquarian Society, about the hieroglyphic table. I showed my pass at the gates, and was admitted. The streets and public places were filled with the French troops, in desperate bad humour. Our proposals were made known, and backed by a menace from the British general, that he would break the capitulation if the proposals were not acceded to. The whole corps of scavengers and engineers beset Menou; and the poor old fellow, what with us and them, was completely hunted. We have been now at this work since Thursday the 11th, and I believe have succeeded. We found much more in their possession than was suspected or imagined. Pointers would not range better for game than we have done for statues, sarcophagi, maps, MSS., drawings, plans, charts, botany, stuffed birds, animals, dried fishes, &c. Savigny, who has been years in forming the beautiful collection of natural history for the republic, is in despair. Therefore we represented to General Hutchinson, that it would be the best plan to send him to England also, as the most proper person to take care of the collection, and to publish its description, if necessary."

No man, I suppose, who has passed beyond the frontiers of his own country, can fail to have experienced frequent depressions of spirit, during which he has probably repented him of his wandering habits. But Clarke was like a weathercock, now pointing to the east, now to the west. In the island of Zea, off the promontory of Sunium, he repented heartily of having undertaken the voyage to Greece. "Danger, fatigue, disease, filth, treachery, thirst, hunger, storms, rocks, assassins, these," he exclaims, "are the realities" which a traveller in Greece meets with! Anon, at Athens, he writes, "We have been here these three days; we sailed into the port of the Piræus after sunset on the 28th. The little voyage from Cape Sunium to Athens is one of the most interesting I ever made. The height of the mountains brings the most distant objects into the view, and you are surrounded by beauty and grandeur. The sailors and pilots still give to every thing its ancient name, with only a little difference in the pronunciation. They show you, as you sail along, Egina and Salamis, Mount Hymettus and Athens, and Megara and the mountains of Corinth. The picture is the same as it was in the earliest ages of Greece. The Acropolis rises to view as if it were in its most perfect state; the temples and buildings seem entire; for the eye, in the Saronic Gulf, does not distinguish the injuries which the buildings have suffered; and nature, of course, is the same now as she was in the days of Themistocles. I cannot tell you what sensations I felt—the successions were so rapid, I knew not whether to laugh or to cry—sometimes I did both."

"Our happiness is complete: we have forgotten all our disasters, and I have half a mind to blot out all I have written in the first part of this letter. We are in the most comfortable house imaginable, with a good widow and her daughter. You do not know Lusieri. He was my friend in Italy many years ago. Think what a joy to find him here, presiding over the troop of artists, architects, sculptors, and excavators, that Lord Elgin has sent here to work for him. He is the most celebrated artist at present in the world. Pericles would have deified him. He attends us every where, and Pausanias himself would not have made a better cicerone."

"Athens exceeds all that ever has been written or

painted from it. I know not how to give an idea of it; because having never seen any thing like it, I must become more familiar with so much majesty before I can describe it. I am no longer to lament the voyage I lost with Lord Berwick; because it is exactly that which a man should see *last* in his travels. It is even with joy I consider it is perhaps the end of all my admiration. We are lucky in the time of our being here. The popularity of the English name gives us access to many things which strangers before were prohibited from visiting, and the great excavations that are going on discover daily some hidden treasures. Rome is almost as insignificant in comparison with Athens as London with Rome; and one regrets the consciousness that no probable union of circumstances will ever again carry the effects of human labour to the degree of perfection they have attained here."

Not one, after this, will accuse Clarke of being deficient in enthusiasm; but this is not all. On reaching the summit of Parnassus, he bursts forth into expressions of admiration, which, if they were not justified by the sublime beauty of the scenes themselves, or by the historical glory with which they must be eternally associated, would be absurd. "It is necessary to forget all that has preceded—all the travels of my life—all I ever imagined—all I ever saw! Asia—Egypt—the Isles—Italy—the Alps—whatever you will! Greece surpasses all! Stupendous in its ruins!—awful in its mountains!—captivating in its vales!—bewitching in its climate. Nothing ever equalled it—no pen can describe it—no pencil can portray it!"

"I know not when we shall get to Constantinople. We are as yet only three days' distance from Athens; and here we sit on the top of Parnassus, in a little sty, full of smoke, after wandering for a fortnight in Atica, Boeotia, and Phocis. We have been in every spot celebrated in ancient story—in fields of slaughter and in groves of song. I shall grow old in telling you the wonders of this country. Marathon, Thebes, Platea, Leuctra, Thespia, Mount Helicon, the grove of the Muses, the cave of Trophonius, Cheronea, Orchomene, Delphi, the Castalian fountain, Parnassus; we have paid our vows in all! But what is most remarkable, in Greece there is hardly a spot which hath been particularly dignified, that is not also adorned by the most singular beauties of nature. Independently of its history, each particular object is interesting."

From Athens they proceeded by land to Constantinople through ancient Thrace, by a route partly trodden by Poclcock. After a short stay at this city, they directed their course homewards through Roumelia, Austria, Germany, and France, and arrived in England after an absence of upwards of three years. Cripps now returned for a short period to his family, and Clarke, who had by this time acquired an immense reputation, took up his residence at Cambridge, where, with very few intervals of absence, he remained nearly twenty years. He was very soon rejoined by his pupil, the completing of whose education, together with the arranging of his curiosities and antiquities, and the composition of his travels, fully occupied his leisure for some time. A statue of Ceres, which our traveller had dug up, and sent home from Greece, was presented, on his return, to the university; in consequence of which the degree of LL.D. was conferred upon Clarke, and that of M.A. upon his companion.

In 1805, Dr Clarke published a "Dissertation on the Sarcophagus in the British Museum," which, though necessarily neglected by the public, is said to have given considerable satisfaction to the learned, and procured for its author many valuable acquaintances. Another, and a very different subject, employed his mind throughout a great part of the following year. This was no less a thing than matrimony; which, as soon as the idea got footing in his brain, occupied his ardent imagination to the exclusion of every thing else. His suit, however, was successful. The lady of his choice became his wife; and to increase this piece of good fortune, two livings, for he had entered into orders, were presented him by his friends, the one shortly before, and the other immediately after, his marriage. He now occupied himself with lectures on mineralogy, which were delivered at the university to crowded audiences, and were a source of considerable profit. This, as he expected, led to his appointment as professor of mineralogy; and "thus," says Mr Otter, "were his most sanguine wishes crowned with success; and thus were his spirit and perseverance rewarded with one of the rarest and highest honours which the university could bestow."

Dr Clarke now began to think of turning the treasures he had picked up in his travels to account; he sold his MSS. to the Bodleian Library at Oxford for £1,000, and his Greek coins to Mr Payne Knight for one hundred guineas. The publication of his travels next followed, and produced him a clear sum of £6,595. In the year 1814, his old passion for travelling revived, and an expedition was projected into the Grecian Archipelago, for the purpose of collecting antiquities, manuscripts, &c. But he was overruled by his friends, who probably believed that his constitution was now unequal to the fatigue which would be the inevitable attendant on such a mission. To this scheme he would appear to have been urged by the extravagant manner in which he had for some time lived; but a more practicable, or at least a more

certain mode of recovering from the effects of this false step, presented itself, which was no other than reducing his expenses, and living within his income. This he had the courage to undertake and execute, and from that day forward seems to have led the life of a sensible man. His passion now took a new turn, and he was wholly absorbed by chemistry. In September 1816 he wrote as follows to a friend:—"I sacrificed the whole month of August to chemistry. Oh how I did work! It was delightful play to me, and I stuck to it day and night. At last, having blown off both my eyebrows and eyelashes, and nearly blown out both my eyes, I ended with a bang that shook all the houses round my lecture-room. The Cambridge paper has told you the result of all this alchemy, for I have actually decomposed the earths, and obtained them in a metallic form."

The constitution of this enthusiastic traveller and man of letters could not endure this continued high-wrought mental excitement; and he died on the 9th of March 1822.—Abridged from *Lives of Celebrated Travellers*.

PRONUNCIATION.

THE inhabitants of the Scottish border counties, particularly in Roxburghshire, have a peculiar way of using the letter *g*, which, as the English use it in *gall*, they generally pronounce as in *gale*. The following dialogue, which passed a few years ago, at the inn at Hawick, between a gentleman travelling for a mercantile house in London, and a female servant who had just conducted him to the travellers' room, will serve as an illustration:—

Traveller.—Send the waiter here.

Servant.—Yes, sir—(goes out, but returns almost immediately.) What kind o' waiter do you want, sir?

Traveller.—Kind of waiter! Why, how many kinds have you?

Servant.—Twa, sir; *waiter-waiter* and *wall-waiter*.

Traveller.—*Waiter-waiter* and *wall-waiter*! And pray what is the particular distinction?

Servant.—Distinction, sir? Ou, the *yin* is soft and guid for washin', and the other hard and pleasant for drinkin'.

Our traveller was at a stand-still; he was literally done up. At last he desired the female to send both before him, that he might judge for himself, which she accordingly did; but his surprise came to a climax when she presented him with two jugs, which she said contained the *waiters* he desired. After no little trouble he discovered that the good people of Hawick pronounced the words *water* and *waiter* alike, and that the only difference between *waiter-waiter* and *wall-waiter* was, that the one was water from the river (or *water*), and the other water from the well (or *wall*). As for "waiting waiters" they had "nane"—they were a "waiting maids." The item for "fash" at the end of the traveller's bill was a tickler; but mine hostess contrived to explain it by saying, "it was answering the bell, cleanin' his shoon, and sick-like."

ANTIQUITY OF WHISKY.

There is pretty good evidence for supposing that no less a person than Osiris, the great god of Egypt, was the *first distiller of whisky* on record; for the Egyptians had, from time almost immemorial, a distillation or brewage from barley, called by the Greeks barley-wine, not inferior, they say, in flavour, and superior in strength, to wine. Allusion is made to this liquor in several passages of ancient writers. The poor people of Egypt drank it instead of wine, and were wont to intoxicate themselves with it, just as our poorer people do with whisky. It seems also to have been no stranger to the Hebrews; for reference is certainly made to it in the Old Testament, under the name of "strong drink," stronger than wine, and resorted to by determined drinkers for the sake of inebriation. Among the Celts in Spain and France, it seems to have been common as a substitute for wine; Polybius speaks of a certain Celtic kind of part of Iberia, or Spain, who affected great court pomp, and had in the middle of his hall golden and silver bowls full of this barley-wine, of which his guests and courtiers sipped or quaffed at their pleasure—a custom which, it is said, for many a century prevailed among his Celtic descendants, the reguli chiefs of our Scottish Highlands. The antiquity of this distillation is proved by the Egyptian tradition which ascribed its invention to Osiris. It may not improbably be supposed that the Egyptians communicated the invention to the Babylonians and Hebrews, who transmitted it northwards to the Thracians and Celts of Spain and Gaul, who, in their migrations north-westwards, carried it along with them into Ireland and our Scottish Highlands. Aristotle entertained an extraordinary notion of this potation. Those intoxicated with it, he says, fall on the back part of their heads; whereas those drunk with wine fall on their faces!

EPIGRAM.

Lieutenant Charles Gray, of his majesty's marine corps, and author of a volume of poems chiefly in the Scottish language, was once obliged by the boatmen at Deal to pay an exorbitantly high fee for carrying him out to his vessel. Recollecting that this was the scene of Gay's well-known marine ballad, he immediately penned the following epigram:—

When black-eyed Susan came on board—
If from the beach the Deal-men barged her—
I wish it had been on record,
How much those smuggling fellows barged her,

MILES ATHERTON.

THERE are many beautiful little dwellings of industrious men scattered through the suburbs of Manchester; and none who have viewed with consideration their honeysucked walls and the flowery gardens in which they stand, just out of the reach of the smoke and stir of the town, will doubt the good feeling and intelligence of the working classes. Manufactures have by no means that deteriorating influence on the character which some moralists would draw in such frightful colours. Industry at the loom may not be so poetical as industry at the plough, but surely it is not less intellectual. In manufacturing districts, where multitudes are gathered together, the vice that exists will force itself painfully on observation, while retired virtue often escapes notice; and in the din issuing at evening from the licensed haunts of the profligate, the passer-by is apt to forget the stillness of many a neighbouring fireside, where the operative is sitting happy with his wife and children, reading perhaps aloud, for their instruction and his own, or seeking out, should wages be low, the week's means by an occasional by-hour of skill and ingenuity.

In one of those dwellings, for which, if beautiful be too strong an epithet, let us substitute neat and comfortable, Miles Atherton had lived for ten years, and in his own little world of labour, had enjoyed an equal contentment—the only human felicity. His wife was from Scotland, the daughter of a shepherd—brought, when just woman-grown, from her native pastoral braes into the midst of a new life. But in the watchfulness of affection, she soon became familiarised with objects and occupations very different from every thing about her father's house, and in a few years the murmur of the sylvan Jed visited her ear only in some Sabbath dream. The working days were exclusively filled with delights and duties, joys and griefs, born and dying within the room where her husband and her children slept. Her parents had both died since she left Scotland; and though Mary Atherton and a few distant relations still mutually lived in each other's memory, yet in time and separation the living are almost like the dead, and, as they sometimes rise from oblivion, are but pleasant phantoms. But seldom as Mary Atherton, perhaps, now thought of Scotland, her simple and heartfelt voice spoke of her birth beyond the border, and now and then a wanderer from the "north country," directed by neighbours to her house, repaid her charities by telling her that he had been in her native parish, had seen the spire of the kirk, and the plaided shepherds on the hill.

The evil of poverty is not in the suffering which it wrings the heart, but in the poison which it too often mingles with the affections. Bread steeped in tears it is difficult to eat in thankfulness; and there is no blessing in the prayer in which there is no present hope. When earth stops its bounty, we despair of help from heaven; and the piety which worshipped God by the warm hearth, faints over the dead embers. The change on our whole moral nature may be slow, but it is sure. Each successive day is darkened and disturbed to the sullen or angry heart; beloved objects lose their charm; and things formerly abhorrent to our nature possess a spell over us which, loathsome though it be, we cannot break, and under whose infatuation we hurry on to guilt, despair, and death. For three months Miles Atherton was poor—miserably poor; and in other three, just as winter came, with all its severities, he was also profligate, miserably profligate. His pretty children, a boy and a girl, were taken from school; their mother's face had undergone a change like that of many years' sickness; and their house, so long the pride of the suburban village, looked as if it were uninhabited.

Mary Atherton, before the neighbours, endeavoured to look cheerful, and an honest pride sometimes supported her when better feelings had worked themselves out; but that strength was of avail only in the open daylight. When the door was shut, she often sat for hours without moving, in a sort of blind resignation; for the little work she could get or was able to do, could procure so small a portion of the very necessities of life, that she took it up only in hurried snatches, and would lay it down again in despair, when her eyes met those of her pining and sickly children. Misery had made her husband hard-hearted—almost brutal; so that often at midnight she trembled to unlatch the door for him, and dared not, till he slept, approach his bosom. Yet the poor creature loved him as well—better than ever; and kisses and tears he knew not of fell on his haggard countenance, disturbed even in his dreams. The time for advice or reproaches was gone by, and her last hope was in meek silence and uncomplaining sorrow.

One morning the unhappy man took his boy by the hand, and little Alec allowed himself to be led away without ever once venturing to look into his father's face. Fear had not quelled love in that innocent heart, but it had sunk its expression in his downcast eyes; and now he walked along as if conscious of some crime, and about to receive punishment. His father stopped on a bridge over a canal, and placing the boy beside him on the ledge, looked on him in gloomy silence. It was a lonely place—the water brown and muddy—and little Alec began, he knew not why, to weep. His father, incensed at the wailing sound, and distracted by an evil conscience, struck him on the face, and in an instant the child was silent; for this was the first time he had thus felt the hand

that used to stroke down so gently his hair over his forehead; and pain, fear, and wonder, checked sigh and speech. In a little while he heard his father groan, and then was lifted up on his bosom, and there forgot that cruelty as if it had never been. "Alec, my little Alec, would you be afraid to die?" "Yes, to be drowned, father; but not to die in my bed, with you and mother praying beside me, as you did when I had the fever in spring." A grim and hideous figure stood before them at these words, and, after some talking in a low voice, which the child feared to listen to, he felt himself alone in the grasp of a fiend, for his father had suddenly disappeared.

The winter came and went, and the mother knew not what had become of her sweet Alec, or if he were, as her husband said, yet alive in this miserable world. "Our boy is alive; but I could not support him, as you know, and he is apprenticed where he will do well enough, as the world goes, though he will have his hardships." How she herself was able to outlive all these months, was a mystery—an upbraiding to her weary spirit; for, surely, she often thought, had not other wretchedness killed all love within her, she had long since been in the churchyard. All that the kindness of her poor neighbours could do was lost upon her, and she accepted their charity without gratitude. They wondered how she was kept alive, for no one ever saw her at a meal; and often, on the bitterest days, there was not a spark of fire in the house. Her daughter was frequently wiled away into other dwellings, and fed and warmed: but the mother kept her room, like a ghost, and was often seen, by persons looking through the window, leaning with her head on the Bible, which she was nowise able to read, for her eyesight had failed her, and she was almost as one of the blind. "Oh, Mary, leave your worthless husband, and become one of us," sometimes said her best friend—herself with a large family, and very, very poor; but the wife strove to straighten her crouching frame at these words, and said, in a hollow whisper, "Never, never, till he lay me in my grave."

It was the evening of a spring holiday; and for a brief space forgetting, or at least laying aside their sorrows, almost every family, in street and lane, had gone out for amusement. Low as wages were, and provisions dear, parents laid out something on their own dress and that of their children, that they might not seem worse off than they really were; and sights and sounds of merriment were rife through the suburb. Mary suffered her daughter to join the festivities—at least she made no answer to the richly-ribbioned dame who came to invite her solitary child; and then fell back into that stupor which, to many eyes, often appeared to be a mid-day sleep. But the influence of this annual spring-holiday could not be wholly unfelt, far gone as she was in woe and want; and as the merry minstrelsy passed the door, she opened her eyes, and for one blessed moment thought she beheld little Alec, with some flowers wreathed round his hat, and dancing in his glee; but the vision and the music died away together, and she only uttered, "Perhaps it was his ghost!"

In an hour there was a knock at the door, which then slowly opened, and a soldier came in, seemingly off a long march. "Are you Mary Atherton?" said he, with a kind voice. "Yes; I am Mary Atherton: has my husband enlisted; and is he going away to a foreign country? Oh! that he could be suffered to stay for a week or two, and then he would have no widow to forsake." "I have come, my good woman, to tell you good tidings of your lost boy; his name, he says, is Alec, and he is not far off." He was indeed near at hand; for almost while the soldier was speaking, Alec was upon his mother's bosom—not in her arms—for they hung lifelessly—but in her bosom, and upon her neck; and perhaps his sobbings were not unheard in her swoon.

The mother recovered her senses, but not her speech; she held him now fast in her arms, as if about to bear him away from devouring fire; she loved more in that one dreadful clasp than she had ever loved in her whole life; and the thought of the great God was along with that of her first-born; so too was forgiveness of her husband—penitence for her impious sorrows, willingness now to die—and a desire—oh, how profound!—of yet a few days, months, years, of this mortal life!

A few words from her boy told the tale of a whole winter's miseries. A father had sold his child into slavery! All those pretty curls were gone, whose golden lustre had once been the joy of a proud mother's heart; the roses had left his cheek; and his little hands were wasted to the very bone, and covered with scars and wounds; his voice was low and timid, as if terror had pitched its key; but still, in all that rueful change, it was the same cheek, the same forehead, the same hair, the same hands, the same voice, the same smile! "O bitter, bitter cold—dreadful, more dreadful heat—and cruel, cruel stifling of that sweet breath, hast thou, my blessed Alec, too long endured! Yet beautiful is my boy as ever; nor think that I could not have known my boy had I seen him all begrimed in his wretchedness—heard but his small pattering footsteps—had it been even in the uttermost parts of the earth!"

The soldier who had rescued the poor sweep from slavery now rose to depart. The grateful mother began to request him to take some refreshment, and then her voice all at once ceased. After a pause she said—"You have brought riches into the house of po-

verty, for we have not at this blessed moment one morsel of bread!"

Mary was now left alone with her restored son, and that cold, dreary, desolate chamber was to her like one of the many mansions in the house of her heavenly father. With what divine happiness did she gaze on him kneeling once more by the bedside, and saying distinctly his unforgotten prayer! Hardly could she believe that he had indeed been brought back to her from the dreadful darkness of some remote region, till she lay down and took him into her bosom. Wearied and worn with his long journey homewards, and all at once made perfectly happy after so many horrid months, the boy soon fell asleep, and his warm breath thrilled through his mother's heart, to the entire possession of all its affections, and utter oblivion of all its long distress.

When little Alice came home from the merriment, her smiles met with a joyful return, that startled the affectionate girl with a new kind of happiness. Awe-struck by the face of her long-lost brother, covered with the placid light of sleep, Alice muttered not a word, as her mother withdrew the curtain, saying, "Bless God for his return." In a few minutes she was laid by his side, and, without awaking him, placed her little arm softly across his neck, and, closing her eyes, soon beheld him in the pastime of her innocent dreams. No fire burned on the hearth—not even a rushlight twinkled—but the moonshine filled the chamber with a sweet, solemn, and sacred light, and all within was thankfulness, piety, and peace.

"Not yet gone to bed!" said Miles Atherton, with a harsh voice, as he entered the room in that reckless and violent manner habitual to the profligate. His wife was now above the power of fear—no beating at her heart—no trembling in her limbs; for the comforter had been with her, and there was such an expression of blessedness on her countenance, as the moonlight showed it pale, wan, sunken, but rejoicing, that the wretched intruder was fixed in amazement, and calmed by the unexpected and inexplicable change of every feature. "Look here, my beloved husband, look here—look here!" and he beheld Alec and Alice fast asleep, and locked in each other's arms. "Yes, father, I love you—forgive you; will you let me kiss you, father!" murmured the boy, buried in a profound dream; and the sweet broken voice brought the sinner on his knees, as if God's own hand had smitten him with sudden death.

Hours passed away, and the grey light of dawn saw husband and wife yet kneeling as in morning prayer. Mercy and forgiveness are the attributes of the Eternal, and, like an effluence from his Spirit, may be breathed from one human heart to another, destroying both grief and guilt. Remorse had long preyed upon its victim, but now he was delivered up to penitence. Evil found now no abiding-place in his spirit; and after many sudden visits—many ghost-like hauntings and midnight knockings at its gate, forsook it for ever—leaving but a salutary and monitory dread of its return. In a few months the summer flowers were again bright in the garden, and clustering round the porch; and before the summer was gone, as the family, in decent apparel, walked duly every Sabbath to church, the neighbours had almost entirely forgotten how grievously one had erred, and all had been afflicted. But it was on the Sabbath-day that the penitential man most remembered all his sins; and in its blessed freedom from worldly cares, he then communed with his own heart, and knew that it had been desperately wicked. His son's face was a perpetual memento of his guilt, but one that he loved to look on; and the beauty of returning health on that other face which, in its most deadly wanness, never had upbraided him, reminded him, almost every time it smiled, of the long-continued cruelty that had nearly brought it to the dust. But contrition settled down within his heart; for he felt as if he had finally made his peace with God, and that the past ought to be remembered only for sake of the future.—*Janus.*

SIMPLE HABITS OF LIFE.

A manufacturer of Paisley, after a long life of severe toil, and little indulgence in the comforts of life, was suddenly enriched at last by the death of a relative in the West Indies, who bequeathed him the bulk of his fortune. The old man was soon afterwards at Edinburgh, where he happened to be introduced to the celebrated Lord Monboddo, to whom, at the same time, the story of his late acquisition of fortune was related. "Then," said Monboddo, contemplating the spare figure of his new acquaintance, "you ought to live generously: you and your wife should begin to take a glass or two of wine, and otherwise improve your diet a little." "Ay, auld man," said the Paisley weaver, evidently thinking the advice completely anticipated by the alteration he had already effected in his system of domestic economy, "we tak parritch and sweet milk to our supper."

The elder Sir William Forbes, banker in Edinburgh, and a very polite man, was one afternoon leaving the bank, about four o'clock, with a plain country acquaintance, who had been doing business with him. "Good morning," said Sir William, in parting with this person. "Good mornin'!" cried the other in surprise; "I got my mornin' two hours syne."

THE ATTENDANTS OF A HIGHLAND CHIEF.

The Gille-coorse, or henchman, who closely attended the person of his chief, and stood behind him

at table; the Bladair, or spokesman; the Bard; the Piobaire, or piper; the Gille-piobaire, the piper's servant, who carried his instrument; the Gille-more, who carried the chief's broadsword; the Gille-cas-fluich, who carried him, when on foot, over the rivers; the Gille-comhstrathaim, who led his horse in rough and dangerous paths; the Gille-trusareis, or baggage-man; the Gille-ruthe, or running footman, was also an occasional attendant. Besides these, he was generally accompanied by several gentlemen, who were near relations; and a number of the commoners followed him, and partook of the cheer which was always provided by the person to whom a visit was paid. These large followings, or *tails*, occasioned an act of council to be passed, prohibiting the northern lairds from appearing at Edinburgh with so formidable and inconvenient a retinue. The tails of the Highland chiefs were, however, sufficiently imposing on occasion of his majesty's late visit to Dunedin.—*Logan's Scottish Gael.*

ARCHITECTURE OF THE HUMAN BODY.

I HAVE just had put into my hands an instructive and pleasingly written tract, in a pocket size, entitled "A Lecture illustrative of the Architecture of the Human Body, intended for the Rising Generation, by H. W. Dewhurst."

"Man is placed by an all-wise Providence at the head of the whole animal creation, who are made subservient to the gratification of his wants and necessities. In him we perceive a great chain of characters by which the Almighty has been pleased to distinguish him from the inferior classes of animals by whom he is daily more or less surrounded, and to whom he resembles in many points by their structure and functions. The most evident feature is, that man alone is intended to walk in the erect posture, an action no other creature is capable of performing; whilst the structure of the most perfectly formed monkey prevents the animal sustaining the upright position for any length of time without a great effort, or clinging to some external support.

The higher characteristics of man constitute his peculiarities. He possesses intelligence; and the prominent features of his mental powers are his *animal propensities*, by which he is placed on a par with the lower animals; thus enabling him to propagate and rear his offspring, and provide for their necessities—his *moral sentiments*, which govern his animal passions, and give him a sense of good and evil—lastly, his *intellectual faculties*, which stamp his importance and superiority, as composing the summit of the animal kingdom.

Let us philosophically examine the manner in which he is constructed, and we shall find that it is in perfect accordance with the most exact mechanical principles. Investigating the heart and the blood-vessels, through which the vital fluid circulates, it is proved to be a perfect hydraulic machine, the heart being a most powerful engine by which the blood is propelled to the extremest part of the body; the lungs constitute an inimitable pneumatic apparatus; the beautiful membranes and transparent humours of the eye, forming an admirable optical instrument; in the same manner are the ears constructed on the most accurate principles of acoustics.

What an animated being! how vigorous and powerful! what beautiful and complicated machinery forms the graceful column of man!—it being composed of bones, articulations or joints, arteries, and veins, clothed with muscles and integuments!—how duly balanced! how aptly contrived for his various movements! At the summit of this column the head appears, appointed to this high situation as containing the seat of sensation, the light of understanding, and the faculty of sight. In the cranium, or skull, is situated the brain, the *organ* of the immaterial principle. In the brain the mind takes up its residence: here she holds communication with all the material things around her; from the brain she issues her commands, through the agency of the nerves, and sensations are conveyed from all parts of the body to the brain. The brain being extremely tender and susceptible of injury, the slightest local compression disturbing its action, it was necessary that it should be well protected from external violence.

The skull will frequently bear the most surprising degree of mechanical force applied to it without suffering any injury. It is composed of eight bones united by dove-tailed lines or sutures; if it had consisted only of one bone, it could not have answered every purpose for the defence of the brain. The division of the cranium into so many bones enables it to grow much faster, and with greater facility. In the early foetal state, as the first and second month after we are created, that which afterwards becomes the strong bony case of the brain exists only as a tough flexible membrane.

In no other part of animals do we see a greater instance of mechanical advantage, or lever power, than in the *lower jaw*. The temporal and masseter muscles pull almost *directly* at right angles to the line of the jaw; while in most other cases, as in that of the deltoid muscle lifting the arm, the muscles act *obliquely*, and with intensity diminished in proportion to their obliquity: an object placed between the back teeth is compressed with the whole direct power of the strong muscles of the jaw. Hence the human jaw can crush a body that resists with great force. The *teeth* form

an extraordinary set of chisels and wedges for cutting and tearing food. They are covered with a hard substance called enamel; on this account the teeth of many of the larger animals were used in former times for the same purposes as we now use steel, from the quantity of earth it contains. A set of small teeth appear soon after birth, and serve the child until the sixth or seventh year; these, in the course of time, fall out, and are replaced by larger ones, which last during a considerable period of our life. The number of teeth is only completed when the man and woman are full grown, by four more, called wisdom teeth.

In order to facilitate the various movements of the head backward and forward, and in the act of nodding, looking upward and downward—to effect these extensive purposes, it moves as an articulated fulcrum, or prop, on which it can turn either backward or forward, up or down, horizontally to the right or to the left. The two first movements are effected by a hinge joint fitted to the *atlas*, or first bone of the neck, but limited by ligaments, in its movements backward and forward, to prevent suffocation. The horizontal motion is effected by a peculiar auxiliary, placed on the bone below the first vertebra. It is a process of bone resembling a tooth, which fits into a pivot of the bone above it, and serves as an axle for the head to turn, but only to a limited extent, the muscles on each side protecting it from danger.

The spine, or back bones, are a continuation of the vertebrae; its various uses and amazing powers can never be wholly investigated; yet the reflective man can perceive sufficient of the magnificent design to compel him to adore and venerate the superior excellence of his God!

The spine, in figure, resembles, in some degree, an *Italic*, and consists of twenty-four vertebrae, or bones, joined together by smooth rubbing surfaces, and connected to each other by very strong intervening cartilages, more correctly termed intervertebral substance, which is extremely pliable, allowing great motion to the bones, and preventing their separation from one another, which would be followed by a material injury to the spinal marrow, and consequently to the destruction of life. The spine is the centre pillar on the top of which the head is situated; its use is to contain a prolongation of the brain, called the *spinal marrow*, which is of the greatest importance to animal life: if it is injured in the slightest degree, immediate death, or a paralysis of the parts below the injured portion, are the consequences.

From the spinal marrow, the nerves supplying some of the principal organs in the chest, abdomen, and inferior extremities, receive their origin. The spine affords support to all the muscles of the trunk; the ribs are articulated into the vertebrae of the back.

There are twenty-four bones in the human spine, joined to each other by broad bases; in some parts these bases are shallower than in others, according as they are to serve more immediately either the purposes of flexibility or strength. In the back, where strength is most wanted, they are firmer than in the loins, where flexibility is necessary; and still firmer in the neck, where the erect posture is chiefly required. Each of these bones is perforated through the middle, and so placed over and under those next to it, as to form a close canal for the medullary substance. To prevent this passage from being disturbed on change of posture, by the vertebrae shifting over one another, these bones are supplied with cartilages, which, being elastic and yielding, allow of these motions without separation of the bones themselves.

I may mention a curious fact, but yet a truism, that we are taller in the morning when we rise from our bed, than when we retire to it—for this reason, the weight of the body compresses the cartilages between the bones of the spine, which are restored partly by their elasticity, and partly from the superincumbent weight being removed during the horizontal position we assume when at rest.

On the various joints of the bones much of their different effects depend. Each is mechanical, and resolvable by human reason. There are two principal sorts of joints; viz. *ball and socket*, and the *hinge-joint*; one or other is used according to the extent of motion required. At the knee (the most complicated in structure) a hinge answers the purpose of moving the leg backwards and forwards; at the hip, a ball and socket serve to co-operate with the motion of the leg, and to move the limb to the right or left in any required position. The shoulder-joint is a ball and socket; but the socket here is very shallow, with a cartilage round its margin, while the cup of the thigh bone is very concave, and formed of more solid materials. These differences agree with the situations of each of them, and the purposes they are separately to answer; for as the one is a principal instrument of motion, the shallowness of the socket, and the flexibility of the cartilage, form its motion; while in the thigh and leg, which are to support the body, firmness is likewise necessary, which has been conceived in the conformation of the joints connected with them. In all the joints of the body, the ends of the bones are covered with cartilage, to prevent injury by the friction of hard substances. The ball, or head of the thigh bone, is tipped, and the cup lined, with this yielding substance: and the hip joint is protected by it. Each joint is supplied with a fluid denominated by anatomists *synovia*, by butchers, *joint oil*, which prevents the dreadful effects of friction.

Having considered the joints on which animal mo-

tions depend, we may next contemplate the mechanism by which these motions are generated and supported. The muscles and their tendons are not only constitutionally endowed to generate and regulate motion, but also differently constructed for these purposes, according to the movement required and the instruments used.

Muscles in general are pairs (with one or two exceptions we find them single, as the circular muscle of the mouth, &c.); their number has been estimated at two hundred and eighty-nine; but as they are the same on both sides, this must be doubled, which makes five hundred and seventy-eight, an enumeration which is pretty nearly correct. All animal motion is effected by muscles. They are divided into two great classes, viz. the *voluntary* and *involuntary*; those under the influence of the *will*, as the muscles of the arm and leg, &c.; and those whose action is independent of the will, as the *heart*, &c. which is merely a hollow muscle for the purpose of receiving the blood, and propelling it by means of arteries to all part of the body. Each muscle has an antagonist muscle; viz. one that acts in a direction contrary to the other: one muscle throws the arm out, which is called the extensor; the other bends the arm, and is called the flexor; one muscle relaxes, while the other contracts. Nothing is satisfactorily known about muscular contraction: this physiological question is not decided. The muscles are supplied with nervous energy by means of white cords, called nerves, which arise from the brain and spinal marrow; we know nothing of the nature of this principle circulating in nerves; we can only witness its effects. That nervous energy is necessary to the healthy performance of the various functions of the body, there can be no doubt. Digestion, secretion, sight, hearing, smelling, tasting, &c. cannot be effected if the nerve of communication between their respective functions and the brain be divided.

The body is supported by the blood, which is circulated by means of tubes denominated arteries and veins; the former carrying it from, and the latter returning it to, the heart, which organ gives a motion to the arteries, synchronous with the heart itself, and extending to the extremest ramification in the body; this motion we denominate the pulse. Thus is man a complete piece of machinery, the whole of which is put into action by means of a power derived from the brain through the agency of its nerves. The vital fluid passes from the heart into the lungs in a state dangerous to the preservation of life, being loaded with carbon, which it gives off in these organs; on receiving a due proportion of oxygen from the atmosphere, the blood becomes purified, and fit for the support of animal life. It circulates from the heart of a bright scarlet colour, and returns again to this organ of a reddish black, united with a great quantity of carbon, which it has obtained in the course of its circulation, after it has performed the trifling offices of *secretion*, *nutrition*, and *vivification*, or the *preservation of life*; while the digestive organs perform their due offices; create the various secretions, and form new blood in lieu of that which is expended.

The blood in an adult human body has been estimated to circulate throughout the whole system in four hours, or about six times in the course of a single day. Its quantity has been estimated by Bartholine to be about twenty-four pounds, and Sir Charles Bell considers thirty-three pounds as the average proportion, but in my opinion its exact quantity can never be truly ascertained.

By means of the beautiful mechanism of the heart and lungs is the important function of the circulation of the blood accomplished; and there is no portion of physiological research which displays greater perfection of design, a more admirable and splendid contrivance, or more ingenious machinery, than is exhibited in the formation of the heart and its vessels. The exquisite construction of even the most minute organ, and the harmonious sympathy pervading the whole, are objects of wonder, and must ever excite the veneration and admiration of all who delight to search after and contemplate the more elaborate works and unerring operations of the great Author of Nature.

I have already stated that an animal body is supported by means of blood, which is carried from the heart by means of tubes called arteries, and circulated by these through all parts of the body, and conveyed back again to the heart by veins. The nutritious portions of the various kinds of food we daily swallow are converted into blood. After masticating our food, it mixes with the saliva of the mouth, and is conveyed in a pulpy state to the stomach; it is there acted upon by a juice secreted by glands within the coats of the stomach, called *gastric juice*, which converts the food into *chyle*; it then passes from the stomach in this state into the large intestine, called the *duodenum*, where the nutritive part becomes separated from the feculent, and is converted into *chyme*, a substance resembling milk, which enters into a large vessel called the *thoracic duct*, and passes upwards to its termination in a large vein near the neck, where it is converted into blood. This blood is not adapted for the nourishment of the body without passing through the lungs, where it is acted upon by the oxygen of the atmosphere, and becomes oxygenated, converted into *arterial blood*, in which state it nourishes the human body.

The organs of sense are the instruments by which we enjoy intercourse with the external world; and first, The organ of *vision*. In man and the higher orders

of animals, they are two in number, situated in cavities formed by certain bones of the cranium and face. They are furnished with muscles that move it in every direction, and surrounded by a very soft delicate species of fat, which protects them and yields to them in all of their movements. The eye is composed of a series of tunics, some of which are transparent, containing diaphanous humours, through which the rays of light are transmitted to the retina, and enables us to perceive objects around us. There are appendages, as the eyebrow, &c. whose offices are to preserve the eye from injury.

2. The organ of *hearing*, a most beautiful but complicated piece of mechanism, is divided into the external and internal ear, by the musculus tympani, or drum of the ear. The former is on the outside and well known, the latter is contained within the petrous process, or internal portion of the bone. The limits of this lecture, however, will not permit me to give even a concentrated description of this organ.

3. The organ of *smelling*. The seat of this sense is in the cavity of the nose, in which a delicate vascular membrane is distributed throughout its extent, and upon which the olfactory nerves are ramified in great numbers. Its office is the detection of fragrant and unpleasant odours, and to secrete a mucus for its defence.

4. The organ of *taste*. It would be waste of words to describe the form and situation of the tongue. Besides constituting the organ of taste, it presents a most interesting subject to the physiologist and pathologist, from the concern it has in the functions of mastication, deglutition, and articulation. Its bulk is composed of numerous muscles. It is covered by the continuation of the membrane of the mouth. At the tip, edges, and upper surface of this organ, there are numerous projecting processes, called papillae, and in these the sense of taste resides.

5. The organ or sense of *touch*. The whole external surface of the body is covered with a strong elastic integument, called the skin. Anatomists divide this into two layers, of which the internal is termed the true skin, while the external is called the scarf skin; a third layer can only be demonstrated in negroes, in which the colour is said to reside; this layer is called the *rete mucosum*: it also exists in Europeans, but it is difficult to demonstrate. The use of the skin is to afford protection and support to the organs beneath it, and to exercise a function necessary for our comfort, viz. the exhalation of a gas, the exudation of the perspirable matter.

HUMAN STRENGTH.

As an appropriate accompaniment to the foregoing article, we are tempted to present the following anecdotes of the power of the human frame, which we derive from a delightful volume, just published in the *Family Library*, by our countryman Sir David Brewster, entitled "Letters on Natural Magic." The feats which immediately follow relate to Thomas Topham, who exhibited about a century ago, being 31 years of age, and 5 feet 10 inches high:—

1. Having rubbed his fingers with coal-ashes to keep them from slipping, he rolled up a very strong and large pewter plate. 2. Having laid seven or eight short and strong pieces of tobacco pipe on the first and third finger, he broke them by the force of his middle finger. 3. He broke the bowl of a strong tobacco pipe placed between his first and third finger, by pressing his fingers together sideways. 4. Having thrust such another bowl under his garter, his legs being bent, he broke it to pieces by the tendons of his hams, without altering the bending of his leg. 5. He lifted with his teeth, and held in a horizontal position for a considerable time, a table six feet long, with half a hundred-weight hanging at the end of it. The feet of the table rested against his knees. 6. Holding in his right hand an iron kitchen-poker, three feet long and three inches round, he struck upon his bare left arm, between the elbow and the wrist, till he bent the poker nearly to a right angle. 7. Taking a similar poker, and holding the ends of it in his hands, and the middle against the back of his neck, he brought both ends of it together before him, and then pulled it almost straight again. This last feat was the most difficult, because the muscles which separate the arms horizontally from each other are not so strong as those which bring them together. 8. He broke a rope about two inches in circumference, which was partly wound about a cylinder four inches in diameter, having fastened the other end of it to straps that went over his shoulder. 9. Dr Desaguliers saw him lift a rolling-stone of about 800 lbs. weight, with his hands only, standing in a frame above it, and taking hold of a frame fastened to it. Hence Dr Desaguliers gives the following relative view of the strengths of individuals.

Strength of the weakest men . . .	125 lbs.
Strength of very strong men . . .	400
Strength of Topham . . .	800
The weight of Topham was about 200.	

One of the most remarkable and inexplicable experiments relative to the strength of the human frame, is that in which a heavy man is raised with the greatest facility, when he is lifted up the instant that his own lungs and those of the persons who raise him are inflated with air. This experiment was, I believe,

first shown in England a few years ago by Major H., who saw it performed in a large party at Venice, under the direction of an officer of the American navy. As Major H. performed it more than once in my presence, I shall describe as nearly as possible the method which he prescribed. The heaviest person in the party lies down upon two chairs, his legs being supported by the one and his back by the other. Four persons, one at each leg, and one at each shoulder, then try to raise him, and they find his dead weight to be very great, from the difficulty they experience in supporting him. When he is replaced in the chair, each of the four persons takes hold of the body as before, and the person to be lifted gives two signals by clapping his hands. At the first signal he himself and the four lifters begin to draw a long and full breath; and when the inhalation is completed or the lungs filled, the second signal is given for raising the person from the chair. To his own surprise and that of his bearers, he rises with the greatest facility, as if he were no heavier than a feather. On several occasions I have observed that when one of the bearers performs his part ill, by making the inhalation out of time, the part of the body which he tries to raise is left as it were behind. At Venice the experiment was performed in a much more imposing manner. The heaviest man in the party was raised and sustained upon the points of the fore-fingers of six persons. Major H. declared that the experiment would not succeed if the person lifted were placed upon a board, and the strength of the individuals applied to the board. He conceived it necessary that the bearers should communicate directly with the body to be raised. I have not had an opportunity of making any experiments relative to these curious facts; but whether the general effect is an illusion, or the result of known or of new principles, the subject merits a careful investigation.

HISTORICAL CONTRAST.

AMONG the prejudices which we should like to see swept away by the advance of enlightened feeling, is that *other kind of self-love* which consists in an intense appreciation of our own nation, to the exclusion of almost all respect for our brethren in the great family of mankind. It is time that the Briton were made aware of the existence of military prowess, learned accomplishment, and other good qualities, in countries beyond his own seas; and it would also be worth while to inform him of what some enlightened foreigners have said respecting us; by which, in learning that he and his fellow-countrymen are beheld occasionally with the same prejudiced feelings which he entertains regarding them, he would be induced to cast those ideas away from him, as quite unworthy and unjust; and, at the same time, perhaps, he might have his own real faults so strongly placed before his eyes, that he must needs be conscience-struck by them. A work containing the remarks of the most enlightened foreigners upon our country would be one of much use, and of very great interest.

We are not going to present any parallel between the British nation and its neighbours—although we may perhaps do so at another time. The two following passages from a very pleasing work, contain a contrast between the manners of Christian Europeans and Mohammedan Asiatics, in the eleventh and twelfth centuries. Remote as the period is, the reader will blush to think that there should have been so much more humanity under the crescent than the cross. The extracts are from the "History of the Knights of Malta," written for CONSTABLE'S MISCELLANY by the late amiable Mr Alexander Sutherland, of Edinburgh, a person of much literary merit, who died at the early age of thirty-seven, carrying with him the regrets of all who had had an opportunity of knowing the extent of his talents, and, what was even more conspicuous in him, his extraordinary worth in private life.

THE CONQUEST OF JERUSALEM BY THE CRUSADERS.

On the 7th of June 1099, the Christian army encamped before the city. Battle, desertion, and disease, had frightfully thinned its ranks; and of the seven hundred thousand fighting men who had marched in the plains of Bithynia, there remained, exclusive of the garrisons left in the conquered cities, scarcely twenty-two thousand fit for the field. The pious zeal of the crusaders, however, had survived all the vicissitudes of their long and toilsome march. When they beheld the hallowed city from afar, the vanguard uttered a shout, which, rolling backward on the line of march, was echoed by the whole host. The more devout manifested their rapture by kneeling down in the dust, and shedding tears of joy, and many bared their feet on approaching the sacred walls. The Counts of Flanders and Normandy pitched their tents to the northward of the city, near the church erected on the spot where Stephen the proto-martyr died. Godfrey and Tancred erected their standards on the first swell of Mount Calvary—and Raymond of Toulouse occupied a position to the south of Mount Zion. On the fifth day of the siege, the crusaders made a furious attack, and, amid a storm of arrows and fire-balls, burst the first barrier, and strove to surmount the walls by escalade. The want of engines to batter down the walls, and the necessity to scale them by assault, abortive; and the crosses were driven back with shame and slaughter to their camp. This defeat was followed by a grievous scarcity of provisions and water; and the excessive privations which this deficiency occasioned, overwhelmed the whole army with suffering and anguish. So extreme was the thirst of the soldiers, who vainly sought for water in the stony ravines that seamed the country, that they dug, near the camp, a trench, and pressed the damp clouds of their lips to moisture. On the 15th of July, the army again advanced to the assault. Through the exertions of Godfrey and Raymond, some Genoese mariners from Jaffa constructed two huge movable towers of timber, brought from Sicily, a place thirty miles distant, and rolled them with immense labour to the foot of the fortifications. Drawbridges were made to extend from the top of these turrets to the battlement; and when the sun

rose on the beleaguered city, they were seen crowded with chosen warriors, eager to grapple hand to hand with the Moslem foe. Raymond's tower was burned to ashes by the fire which the besieged hurled against it; but the Count Bouillon's fully answered the purpose for which it had been constructed. Armed as an eagle, he perched himself on its summit, and for a considerable time his bowmen alone maintained the battle. "But at the hour," says the chronicler, "when the Saviour of the world gave up the ghost, a warrior named Letoile, who fought in Godfrey's tower, leaped the first upon the ramparts. He was followed by Guicher—the Guicher who had vanquished a lion; Godfrey was the third, and all the other knights rushed on after their chief. Threading aside the bows and arrows, the Latin knights rode forth at sight of the enemy abandoned the walls, and ran into the city, whither the soldiers of Christ with loud shouts pursued them." At three in the afternoon, the standard of the Cross waved in triumph on the walls; and, after four hundred and sixty years of bondage, the Holy City passed from under the Mohammedan yoke.

Victory thus bravely won was tarnished by the ferocity of the conquerors. All who showed the smallest disposition to resist were hewn down; and for three whole days, promiscuous massacre and pillage prevailed. Ten thousand miserable beings, who had been promised quarter, were barbarously put to the sword; and infants even were butchered in the cradle, and at their mother's breast. In the court of the Mosque of Omar, a structure built on the site of the famous temple of Solomon, with thousands of fugitives piled as a sacrifice, the Latin knights rode forth at sight of the enemy abandoned the walls, and ran into the city, whither the soldiers of Christ with loud shouts pursued them." At three in the afternoon, the standard of the Cross waved in triumph on the walls; and, after four hundred and sixty years of bondage, the Holy City passed from under the Mohammedan yoke.

When the work of death was over, the chief crusaders, in accordance with the devout zeal which animated them, laid aside their arms, washed their bloody hands, and, barefooted and uncovered, traced in solemn procession to the Redeemer's tomb. The fierce warriors who had so recently abandoned themselves to the most revolting atrocities, were seen kissing with pious fervour the memorials of the sufferings of Him who had been the messenger of peace to man; and the Holy Sepulchre resounded with their triumphant anthems and repentant groans. In the height of their enthusiasm, they fell at Peter the Hermit's feet, praising God as glorified in his servant.

THE RE-CONQUEST OF JERUSALEM BY SALADIN.

The last days of the kingdom of Jerusalem now seemed to be fast closing. The king and the tower of his palace were in captivity—the manhood of the country had fallen under the swords of the Infidels—and the military orders were nearly extinct. It was under these disastrous circumstances that the few Hospitalers, still marshalled under their once victorious banner, assembled to elect a leader in the stead of the venerable knight who had received his death-wound in the battle of Tiberias. That dignity was no longer an object of competition, but set beside with care and peril, that the knights with difficulty prevailed on Ermenegard Daps, on whom their choice fell, to accept it, which he did, under the conviction that it remained only for himself and his brethren to seek an honourable death (1187). Saladin lost no time in following up his victory by new conquests. Many of the strongest places in the kingdom, drained of their garrisons, and filled with the rapidity with which he overran the country, threw open their gates, and, at length, anxious to smite the Christian power to the core, he laid siege to Jerusalem, which was defended only by a few thousand Christians, the chief of whom were followers of the Greek church, and of course hostile to the Latin supremacy. The queen, who awaited within the walls the ruin of her throne, offered to capitulate; but Saladin, knowing her inability to offer a protracted resistance, rejected the proposition, and declared, "If the city did not surrender, he would seal the ramparts, sword in hand, and avenge, by an indiscriminate massacre of the inhabitants, the Moslem blood shed by Godfrey of Bouillon. This answer rendered the Latins desperate, and they resolved to bury themselves under the ruins of their shattered battlements. Even the women, gathering courage from despair, took arms, and prepared themselves to share the death that awaited their men. Saladin sought to seek an honourable death, and every assault, that, at the end of fourteen days, the sultan was glad to sign the treaty which he had previously rejected. The terms were at once honourable to the garrison, and indicative of a rare humanity in the conqueror. The city was left undisputed, and the Christian nobles and soldiers were permitted to march out with their arms, and guaranteed a safe convoy to any town in which they might choose to seek refuge. The sultan, however, the Christian Greeks were allowed to remain unmolested; but such as were Latins by descent, were required to pay a ransom, the men ten, the women five, and the children two crowns of gold, and to remove to some other place. All persons who were unable to pay this ransom were detained as slaves.

Notwithstanding the element terms of this treaty, the last article of which allowed the pressed with severity of his vanquished religious associations gave it an aspect of refined cruelty to the unhappy Latins, who passed the last night they remained possessors of the city in lamentations and tears. Multitudes, carried away by a pious enthusiasm, which momentarily became stronger as the hour of their expulsion drew near, hastened to the Holy Sepulchre, and prostrated themselves in mournful humiliation before the altar, with a consoling prayer that did him honour, refrained from entering the city, though the gates were thrown open at sunrise, until these melancholy demonstrations were ended, and the last of the Latin Christians had bidden it a final farewell. The matrons carrying their infants, led the procession—after them came the men, bearing provisions for their journey, and such household relics as circumstances permitted them to remove;—and, lastly, came the queen, and the two infant princesses, her daughters, surrounded by the priest-hood, the common nobility, and the few military men who were still able to grasp a lance. It is said that several of the Christian ladies, whose lords were in captivity, uttered dolorous cries, and lifted up their hands in earnest supplication, when they beheld Saladin, as he stood watching their departure. The noble-minded Kurd, on being made acquainted with the cause of their grief, which one of them, daughter of a noble, herself had felt, and the same day, he was to be lightened only by the liberation of their natural protectors, humanely ordered such prisoners as they named to be set free, and dismissed the fair suppliants with several princely gifts. Nor did the generosity of the conqueror terminate with this chivalrous action. With that respect for valour and humanity which supremely distinguished him, he no sooner heard of the benevolent attention which the Hospitalers were in the habit of bestowing on the sick and wounded, than he granted ten of them permission to remain a year longer in Jerusalem to perform the cure of all the sufferers who had been confided to their care.

Thus, on the 2d of October 1187, at the distance of eighty-eight years from its conquest by the first crusaders, Jerusalem passed once more under the Mohammedan yoke. Saladin, ere he entered the subdued capital, caused the bells of the Christian temples to be broken and melted down, and the Patriarchal Church, which had originally been a magnificent mosque, built by the Caliph Omar, on the ruins of the famous Temple of Solomon, was carefully purified with rose-water, and again dedicated to Infidel rites. The great cross which surmounted the dome of this superb structure was also displaced by the sultan's orders, and, as a mark of degradation, dragged for two successive days through the fifth of the street, until the wars had lasted a century for the city that had been the object of so much pious zeal and so many sanguinary conflicts, nothing save fresh dishonour and a heavier chain.

EDINBURGH: Published, weekly, by W. and R. CHAMBERS, 19, Waterloo Place; ORR & SMITH, Paternoster-row, London; and GEORGE YOUNG, Dublin. Agent in Glasgow, JOHN MACLEOD, Argyle Street; and sold by all other Booksellers in Great Britain and Ireland.

Subscribers in town may have the paper left at their houses every Saturday morning, by giving their addresses at 19, Waterloo Place. Price of a quarter of twelve weeks, 1s. 6d.; of a half year of twenty-four weeks, 3s.; and of a year, 6s. 6d. In every case payable in advance.

From the Steam-Press of W. and R. CHAMBERS.

CHAMBERS' EDINBURGH JOURNAL

CONDUCTED BY WILLIAM AND ROBERT CHAMBERS, EDITORS OF "CHAMBERS'S HISTORICAL NEWSPAPER" AND "INFORMATION FOR THE PEOPLE."

No. 31. SATURDAY, SEPTEMBER 1, 1832. PRICE THREE HALFPENCE.

THE STRANGERS' NOOK.

IN country churchyards in Scotland, and perhaps in other countries also, there is always a corner near the gateway which is devoted to the reception of strangers, and is distinguished from the rest of the area by its total want of monuments. When you inquire of the passing peasant respecting this part of the burial-ground, he tells you that it is the corner for strangers, but never, of course, thinks that there is or can be any sentiment in the matter. To me, I must confess, this spot is always more interesting than any other, on account of the more extended scope which it gives to those feelings with which one surveys a churchyard. As you wander over the rest of the ground, you see humble memorials of humbler worth, mixed perhaps with the monuments of rank and wealth. But these tell always a definite tale. It is either the lord or the tenant of some of the neighbouring fields, or a trading burgher, or perhaps a clergyman; and there is an end of it. These men performed their parts on earth, like the generality of their fellows, and, after figuring for a space on the limited arena of the parish or the district, were here gathered to their fathers. But the graves of the strangers! what tales are told by every undistinguished heap—what eloquence in this utter absence of inscriptions!

There can be no doubt that the individuals who rest in this nook belonged, with hardly the possibility of an exception, to the humbler orders of the community. But who will say that the final sufferings and death of any individual whatsoever are without their pathos? To me, who have never been able to despise any fellow-creature upon general considerations, the silent expressive stories related by these little heaps possess an interest above all real eloquence. Here, we may suppose, rests the weary old man, to whom, after many bitter shifts, all bitterly disappointed, wandering and mendicancy had become a last trade. His snow-white head, which had suffered the inclemency of many winters, was here at last laid low for ever. Here also the homeless youth, who had trusted himself to the wide world in search of fortune, was arrested in his wanderings; and, whether his heart was as light and buoyant as his purse, or weighed down with many privations and disappointments, the end was the same—only in the one case a blight, in the other a bliss. The prodigal, who had wandered far, and fared still worse and worse, at length returning, was here cut short in his better purpose, far from those friends to whom he looked forward as a consolation for all his wretchedness. Perhaps, when stretched in mortal sickness in a homely lodging in the neighbouring village, where, though kindness was rendered, it was still the kindness of strangers, his mind wandered in repentant fondness to that mother whom he had parted with in scorn, but for whose hand to present his cup, and whose eye to melt him with its tenderness, he would now gladly give the miserable remains of his life. Perhaps he thought of a brother, also parted with in rage and distrust, but who, in their early years, had played with him, a fond and innocent child, over the summer leas, and to whom that recollection forgave every thing. No one of these friends to soothe the last moments of his wayward and unhappy life—scarcely even to hear of his death when it had taken place. Far from every remembered scene, every remembered face, he was doomed here to take his place amidst the noteless dead, and be as if he had never been. Perhaps one of these graves contains the shipwrecked mariner, hither transferred from the neighbouring beach. A cry was heard by night through the storm which dashed the waves upon the rocky coast: deliverance was impossible; and next morning, the only memorial of what had taken place was the lifeless body of a sailor stretched on the sand. No trace of name or kin, not even the name of the vessel was learned; but, no doubt, as the villagers would remark in conveying him to the Strangers' Nook, he left some heart to pine for his absence, some eyes to mourn for him, if his loss should ever be ascertained. There are few so desolate on earth as not to have one friend or associate. There must either be a wife to be widowed, or a child to be made an orphan, or a mother to suffer her own not less grievous bereavement. Perhaps the sole beloved object of some humble domestic circle, whose incomings and outgoings were ever pleasant, is here laid low, while neither can the bereaved learn aught of the fate and final resting-place of their favourite, nor can those who kindly, but without mourning, performed his last offices, reach their

ears with the intelligence, grateful even in its pain, of what had been done to his remains: here the energies which had battled with the waves in their hour of night, and the despair whose expression had been wasted upon the black tempest, are all stilled into rest, and forgotten. The storm is done; its work has been accomplished; and here lies the strange mariner, where no storms shall ever again trouble him.

Such are the imaginings which may arise in contemplating that neglected nook in our churchyards which is devoted to the reception of strangers. The other dead have all been laid down in their final beds by long trains of sorrowing friends. They rest in death in the midst of those beloved scenes which their infancy knew, and which were associated with every happiness, every triumph, every sorrow which befel them. The burns in which they had "paidlet" when they were children, run still in their shining beauty all around and about their last resting-place; the braes, over which they wandered hand and hand "to pull the gowans fine," still look down in all their summer pride upon the fold into which they have at last been gathered for eternity. But the homeless strangers!—they died far from every endeared scene. The hills were not here like those which they had known; the hills were different too. Instead of the circle of friends, whose anticipated grief tends so much to smooth the last bed of suffering man, the pillow of the homeless was arranged by strangers: they were carried to the burial-ground, not by a train of real mourners, anxious to express their respect and affection for the departed, but by a few individuals who, in so doing, complimented human nature in general, but not the individual. To the other graves there was also some one to resort afterwards, to lament the departure of those who lay below. The spot was always cherished and marked by at least one generation of kind ones; and, whether distinguished by a monument or not, it was always a greater or less space of time before the memory of the deceased entirely perished from its place. Still, as each holy day came round, and the living flocked to the house of prayer, there was always some one to send a kind eye aside towards that little mound, and be for a moment moved with a pensive feeling, as the heart recalled a departed parent, or child, or friend. But the graves of the strangers! all regard was shut out from them as soon as they were closed. The decent few who had affected mourning over them, had no sooner turned away than they were at once forgotten. That ceremony over, their kind had done with them for ever. And so, there they lie, distinguished from the rest only by the melancholy mark that they are themselves undistinguished from each other; no eye to weep over them now or hereafter, and no regard whatsoever to be paid to them till they stand forth with their fellow men at the Great and Final Day.

ANECDOTES OF THE SHEPHERD'S DOG.

MANY dogs have an ear for music, and cannot hear a shrill note without breaking into a corresponding howl. They are now for the most part excluded from churches; but at no very distant period it was common for them to attend their masters thither in the country parishes; and large bands being thus assembled, they did not scruple to interrupt the service by gambolling about the passages, snarling, fighting, and other indecorous behaviour. Some of them, too, whose aural nerves were nicely strung, while the psalms were singing, at those turns of the tune which peculiarly affected them, struck in with a howling that was apt to discompose the younger part of the congregation, and greatly scandalized others: so the intrusion of dogs has been at length prohibited. But the evil cannot be altogether prevented, for many will not stay behind their masters; if tied up, they gnaw the rope, and chains are not to be had for confining them. If they are shut up, why, ten to one, some article vanishes from the place where they are confined, or a child, with whom they are favourites, is determined to see how they are passing the time, and, opening the door, allows them to escape. But some of them are by far too cunning to permit themselves to be either tied or shut up. One old cur, in the parish of M—, knows the Sabbath as well as his master, and takes care to keep out of reach at a safe distance from the house all the morning. He watches the time when the family set out for church, and accompanies them. During the sermon and prayers he

lies quiet, but erects himself into a posture of attention and enjoyment when the singing commences. Placed directly before the precentor, he points his nose upwards, and waits till a high note is reached, when, being unable longer to restrain himself, he shuts his eyes, and joins with a shrill and prolonged howl. To a stranger, this accompaniment has an odd effect; but the congregation are well accustomed to it, and nobody is discomposed by it, or disturbs the venerable animal. An anecdote of a different kind, but equally exhibiting the sagacity of the colley, we have heard from the person who witnessed the circumstances.

In the winter of 1823, our informant D. took charge for a few days of the flock of his brother, who was ill. His brother's dog, a docile animal, was easily induced to attend and obey him, contrary to the habits of most of the same breed, who refuse to make themselves serviceable to any but their master. A severe snow-storm took place while D., who had been accustomed to a town life, was performing these novel duties. At such times, it is scarce necessary to remind any of our countrymen the snow drifts to great depths in one place, while in another the surface of the ground is scarcely covered. If the wind, for example, blows upon the north side of a hill, its force lifts the snow from the ground, drives it over the summit, and lodges it on the south side. On this south side, perhaps, is situated the round, or shelter, in which the flock is penned in severe winter weather during the night; but here, though they find protection from the blast, no food is to be had—and hence the necessity of removing them during the day to more favourable ground, where, by penetrating a smaller depth of snow, they may reach the herbage. This work of removing a whole flock is very tedious, as they have to form a track through the snow. To render it less difficult, the shepherd usually takes half a score of the strongest, and drives them in the direction he judges most easy; he then returns for the bulk of the flock, who, finding a road opened, form into a long line, and thus proceed to the place of feeding. In order still more to shorten the time which this necessarily occupies, D. was in the habit of taking the advanced guard under his own charge, and leaving the remainder to that of the dog, who seemed perfectly to understand what was expected of him, and brought on his drove with a steadiness and deliberation which showed him to appreciate fully the difficulties of the way. Sometimes, from the inequalities of the ground, D. was completely hid from view, and, from the strength of the sheep, and greater facility of pushing forward a small number, a long way in advance. On such occasions, the dog would leave his drove, and make his appearance on some elevated situation, whence he could command a view of D.'s motions. Here he sat for some time and watched them; then returned of his own accord to his charge. D. could account for this in no other way than by supposing the sagacious animal to be aware of his inexperience in the employment; that he considered himself in some degree as "his guide, his monitor, and friend;" and made these reconnoitring expeditions from an anxiety he had, lest some difficulty should occur that required his assistance. As soon as they had conducted the flocks to the place where they were to feed, and met to congratulate each other on the successful accomplishment of the task, he testified his satisfaction in a manner which comported with the character of so considerate an animal, not by leaping upon his master and loud barking, like foolish dogs that have no command over their feelings, but he approached, wagging his tail, poked his nose upon D.'s hand, and licked it, his eyes beaming all the while with the liveliest kindness. "Nor can I ever persuade myself," concluded our informant, "that his joy arose entirely from a consciousness of having performed his own duty well: he felt, I have no doubt, a load of anxiety on my account removed from his mind, and was glad beyond measure that no untoward event had fallen out between us. The friendship which then commenced has not been broken off; my faithful assistant still survives, and never fails to recognise me when we meet even after long intervals of absence."

THE COMING COMET.

OF all the bodies which constitute a part of the celestial system, comets are the most remarkable in their appearances, physical constitution, and orbits of motion. They form one of the three classes into which

astronomers have divided the radiant orbs which adorn the sky during the night. There are first those stars, which, from their immense distance, seem constantly to maintain the same situation, and are hence termed *fixed stars*; secondly, the planets, or wandering stars (as the term signifies), of which the earth forms one; and thirdly, comets, which in many respects display a striking difference from any of the two preceding classes. In the early ages, ere the light of true philosophy had disenchanted the mind of man from those superstitious chimeras in which he is always so prone to indulge, the stars were considered to have some mysterious influence over the "fate of men and nations." Such being the case with respect to these bodies, ever placid in their aspects, and regular in their appearances, it does not surprise us to find, that comets shooting down from the remote regions of space with inconceivable velocity, and suddenly presenting themselves under aspects the most uncommon and terrific, should have been looked upon with terror and dismay, and regarded by superstitious ignorance as visible demonstrations of the wrath, and harbingers of the vengeance, of offended deities. But it does not a little astonish us, that, at the present day, ideas no less absurd should be entertained respecting the comet which is to visit us in October of the present year. It is entertained by numbers upon the Continent (we cannot say that we have found a proselyte to the belief in this country), that the heavenly stranger is to come in contact with the earth, and dash it to pieces. What gives this fiction a sort of humorous character is, that some of their own journalists have announced the appalling event as certain; and they have done so with a coolness which would be admirable were it not ridiculous. This has called forth an Essay on Comets by the celebrated M. Arago, of the French Board of Longitude, in which he has not only shown the absurdity of entertaining such a notion, but also given a very able account of the philosophy of comets in general. The grand end of all philosophy is to minister to human comfort; and certainly if any thing can, this essay of M. Arago's will restore the wonted serenity to the minds of our mercurial neighbours. It appeared in the *Annuaire* for 1832 (a species of almanack published at Paris); and as a translation of it has been spoken of by scientific men in this country as a *desideratum*, we obtained one, by the kindness of a friend, which, however, appearing too long for the Journal, we have condensed and simplified it in the following manner:—

These bodies have received the name of comets (*coma* in Latin signifies hair), from the bearded appearance which they frequently exhibit. Independent of their orbits of motion, they have, in general, three distinguished characteristics. First, the luminous point in the centre, called the *nucleus*; second, the nebulosity, vapour, or shining aureola, surrounding the nucleus, which is called the *coma*—these united constitute the head of the comet; third, the brilliant trains, more or less long, which accompany most of the comets—these are called their tails. Every bearded star which the ancients perceived was termed by them a comet. Modern philosophers have still retained the name, although many of the stars so entitled have neither nebulosity nor tail. It is by the peculiarity of their motions that they are now, and more philosophically, distinguished from the planets. They pass through space in curves so extremely elongated as to be carried so far from the earth in some parts of their course, that they become invisible to it. The orbits of the planets are confined within a narrow zone, or to planes not greatly inclined to the ecliptic, while those of comets are inclined in all possible directions. When Herschel first discovered Uranus, the peculiarity of motion which it appeared to have, led philosophers to consider it a comet; but when its track was proved to be nearly circular, it was immediately ranked amongst the planets.

By some ancient philosophers, comets were believed to be only meteors engendered in our atmosphere. To the celebrated Tycho Brahe we are indebted for the first discovery that they are stars. It has since been proved that they revolve round the sun in obedience to regular laws, bearing an analogy to those observed by the planets, and that their orbits are ellipses, or ovals, much elongated. The sun always occupies one of the foci of the elliptic orbit of each comet. The top of the ellipsis, which is that point of its orbit nearest to the sun, is called the perihelion, and that most distant, the aphelion. Comets can only be seen from the earth when they are in the neighbourhood of their perihelion. Their paths during the time of their appearance differ very little from parabolas; and hence it is usual, on account of the facility of computation, to assume that they really move in parabolic curves. An ellipsis, or a parabola, can be travelled in two different directions—that is, from west to east, which is called direct, and is the track of the moon, the planets, and satellites; the other is from east to west, and is called retrograde. Comets move in either direction.

It is not by the physical circumstances of its size and splendour that astronomers are enabled to determine the identity of a comet with one of those which previously visited the system. As soon as one appears, its parabolic elements are computed, which are, the inclination and longitude of its node (or the point in which it cuts the plane of the earth's orbit), serving to determine the plane of the orbit; the longitude of the perihelion, which makes known the direction of the great axis of the orbit, or the situation of that

curve in its proper plane; and the perihelion distance, which frees from uncertainty the form of the parabola, for the focus necessarily coincides with the centre of the sun. In this way, the parabolic elements of a great number of comets have been computed. Now, it is by referring any new calculation to these tables that the fact of a comet's previous appearance and periodic revolution is ascertained. If it coincides with none of them, it is to be considered a new comet; but if it differs only a very little in its parabolic elements from another system of elements contained in the table, and belonging to a comet formerly perceived, then we can with great probability consider them as identically the same comet. There is no mathematical impossibility in two comets describing in space two curves equal and similarly placed, but hitherto, confidence in the probability has been justified by success. I shall now make application of these principles to the only three comets whose periods are at this time properly established.

The comet of 1759.—A comet having made its appearance in 1682, Halley determined its parabolic elements. These were found to correspond very nearly with those of two comets which had respectively appeared in 1531 and 1607. The lapse of time between each of these periods is about 75 years, and Halley, accordingly, concluded that the three orbits belonged to the same identical comet. After a vague estimate of the perturbations it must sustain from planetary attraction, he predicted its reappearance at the end of 1758, or the beginning of 1759. The verification of this prediction was likely to be the commencement of a new era in cometary astronomy; so, to convince the most incredulous, philosophers deemed it necessary to do away with the vagueness of the date assigned by Halley for its return. In his time it was impossible to determine with exactness the strength of the aberrations. This difficult problem Clairaut resolved. He found that, by the attraction of the planets, it would take 618 days more to return to the perihelion than in the preceding revolution. The passage ought, therefore, to have corresponded to the middle of April 1759; but Clairaut, aware that want of time had caused him to overlook some terms in his calculation, intimated that these might amount to 30 days, either more or less, in the 76 years. The event justified all his predictions, for the comet appeared, as had been foretold, and passed its perihelion on the 12th of March 1759. Its parabolic elements were a little altered from those of its former visit, and exactly agreed with Clairaut's calculations.

All doubt being now dissipated as to the periodical return of this luminary, it only remained to reckon the date of its next appearance. This was accomplished by M. Damoiseau, who has brought his approximations still nearer the truth than his predecessor. He has also accounted for the action of the planet Uranus, which was discovered subsequent to the time of Clairaut. The conclusion at which he arrived was this—"The interval between the passage of the comet to the perihelion in 1759, and the next passage through that point, will be 28,007 days, which, to reckon from 12th March 1759, the commencement of this period, answers to 16th November 1835." In three years, then, we may expect a visit from that comet which in 1456 passed so near to the earth, accompanied with a tail which flamed over 60 degrees of the heavens, and was shaped like a Turkish sabre. An object so striking and so terrific could not fail in a superstitious age to excite universal terror, and be regarded as portentous of the greatest calamities to mankind, if not of the final catastrophe which was to terminate the tragedy of time. At the period to which we refer, the Mahometan arms had been very successful. They had carried Constantinople, and overthrown the empire of the east, which in Christendom spread the panic still more. Accordingly, it is not to be wondered at when we find Pope Calixtus exorcising both the comet and the Turks. It is to be hoped, however, that on the ensuing visit his holiness will save himself the trouble of anathematizing the harmless luminary.

The next comet of importance was that discovered by Messier in 1770. Its elements of motion did not correspond with those of any hitherto observed. It was found, however, by Lexell, that it performed its revolution round the sun in 5½ years. This important discovery obviated one objection. With a revolution so quick, frequent opportunities would thus be afforded of observing it. But it seems to have shared the fate of the last Placid; it has never been seen since, though attentively sought for in the exact places where the elliptic orbit of Lexell points out its return. This singular disappearance has been accounted for by supposing that the influence of the planet Jupiter, near to which it approached, was so great as to change its orbit, and compel it to move in another ellipse. It is quite certain that such an influence could bring it within the range of our instruments in the first instance, and deprive us of it in the second; but were we to attempt to prove the fact, it would plunge us into abstruse calculations, which are not consistent with a paper of the present description.

The next comet is one of a very short period. It was discovered at Marseilles on 26th November 1818, by M. Pons. On the calculations being made, its elements were found to resemble those of a comet observed in 1805. Its periodicity was thus put beyond a doubt, and Encke of Berlin afterwards established, by incontestable calculations, that it took only 1200 days to travel the whole extent of its elliptic orbit. Why, it has been asked, since it returns to

its perihelion in so short a space, was it never observed prior to 1805? The only plausible answer is, that this comet is very small, and has so feeble a light as to be invisible to the naked eye. The short period of its revolution, however, has been incontrovertibly proved by its return in 1822, 1825, and 1829. It returned to its perihelion on the 4th of May 1832, but in an unfavourable position for observations. The astronomers of the Cape of Good Hope and New Holland will have had the best opportunity for exactly determining its course.

The Comet of 6½ years.—We have now come to that celebrated periodic comet which certain grave journalists inform us is to run a tilt with our own compact and solid globe, and which heavenly warfare is to terminate so disastrously for us. This comet was perceived at Johannesburg, on the 27th of February 1826, by M. Bield, and ten days afterwards at Marseilles, by M. Gambart. The latter computed its parabolic elements without loss of time, and he found, on inspecting the table already spoken of, that it had appeared before in 1805 and 1772, and hence was periodic. It was necessary from that time to go over the parabolic with the elliptic elements, to discover the duration of the comet's revolution, which the parabolic elements left wholly undetermined. Clausen and Gambart undertook this calculation, and both found, almost at the same time, that the new comet made an entire revolution round the sun in the space of something less than seven years. This curious result was adopted without dispute, for, by 1826, the antiquated notion was completely departed from, that the times of the revolutions should be necessarily very long. However, after the failure of 1770, it would have been hazardous to determine the day of the future appearance without every contingency being accurately calculated—all the derangements and sensible aberrations which would result from planetary attraction. This task was accomplished by M. Damoiseau, and the result was,

That the comet of 6½ years would cross the plane of the ecliptic, that is, the plane in which the earth moves, on the 29th of October 1832, before midnight.

The earth during its annual journey round the sun never swerves from the plane of the ecliptic; it is, therefore, only in that plane that any body can come in contact with it. Let us now inquire whether the point in which the comet will cross the plane of the ecliptic is near the curve described by the earth, because this condition is no less necessary than the preceding to the meeting of the two bodies. By the calculation it is ascertained that the passage of the comet through the plane of the ecliptic ought to take place a little within our orbit, and at a distance from that circle equal to 4½ terrestrial semi-diameters. This distance, already so trifling, would wholly disappear if submitted to the elements given by Damoiseau, the little variations of which it appears difficult to account for. Furthermore, let us take the distance of 4½ terrestrial semi-diameters as true, and allow that it agrees with the centre of the comet; then let us see if the dimensions of that star are large enough to make some of its parts encroach upon points of our orbit.

In the appearance of 1805, some observations made by the celebrated Olbers, of Bremen, gave for the length of the semi-diameter of the comet 5½ terrestrial semi-diameters; from this calculation, compared with the preceding, it is evident that, on the 29th October next, the nebulosity of the comet will comprise a portion of the earth's orbit.

There now remains only one question to solve, and it is an important one, viz. at the moment when the comet will be so near our orbit, that its nebulosity will encroach upon a part of it, where will the earth itself be situated?

I have already stated that the passage of the comet, near a certain point of the terrestrial orbit, would happen before midnight, on the 29th of October; but the earth will not arrive at the same point until the morning of the 30th November, which is more than a month after. It must now be recollected that the smallest rapidity of the earth in its orbit is 674 thousand leagues a-day, and a very simple calculation will prove that

THE COMET OF 6½ YEARS WILL BE ALWAYS, IN ITS APPEARANCE IN 1832, AT LEAST MORE THAN 20 MILLIONS OF LEAGUES FROM THE EARTH!

To ascertain the least distance of the earth from the comet in its future appearances, we must recommence the same operations. If, instead of passing in this year through the plane of the ecliptic on the 29th October, it should arrive there only on the morning of 30th November, it would undoubtedly mingle its atmosphere with ours, and perhaps also dash against us! But it must not be forgotten that an error of a month in the passage of the comet to its node is impossible. I also add, that in this discussion I have been solely occupied with the nebulosity, properly speaking, of the comet, for no trace of a tail has ever been observed attached to this star during any of its previous visits.

The reader is now in possession of all that can interest him concerning the route of the forthcoming comet. In our next article on comets, we shall pursue the subject farther, and give an account of the physical constitution of comets, as far as that is known.

I am aware that, notwithstanding the effort to simplify this description of the approaching comet, certain phrases are necessarily used which may render the article somewhat obscure. In one simple sentence, therefore, I may explain, that the earth which we inhabit travels on a regular road; that the comet, now about to appear, travels on a path which crosses the earth's road, and that it is known by calculation, that the comet will pass about a month before the earth comes up—hence there will be no collision, as some people have imagined.

GRETNA-GREEN.

It is hardly necessary to inform any British reader that Gretna-Green, or rather the village of Springfield, in the parish of Gretna, in Dumfriesshire, has long been celebrated in the annals of clandestine marriages. It happens that, while a marriage can be performed in Scotland without the least solemnity (nothing more being necessary than a mutual acknowledgement of the parties, before witnesses, that they take each other respectively for man and wife), no pair can be coupled in England without many previous ceremonies, besides a regular performance of the marriage-service in the church, or else in private by special licence, which is a luxury that only the wealthy can afford. Hence, when young people in England wish to marry without the consent of friends, they find it necessary to escape to Scotland; and as Gretna is the nearest part of the Scottish border to the bulk of England, it is generally resorted to; and there, of course, a regular matrimonial forge has been established. An account of the Gretna system was published some years ago in a provincial periodical, by Mr M'Diarmid, editor of the *Dumfries Courier*; and as it may well amuse a more extensive circle of readers than it has yet obtained, while the main features of the practice which it delineates can only communicate a wholesome disgust to the mind, we extract the greater part of it in this place:—

"If Gretna-Green marriages be not always the happiest in the end, they are at least by far the merriest at the time; and Miss Lydia Languish was partly in the right when she pettishly remarked, that there was no fun in a love affair at all that did not lead to a leap from a window into a lover's arms, a chase, a challenge, and, as a matter of course, a paragraph in the newspapers. Yet, mistake me not, gentle reader; I am no advocate for imprudent marriages, and have no great respect for your boarding-school misses, who devour novels until their heads are turned, and, with their feelings wound up to the highest pitch, are ready to fly into the arms of the first man they meet, merely because his address is easy, his face handsome, and his carriage *debonair*. Love, they say, must be caught at first sight, and yet I should doubt whether a courtship in which the eye is the sole arbiter is likely to lead to the happiest results. A good husband gained in this way would be as great a windfall as the highest prize in a state lottery; and for every rash and inconsiderate nymph who espouses a man of sterling sense, whose talents and industry more than compensate his lack of fortune and humble lineage, there are probably a hundred that throw themselves away upon dotes and dandies, who are generally too much in love with themselves to become permanent worshippers at any other shrine. On this principle, a cross maiden-aunt or an obdurate parent, who look exclusively to a union of interests, may often do the state signal service by checking the evils of which Dr Malthus is so much afraid. But are there no cases of a different character?—is there no bane of an opposite nature, to which Gretna-Green furnishes an antidote? Many a fraudulent creditor has found an asylum within the precincts of Holyrood; but honest, upright, though unfortunate men, have been glad to fly to the same sanctuary, as the only means of eschewing the fangs of a merciless creditor. A luckless Edinburgh wight of my acquaintance became bankrupt some fifteen years ago, and though he voluntarily surrendered his whole effects, one of his creditors remained inexorable. In this dilemma, he tried every means to bring the churl to reason, fondly hoping he would come round at last, and pass from his threat of attaching his person. But no. A messenger arrived with a caption in his pocket, rung the bell, and inquired if Mr W. Y. was at home. Mr Y., who opened the door himself, with great presence of mind desired the officer to walk in, and without even waiting to lift his hat, closed the door suddenly behind him, bolted down stairs as if the furies had been chasing him, made for Leith Street, turned first one corner, then another, till he arrived unharmed at the back of the Canongate, and then darted away at a speed he never either equalled or exerted before. The officer, too, was a good runner, but he had made a little lee-way in the first instance; and though he strained every nerve, and even, I believe, was the fleetest man of the two, the fugitive gained the strand before him. Though only a few feet intervened between them, the officer, thanks to the strand, knew well that he durst not touch a hair of my friend's head, no more than the witches could have dared to dock Maggy's tail had she gained the farther side of the running stream. In a word, the quarry had escaped—the bay-hound was at fault, and he whom it was sought to place in *durance vile* paused on the very margin of the strand; and panting and blowing, exclaimed in scarcely articulate accents:—'A good race, eh!—won by half a neck, eh!—but I beat, I beat—good day, Sir.'

Now, the goal of the lover, like the goal of the debtor, is frequently gained by speed of foot; the race in the one case being performed by bipeds, in the other by quadrupeds, who drag a vehicle of some kind at their heels. And though the pursued contrive to take the advantage at starting, the tables are sometimes well nigh turned, particularly if they have journeyed far from home; but the accommodating priests are neither far to seek nor ill to find, and when time presses, they discharge their duty with astonishing celerity. Should an enraged father, supposing the distance to be rather trifling, ride or drive his own horse, he has some chance of overtaking the lovers; but if he trusts to

postboys, he leans, alas! on a broken reed. The rascals have a spice of knight-errantry about them which enlists their sympathies in favour of the runaways; and though, with a brace of lovers deposited in the chaise, they rattle along with the speed of Jehu, yet, if called upon to marry, rather than expedite the happy pair's progress, they can play the French postilion in fine style, and make a terrible flourish with heel and whip, while they are purposely losing ground 'all the while.' The very horses seem to guess at the character of the persons they carry, and the time is frequently so accurately reckoned, that just as the marriage ceremony has been concluded, the pursuing party arrives at Springfield, steps out of his carriage, rushes into the inn, and perceives, with looks which it would baffle pen or pencil to pourtray, that all his exertions have been unavailing.

Thoughts and fancies such as these were passing rapidly through my mind on the 25th August 1824, as I was slowly travelling from Annan to Langholm, and nearing the celebrated village of Springfield. Our frugal meal was soon dispatched at the inn, and after divers questions put to the landlord, as well as to the tidy maiden who waited on us, touching the important business of marriage, it was mutually agreed that we should send our compliments to Mr Elliot, one of the priests, and invite him to join us in a glass of toddy. His reverence (I use the word in no offensive meaning), who very probably expected a job, was not slow in making his appearance; and indeed from the hints, whispers, and looks of the landlady, I am firmly persuaded that the belief was general, that I and my companion, if not the principals, were at least the *avant couriers* of a marriage party. But here they laboured under a great mistake; bigamy is not permitted in Britain, and even were it otherwise, neither of us, I suspect, had found the cares of the married life so light as to think playing the fool over again. Be this as it may, our courteous guest neither expressed nor looked disappointment. The cheerful glass circulated freely, and before we parted, he became complimentary, and more than once confessed that he was better pleased with the polite manner in which we had requested the favour of his company, than if he had been sent for professionally, and with the prospect of receiving a pretty handsome fee. The effect of liquor in opening and softening the human heart has been compared to the power of a lighted taper placed in an alabaster or any other vase; what at first seemed opaque and impenetrable, suddenly becomes clear and distinct, enabling the observer to look through and through an object, and scan correctly its internal configuration. And so I found it in the present instance. The man, who seemed naturally shy and taciturn, gradually became frank and communicative, and in the course of a pretty long sederunt, I gleaned from him the following facts and circumstances, which I now lay at the feet of the reader, in the hope, that when he is not better employed, they may serve to while away an idle half hour.

At what precise period the first runaway marriage was celebrated at the spot called Gretna-Green, cannot now be satisfactorily ascertained; but in common parlance the custom is said to have existed from time immemorial. Old Joseph Paisley, who died in 1814, at the advanced age of fourscore years, resided in his youth at Megg's-hill, a small farm situated betwixt Gretna and Springfield; and hence the name of Gretna-Green. But so far back as 1791, he abandoned Megg's-hill, and removed to Springfield as a more convenient spot; and though the popular name is still kept up, it is no longer geographically accurate. Though he generally went by the name of the Blacksmith, he knew nothing of the secrets of the anvil and the forge. On the contrary, he was bred a tobacco-nist, and continued to roll and liquor the seaman's quid until the trade he had followed merely as a by-job threw so surprisingly that he found he could subsist on it alone, and that, too, without taking a *stave from his bicker*. *Welding* or joining is a term well known in the smithy; and it is believed that it was the metaphorical application of this term that procured for Paisley the appellation of Blacksmith. Though neither avaricious nor cold-hearted, he was a rough, outspoken, eccentric fellow; drank like a fish, swore like a trooper, and, when once in his cups, forgot entirely the character he had assumed. Still he monopolised the whole trade, and only on one occasion was threatened with opposition; but he soon put an end to his rival's pretensions, by proposing a copartnership, in which the assistant, in addition to the hope of a lucrative succession, was allowed to pocket the whole profits accruing from the visits of pedestrian couples. On more than one occasion, he earned the handsome fee of a hundred guineas, in a briefer space than a barber requires to shave a country bumpkin; old Charles B., Lord Deerhurst, and one or two others, paid fully that sum; and though these were catches of rare occurrence, many of the inferior fees were so handsome, that the priest, had he been careful, might have lived merrily, and yet died in easy circumstances. But he liked his bottle too well for that, and the same remark will apply to his successors. What is easily come by goes as cheaply, and the trade of marrying, though not so hazardous, has this feature in common with the trade of smuggling, that there is seldom much money gained by it in the end.

At present there are two rival practitioners at Springfield, one of whom married the granddaughter of Paisley, and fell heir to his trade, in much the same way that some persons acquire the right of vending quack medicines. Still the other gets a good deal of custom;

and here, as in every thing else, competition has been favourable to the interests of the public. Though a bargain is generally made before-hand, a marriage-monger who had no rival to fear might fix his fee at any sum he pleased; and instances have occurred in which the parties complained that they had been too heavily taxed. Not long before my visit to Springfield, a young English clergyman, who had failed to procure his father's consent, arrived for the purpose of being married. The fee demanded was thirty guineas, a demand to which his reverence demurred, and at the same time stated, that though he married many a couple, his highest fee had never exceeded half-a-guinea. The clergyman, in fact, had not so much money about him, but it was agreed at last that he should pay L.10 in hand, and grant a promissory note for the balance; and the bill, which was certainly a curiosity of its kind, was regularly negotiated through a Carlisle bank, and as regularly retired at the time appointed. And here I must mention a circumstance which has not been provided for in the new bill regarding combinations of workmen, though it manifestly tends to augment the tax on irregular marriages. At Springfield there are two inns, as well as two priests, one of which each of the latter patronises exclusively. More than this, the house at which a lover arrives at Springfield depends entirely upon what inn he starts from at Carlisle. Though he may wish to give a preference, and issue positive orders on the subject, these orders are uniformly disobeyed. The post-boys will only stop at one house, and that for the best of all reasons, that the priest goes snacks with them, and knows full well the value of their patronage. Excepting in the case of sickness or absence, the priests never desert their colours; all the guests of the one house are married by Mr —; of the other by Mr Elliot; so that those who are most deeply concerned have very little to say in the business. In this way something like a monopoly still exists; and what is more strange still, not only the post-boy who drives a couple, but the whole of his brethren about the inn, are permitted to share in the profits of the day. The thing is viewed in the light of a windfall, and the proceeds placed in a sort of a fee-fund, to be afterwards shared in such proportions as the parties see fit. To what extent the priests are taxed, I could not with all my art learn, but I suspect the demands made on them are rather exorbitant, and that, if they saw any feasible plan, they would willingly rid themselves of a set of jackalls, who, unlike the animal who brings the lion his prey, neither wait till their master has feasted, nor are contented with a small share of the booty. Altogether, the marrying business must bring a large sum annually into Springfield. Indeed, an inhabitant confessed that it is 'the principal benefit and support of the place.' Upon an average, 300 couples are married in the year, and half-a-guinea is the lowest fee that is ever charged. But a trifle like that is only levied from poor and pedestrian couples, and persons even in the middle ranks of life are compelled to pay much more handsomely. In September last, one gentleman had given L.40; and, independently of the money that is spent in the inns, many hundreds annually must find their way into the pockets of the priests, and their concurrents, the post-boys. In its legal effect, the ceremony performed at Gretna-Green merely amounts to a confession before witnesses that certain parties are man and wife; and the reader is aware that little more is required to constitute a marriage in Scotland—a marriage which may be censured by church courts, but which is perfectly binding in regard to property and the rights of children. Still a formula has a wonderful value in the eyes of the fair; and the priests, I believe, read a considerable part of the English marriage-service, offer up a prayer, require the parties to join hands, sign a record, &c. &c. But on this part of their vocation they prudently observe a strict silence; for, although the law cannot reach them at present, they could scarcely hope to escape punishment, were they openly to assume the character of parsons. They also grant lines, of which the following is a literal copy:—*These are to certify to all whom it may concern, that — and — came before me, and declared themselves to be both single persons, and were lawfully married according to the way of the Church of England, and agreeably to the laws of the Kirk of Scotland. Given under my hand at Springfield, near Gretna-Green, this — day, &c. before these witnesses.* At my request, Mr Elliot produced the marriage-record, which, as a public document, is regularly kept, and which, to confess the truth, would require to be so, seeing that it is sometimes tendered as evidence in court. True, they cannot subpoena a witness from Scotland, but the priest is of course allowed his expenses, and this he himself remarked, 'when a man knows that he goes in a righteous cause, why should he be either unwilling or afraid?'

A stranger who had leisure to rusticate about Springfield, tipping with the priests, and pumping the crones and oracles of the village, might pick up many a queer story that would add to his stock of standing jokes, or peradventure eke out the well thumbed pages of the 'Encyclopædia of Wit;' but as my time did not admit of this, I can only relate one or two.

Not long ago, a gentleman who had settled somewhere in Scotland arrived at Springfield, and spent an hour or two in one of the inns, chiefly, I believe, from motives of curiosity. He was accompanied by his daughter, a very beautiful and interesting creature, though not more than seventeen or eighteen years of

age. Neither father nor daughter had ever crossed the Sark before, and they were both more than ordinarily curious to know every thing about Scotland and Scotch marriages. In particular, they expressed a wish to see the *Blacksmith*, not doubting that a true son of Vulcan, with a begrimed face and leathern apron, would pop in upon them, and demand their pleasure. But here they were speedily undeceived, and when Mr Elliot arrived, the gentleman endeavoured to be as witty as possible, stating among other things that he wished to introduce a young lady, that she might know both her man and the way back again. To this salutation Mr Elliot answered drily, that he had known as unlikely things come to pass; and in less than three or four months, the same young lady actually came before him, and was married to one of her father's ploughmen. In point of looks, the bridegroom and bride seemed formed for one another, and the jocular priest, who from the first recognised his old acquaintance, ventured to hint after dinner that surely Mr — would not be angry with his fair daughter for proving herself so apt a scholar, and profiting by the lesson he had himself taught. But, alas! the blow fell so heavily on the poor Cumbrian, that it at first threatened to break his heart, or unsettle his understanding. The lovely and light-hearted Beatrice was the apple of his eye—the stay and pride of his maturer years; and so far from wishing to match her with a common clown, there were few even of the better class of yeomen that he deemed worthy of aspiring to such an honour. In the course of time, however, the old man's wrath gradually gave way to better feelings; a farm was taken for his son-in-law, and stocked and ploughed nobody knew how; and if report may be credited, the praiseworthy conduct of both the young people is likely to lead to a complete and permanent reconciliation.

On another occasion, a middle-aged gentleman arrived from the south of England, and was united to a lady considerably his junior in years and appearance, and who, very unfortunately, happened to be the sister of his former wife. The veteran bridegroom was in high spirits, scattered his money very freely, and seemed so well satisfied with the accommodations of the place, that he was in no haste to retire from the scene of his second nuptials. At length, however, the carriage was ordered to the door; and just as the sun was sinking in the west, and, by the agency of the clouds that congregated around the falling monarch, intersecting the broad expanse of the Solway with many a beautiful zone of light, the happy pair bade adieu to Springfield, and with a degree of haste, not at all requisite in their situation, made the best of their way to merry England. Nor had they left the inn above an hour or so, when a second chaise and four drove up, and discharged a fresh cargo of lovers, younger, and fairer, and better matched, but neither so wealthy nor so prodigal as the first. And whom, reader, might the second pair be?—whom but a handsome, well-favoured youth, and the only daughter of the former bridegroom, who, in revenge for her father's frailty and folly, had yielded to the entreaties of an honest yeoman, who had wooed her long and loved her dearly. The spirited young lady had no objection whatever to a stepmother, but a stepmother and an aunt in the same person formed a species of relationship utterly irreconcilable with her notions of propriety; and as she was determined to change her residence at any rate, she thought it just as prudent to change her condition at the same time. On arriving at Carlisle, the father found a letter awaiting him at the inn, marked in haste, and revealing to him the secret of his daughter's elopement; and not doubting that the parties had gone on the same errand as himself, he immediately ordered fresh horses, and hurried back to Gretna-Green. The carriages, in fact, must have met on the road; but the night being dark, neither party was aware of the presence of the other; and though the Yorkshire proprietor reached Springfield before his daughter and her lover had departed, he was unfortunately a stage too late. Much and loudly he bragged and bullied, and fain would he have carried his daughter along with him; but the yeoman refused to part with his bride, and when the other threatened to disinherit his child, and proscribe her husband, he very coolly replied, that, 'as matters stood, the connection was none of the most respectable—that he knew the value of a good wife, though without a guinea or a friend to take her part—that in a moderate way he could do his own turn, as well as the purse-proud gentleman he was addressing—and that as to the rest, he would trust to Providence and his own industry.' 'Nobly spoken,' roared the exultant priest; 'and faith, let me tell you, Jonathan Oldbuck, if I had known you were after marrying your wife's sister, I would have rather thrust my fingers in the fire than welded metals of such an opposite nature. The lines are now your own property; but if you'll restore the bit of plain paper, I'll hand you over every note, and wash my hands of the whole business.' But to this condition the Yorkshireman demurred, and perceiving that matters could not be mended, he left the apartment and the village too, 'growling all the while like a Russian bear.'"

ITALIAN AND BRITISH CLIMATE.

Or where Campania's plain forsaken lies,
A weary waste expanded to the skies.—GOLDSMITH.

ROME, once the chief city in the world, and still commanding respect from its antiquity and the events connected with its history, stands in the midst of one of the most insalubrious plains in Italy, styled the *Cam-*

pagna di Roma. This circumstance is often alluded to in the old Roman writers; among others, by Livy and Cicero, the latter remarking that Romulus, in seeking a healthy spot, built his city in a region of pestilence; and again complaining that the Apian way was so lined with mausoleums and tombs, that little room was left for the habitations of living beings. In modern times, the marshy and pestilential character of the country around Rome has been greatly augmented, and is the dread of the traveller. Dr James Johnson, in his recent work, entitled "Change of Air, or Pursuit of Health," thus describes this fearful wilderness, across which so many of our English tourists proceed in search of the antique, and that ever-fleeting object—health.

"It is from the high mountains of Viterbo (says he) that we have the first glimpse of the wide-spread Campagna di Roma. The beautiful little lake of Vico lies under our feet, its sloping banks cultivated like a garden, but destitute of habitations, on account of the deadly malaria which no culture can annihilate. From this spot till we reach the desert, the features of poverty and wretchedness in the habitations themselves, as well as in every thing around them, grow rapidly more marked. We descend from Monte Rosi upon the Campagna, and at Baccano we are in the midst of it. If a stranger come upon the Campagna in this direction, unacquainted with the causes of its desolation, he would feel no other impression than that of crossing a very extensive heath of moorland, which was destined to pasturage, because not rich enough for agriculture. It is not more marshy than was Hounslow Heath at one time; and it is far more undulating in its surface, its soil being, generally speaking, dry and sandy. To the south of Rome, however, and in many parts of the valley of the Tiber, the ground is very marshy, and there is much stagnant water. But no human form meets the eye, except the gaunt figure of the herdsman, muffled up to the chin in his dark mantle, with his gun and his spear—his broad hat slouched over the ferocious and scowling countenance of a brigand! The buffalo which he guards is less repulsive than he. As for the shepherd, Arcadia forbid that I should attempt his description. The savage of the wigwam has health to recommend him. As we approach within ten or twelve miles of Rome, some specks of cultivation appear, and with them the dire effects of malaria on the human frame. According to Eustace, 'bloated bellies, distorted features, dark yellow complexions, livid eyes and lips; in short, all the symptoms of dropsy, jaundice, and ague, united in their persons.'"

To this testimony may be added that of Sir T. C. Morgan, who informs us that "whole villages (meaning, no doubt, their inhabitants) came from La Marca and Ravenna to the Campagna, during the winter and part of the summer. They assemble at daylight in the public squares of Rome for hire. They are a miserable looking people. We were assured that every year one in ten of these wretches dies of the fever; and those who escape carry the marks of the poison in their swollen and sallow countenances. Very few are able totally to throw off the disease, and repeated exposure to the malaria, in successive seasons, never fails to destroy them."

Some of my less informed readers may here ask, "but what is this *malaria*, which is so destructive in its nature?" Malaria signifies a pestilential air or vapour, produced by the decomposition of animal and vegetable substances, through the means of heat and moisture. This dreadful species of bad air is extricated from the marshy grounds, and even from the cracks in the dry scorched plains of Italy, to an extent of which we have no conception in this country. In Rome, and other cities where the pavement and foundations of the houses cover the ground, and where the high walls shelter the passenger from the infectious gales, the malaria is less felt and heeded; but let us turn to most of the country parts—to those regions where animal and vegetable matter are acted upon by the heat of the sun, we find it reigning triumphant. According to Dr Macculloch, "the fairest portions of this fair land are a prey to this invisible enemy; its fragrant breezes are poison; the dew of its summer evenings are death. The banks of its refreshing streams, its rich and flowing meadows, the borders of its glassy lakes, the luxuriant plains of its overflowing agriculture, the valleys where its aromatic shrubs regale the eye and perfume the air—these are the chosen seats of this plague, the throne of the malaria. Death here walks hand in hand with the sources of life, sparing none; the labourer reaps his harvest but to die, or he wanders amidst the luxuriance of vegetation and wealth, the ghost of man, a sufferer from his cradle to his impending grave; aged even in childhood, and laying down in misery that life which was but one of disease. He is even driven from some of the richest portions of this fertile yet unhappy country; and the traveller contemplates at a distance deserts, but deserts of vegetable wealth, which man dares not appropriate—or he dies."

So this is Italy, the land whose climate is supposed to be so exceedingly delightful, and which is flocked to by thousands for the restoration of vigour to their animal existence! Vain imagination! The climate of Italy is found, on examination, to be, on the whole, much less salubrious than that of Great Britain. It is allowed that sixty thousand persons fall a sacrifice to consumption every year in this island; but in France, and all along the shores of the Mediterranean, this terrible malady is no less fatal to human life. The warmth of Italy is in reality no protection to the

valetudinarian; for with the warmth there is a moisture, and this induces malaria, which is fully as destructive as consumption itself. The desired climate for those of consumptive habits is that which has at once warmth and dryness, without variability. But these three virtues are rarely to be found combined. It is an ascertained fact there is no part of Europe perfectly sheltered from the piercing winds of spring, or possessing uniform warmth and dryness, or, indeed, any thing approaching to it. Madeira comes nearest to perfection. Its winter is 20 degrees warmer than that of London, while its summer heat exceeds that of London by 7 degrees. It is also exempt from keen winds, and is not subject to great varieties of climate. Nevertheless, how little is observed to be effected by a visit to this apparently salubrious region, and how much more efficacious in most instances is the attention which home can only afford, or the influence of native air. In comparing our climate with those of different countries, and especially that of Italy, we find it exceedingly salubrious, and less injurious to human life than most others. Although occasionally intemperate and variable, it is certainly free from native pestilential vapours, and has nothing deadly in its character. We may every where traverse the land fearless of the consequences; and instead of being affected by the diseased herdsman, or brigand, scowling in his sickliness and villany upon us as we pass, are we not rejoiced in hearing the jocund laugh of the reaper, or in seeing the harmless shepherd boy driving his charge

"along the mountain side?"

SCOTLAND:

ITS TRADE, SHIPPING, AND POPULATION.

THE increase which has taken place in recent times in the trade and manufactures of Scotland has been more rapid and astonishing than is observable in any other part of Europe. Looking back to the year 1666, we find that the whole vessels belonging to the country amounted only to 137, carrying 5736 tons. Of this number, Glasgow had no more than 12, of a burden of from 12 to 150 tons. At the Union in 1707, the shipping of Scotland had risen to 215 vessels, carrying 14,485 tons. In 1760, the number of ships employed in the fisheries, and in foreign and coasting trade, amounted to 999, carrying 53,913 tons; and in 1800, the shipping amounted to the more respectable number of 2415, carrying 171,728 tons, and employing 14,820 men.

It appears, by a Parliamentary paper, that in 1828 the number of vessels belonging to Scotland under 100 tons was 2160, and the number above 100 tons 983—total 3143, the total amount of registered tonnage of which was 300,836. We thus find, that from the Union till 1828, the shipping of Scotland rose from 215 to 3143 vessels, being a multiplication of about 14½ times within the period of 121 years. By a table in the Parliamentary paper it appears that Aberdeen owns the greatest amount of tonnage of any port in Scotland. Its tonnage is 46,587, that of Greenock 37,786, Glasgow 36,220, Leith 26,107, and Dundee 24,227. But this does not give a certain idea of the comparative amount of traffic carried on at these ports, for they employ the shipping of one another, and freight the vessels of inferior ports. In 1755, the imports into Scotland, in round numbers, were £465,411, and the exports £535,576; in 1825, the imports had increased to £4,994,304, and the exports to £5,842,269.

Such has been the extent and value of the agricultural improvements of Scotland within the same period, that the country could now supply her whole population with food without importation of corn, while the exports of her manufactured goods pays for all foreign luxuries, and leaves a heavy balance in her favour. What is remarkable, Scotland both exports and imports nearly the same kind of grain, and, deducting the one from the other, it appears that she is annually indebted to England and Ireland for 120,000 quarters of barley, and 180,000 of oats, while, on the other hand, she sends these countries 60,000 quarters of wheat. There being from three to four millions of bushels of malt made yearly in Scotland, chiefly for the whisky distilleries, the great demand for barley is accounted for.

It was recently calculated by Sir John Sinclair that the whole amount of manufactures in Scotland will annually exceed in value £14,000,000 sterling, including the price of the raw materials. The value of the mineral productions, such as coal, lime, iron, lead, &c. he calculates at £1,597,653, 6s. 8d. The fisheries he reckons at £1,300,000, and the gross produce of land at £23,261,155, 10s. The rise in the amount of population in Scotland, though steadily progressive since the Union, has not kept pace with the increase of trade and manufactures; consequently, the present population must be much more wealthy than their predecessors a hundred and twenty years since. In 1700, the population of Scotland was 1,048,000, and in 1821 it was 2,093,000, having taken 121 years to double itself; but perhaps great allowance should be made for the emigration which has constantly been going on into England, and latterly America. In 1831, the population was 2,365,807.

I cannot close this sketch without mentioning it as a fact well worthy of remark, that the tonnage of vessels on the Clyde is nearly as much as that of all Ireland, the tonnage of which, during 1828, only amounted to 97,369 tons, not one-third of the total tonnage of Scotland; in fact, the tonnage of Aberdeen

is as great as that of Dublin and Belfast, the two principal Irish ports, put together. Were I asked to explain the reason for this extraordinary superiority, I would state that the whole is attributable to the comparative habits of the people. For a hundred and twenty, and, most of all, for the last sixty years, the Scotch have reflected deeply and wrought hard in every department of the arts of civilized life, and the result has naturally been those gratifying facts above narrated. The Irish, on the other hand, have not reflected with judgment, nor have they been at all industrious. Ever pursuing some wild theoretic vision, which, when realized, is to make them happy and great, and ever discussing some great party question, which keeps the mind in a state of constant abstraction, they invariably lose the substance for the shadow, and are never advancing a single step in improvement or real national wealth. If any thing could convince them of this dreadful folly and its results, it would be a dispassionate comparison betwixt the extent, the capabilities, the wealth, and the amount of population of their own beautiful island with those of Scotland, a country not nearly so much favoured by nature, and which is much more severely taxed for the support of the state. The time has been, it must be remarked, when Scotland was also afflicted with abstract questions; the seventeenth century was entirely lost in Scotland, on account of a battle about religion, similar in many respects to that now carried on in Ireland. But this was at length got over, and it is exactly from the date of the settlement of that great question that the country has done any good.

WATERING PLACES.

WITHIN the last few years the resort to watering places has become particularly fashionable among the middle classes of Scotland, while the discovery of salubrious springs in different quarters of the country, and the competition among their proprietors, have given rise to a number of pleasant places of summer recreation, suitable to the demands and taste of the people. As occasionally some difficulty exists at this season in making the selection of a summer watering place of the description I mention, I propose to offer a series of sketches useful for the guidance of families. The first place I may notice is

MOFFAT.

This pleasing village is situated on an eminence at the opening of the hilly country, near the junction of the Moffat and Annan streams, in the upper part of Annandale, Dumfriesshire. It is situated at the distance of fifty-two miles south-west from Edinburgh, and twenty-one north-east from Dumfries. The distance from Glasgow is fifty-five miles. Being environed with lofty hills, some of them finely clothed in plantations of considerable beauty, an air of comfort and seclusion is thereby conveyed to the place, favourable to its character. One principal street, looking from the gentle declivity on which the town stands, towards the south, constitutes the body of the place, and affords fine prospects of the vale beneath. This street is judiciously laid out, spacious, and well calculated to form an agreeable promenade both for inhabitants and strangers. Much of the town is new, and the whole has a neat, cleanly appearance. Among the buildings are two good inns, at one of which at least visitors may be accommodated with horses, gigs, cars, or post chaises, for recreation along the different rides and drives about the town, or for travelling. The Dumfries and Edinburgh royal mail-coach passes through Moffat daily. The town possesses upwards of fifty good lodging houses, whose private apartments may always be had on reasonable terms. The market is well supplied with provisions, including vegetables, fruits, &c. Goats' and asses' milk is also to be had; and as there are more than a hundred cows kept in the parish, butter, milk, and cream, are plentiful. Around Moffat are some neat villas, all of them adding more or less, by their shrubberies and small plantations, to the beauty of the scenery. The parish church is an ornamental structure in the place, and besides it, there are several dissenting chapels.

Moffat derives the whole of its celebrity from the excellence of its mineral waters, which are of the most salubrious character, and are considered fully more efficacious by those who have resorted to them, than those of Harrogate, Leamington, or Bath. In the administration of these waters to valetudinarians, great improvements, suitable to the refinement of the age, have been effected in recent times. Over the chief spring, or well, there has been erected a splendid pump-room, measuring 60 feet by 30, answering the purpose of a lounge and news-rooms. At the back of this structure there is a series of baths, fitted up on the plan of the new baths at Leamington, with a dressing-room and fire to each: and it is mentioned that the supply to the mineral or sulphureous water baths, is sufficient to accommodate bathers at any hour. Shower and vapour baths can likewise be had, and there is a sedan chair for the use of invalids. In the Bath gardens there is a fine bowling-green for the use of visitors.

The salubrious springs at Moffat are three in number, one of them being sulphureous, and two of them chalybeate—that is, having an impregnation of iron or steel. The sulphureous is distinctly styled Moffat Well, and has an odour resembling the water of Harrogate. Its taste is somewhat saline; it sparkles when poured into a glass, and requires, so quickly do some of its best particles evaporate, to be drank at the fountain. No closeness of cork will preserve it

in bottles. Another spring, called, from its rising at the base of the Hartfell mountain, the Hartfell Spa, is a chalybeate, pretty strong at all times, but most so after heavy rains. A third spring, also chalybeate, is near Evan bridge, a little to the south of Moffat. Of a wine gallon taken from each of the three, the analyses made by the late Dr Garret, professor at Glasgow, afterwards lecturer to the Surrey Institution, were as follow:—

MOFFAT WELL.

"Muriate of soda (common salt),	36 grains,
Sulphuretted hydrogen gas,	10 cubic inches,
Azotic gas,	4 ditto,
Carbonic acid,	5 ditto.

"N. B.—This water will become useless if kept. Its efficacy has been proved in scorbutic and scrofulous cases.

HARTFELL SPA.

"Sulphate of iron (iron vitriol),	86 grains,
Sulphate of alumina,	12 ditto,
Azotic gas,	12 cubic inches.

"The water of this spring may be kept long without injury to its medicinal powers. It is a powerful tonic, of proved utility in obstinate coughs, stomach complaints affecting the head, gouty sores disordering the internal system, disorders to which the fair sex are liable, internal ulcers, &c.

EVAN BRIDGE SPA.

"Oxide of iron,	2 grains,
Carbonic acid,	13 cubic inches.
Azotic gas,	2 ditto.

"This being a weaker chalybeate than the preceding, resembling, in fact, a good deal the Harrogate chalybeate, might, it is thought, although now much neglected, prove useful when the preceding would be of too astringent a nature."

Little could be added to this just account of the properties of the mineral waters of Moffat. Having been frequented for many years, the place is one of the most respectable and comfortable among those towns claiming the notice of persons who wish to spend a few weeks agreeably in the country. The society is generally select and pleasing, and if the restoration of health be sought, I do not know a watering place which would be more certain to fulfil the expectations of the valetudinarian. The fame of Moffat is now not confined to Scotland, but is considerably extended in England, and attracts many visitors from the south; and as it lies near the border, on the great north road by Carlisle and Dumfries, it is much better adapted for the visits and residence of the English, than any other watering place in Scotland.

LIBERIA—AMERICAN BLACK POPULATION.

A few weeks ago, I took occasion to say a few words regarding slavery in North America, and the subject has again been brought under my notice by some pamphlets sent to this country, purporting to be Reports of the Pennsylvania Colonisation Society, and of the American Society for Colonising the Free People of Colour. Until I had perused these interesting papers, I was not aware of the great degree of exertion which is at present in operation on the other side of the Atlantic towards the removal of the black population to a land and climate more congenial with their nature and habits than the American continent. "Slavery (we are told in the introduction to one of the reports), and its inconsistency with the dictates of Christianity, have long been freely acknowledged and deeply lamented by the people of the United States, and its removal, the great problem which has occupied the attention of her best and wisest men. So far back as 1693, the Assembly of Pennsylvania, to put an end to the introduction of slaves, laid a duty of L.10 per head upon their importation; but this benevolent law, together with about fifty of similar tenor, which were passed by the neighbouring colonies up to the period of their revolution, were all refused the sanction of the mother country. The introduction of slaves was one of the great causes of complaint which led to their declaration of independence, dated July 4, 1776. Scarcely (continues the writer) had that struggle ceased, when a colony on the coast of Africa, similar to that of Liberia, was proposed, but the prosecution of the slave trade, by every civilized power, defeated these benevolent views. In 1796, the plan was again revived in a series of luminous essays by Gerard J. Hopkins, a distinguished Friend in Baltimore; and shortly afterwards, the legislature of Virginia, a state containing nearly one-third of the black population of the Union, pledged its faith to give up all their slaves, provided the United States could obtain a proper asylum for them. President Jefferson negotiated in vain for a territory either in Africa or Brazil; but that great state renewed its pledge in 1816, by a vote of 190 to 9 (most of the members being slave-holders), upon which, General C. F. Mercer, the Wilberforce of the American Congress, opened a correspondence with the philanthropists of the different states, which led to the formation of the American Colonisation Society on the 1st of January 1817. The great objects of that society were—the final and entire abolition of slavery, providing for the best interests of the blacks, by establishing them in independence upon the coast of Africa; thus constituting them the protectors of the unfortunate natives against the ravages of the slave, and seeking through them to spread the lights of civilization and Christianity among the many millions who inhabit those dark regions."

About ten years have elapsed since this association commenced its operations, which have as yet been attended with perfect success. A tract of land was purchased on the coast of Guinea from the aborigines of the soil, south from the free colony of Sierra Leone, from about latitude 5 to 7, and the chief entrepôt for the reception of emigrants settled at Cape Mesurado, between latitude 6 and 7. "Five years of preliminary operations (says Elliot Cresson, in a speech before the society) were requisite for surveying the coast—providing the natives—and selecting the most eligible sites; numerous agents were subsequently employed—ships chartered—the forests cleared—schools, factories, hospitals, churches, government buildings, and dwellings erected, and the many expenses requisite here defrayed; and yet, for every fifty dollars expended by our society from its commencement, we have not only a settler to show, but an ample and fertile territory in reserve, where our future emigrants may sit under their own vines and fig-trees, with none to make them afraid. During the last year (1830), an amount nearly equal to the united expenditures in effecting these objects has been exported by the colonists; and from Philadelphia alone, eleven vessels have sailed, three of them chartered through the efforts of the Pennsylvania society, and bearing to the land of their forefathers a large number of slaves, manumitted by the benevolence of their late owners."

The colony of free blacks thus planted in Liberia, as it is called, already numbers about 2000 citizens, managed by themselves on republican principles, under a governor appointed by the society. The soil is fertile, and the climate congenial to their constitutions. The colonists have established relations of friendship and trade with the native chiefs, more than a hundred of whose children have been sent to Liberia for instruction in the schools established there. Each individual has thirty acres of land bestowed upon him, and in one year the settlers have shipped upwards of seventy thousand dollars' worth of produce. The colony now possesses a newspaper, conducted of course by a black editor, and which, having seen in London, I can vouch for the respectability of its tone and appearance. The import and export trade of the colony is annually improving, and already there are regular traders betwixt it and some of the American ports. The capital of the territory is called Monrovia, a neat town built on a neck of land betwixt the Atlantic and the estuary of the Mesurado river, and therefore well adapted for trade.

When we are informed that there are two millions of slaves, and three hundred thousand free blacks in the United States, which, jointly, have an annual increase of about sixty-six thousand, and that it costs L.7, 10s. to remove a single individual to Liberia, and place him in a way of supporting himself, the foregoing plan of free colonisation appears almost hopeless and desperate. It is impossible for us to see how any thing like an impression can be made on the immense mass of negroism in the United States. It may be very true that Great Britain has expended, in twenty-four years, L.8,000,000 sterling on Sierra Leone—a sum which would colonise the whole coloured population of the Union; but America has not the wealth of this country, and could not indulge in so expensive a freak. It therefore appears, that, as the colonisation societies are supported only by voluntary contributions—and I may here mention, that donations from Britain will be most thankfully acknowledged—the amount of deportation to Africa must continue on a most inefficient footing, as respects the clearing out the whole black population. This, however, is the gloomy side of the picture. We are all well acquainted with the effects of an incessant drop of water, which will wear the hardest rock; and it may be predicted, that an unflinching perseverance in this truly noble cause will eventually work results which human reason cannot now properly foresee. Besides, even although the exportation of the blacks, with their own consent, could not, by any accessible means, be effected, a very great object would be gained, simply by the planting of a civilized negro race on the shores of Guinea. Hitherto the vast continent in the interior has been impervious to the inroads of Christianity, commerce, or any of the ordinary means of civilization, chiefly from the destructiveness of the climate on the lives of white men. By the establishment in Guinea of a nation of blacks, trained in all the varied pursuits and religion of the whites, a grand obstacle is overcome, and I sincerely pray that that light which the American Colonisation Society has kindled on the coast of Africa, and which is growing brighter and brighter, may be the proximate means of illuminating the benighted millions of human beings who inhabit that extensive continent, and of causing them to stand up disenthralled, emancipated, and regenerated.

THE ESQUIMAUX.

THE Esquimaux constitute a most widely-diffused race, occupying all the shores of the Northern Ocean, and embracing nearly the entire circuit of the globe. Richardson and Franklin found them along the whole coast of the American polar sea; Kotzebue, in the channel near Behring's Straits. The Samoides and Kamtchadales, in Northern Asia, seem to belong to the same family. A similarity of visage and figure, boats, huts, and instruments—even a resemblance in habits, character, and mode of life—might have been produced by the common pressure of the same very peculiar outward circumstances. The affinity of

speech, however, which is such as proves the dialects of all the Esquimaux to be mere varieties of one common language, affords a clear proof that an original race from some one quarter has spread over the whole range of those immense and desolate shores. This migration must have been facilitated by the vast continuity of coast which stretches along the Arctic Ocean, and which is not equalled in any other quarter. Hence, probably, the Esquimaux, at distant ages, connected the old and new continents, which, at all other points, were then wholly unknown to each other.

The external form of that people seems influenced, and, as it were, characterised, by the severity of the climate. Their stature is decidedly lower than that of the Europeans; five feet nine inches being considered, even in a man, as almost gigantic. Though the trunk of the body is somewhat thick, all the extremities are small, especially the hands and feet, and the fingers short. The face is broad and flat, the nose small, and, at the same time, so sunk and deep, that in some instances a ruler could be applied from cheek to cheek without touching it. It is somewhere observed, that their visage presents that peculiar form which the human face naturally assumes under exposure to intense cold, that all the projecting features are drawn in, and the cheeks, consequently, pushed out. In the same way, exposure to the weather may perhaps produce the high cheek-bones of mountaineers. Under these modifications, however, both their bodies and their limbs are very tolerably shaped. Even the female countenance, though without pretensions to regular beauty, is often agreeable, with a frank and good-humoured expression; so that, were it cleared of the thick crust of grease and dirt, so as to exhibit the real complexion, which is only that of a deep brunette, it might, even in Europe, be reckoned handsome. The skin is unctuous, and unpleasantly cold to the touch; the flesh soft and flabby, owing, probably, to the fat animal substances which form the principal part of their food.

In their moral qualities, the Esquimaux, or at least this particular tribe, present much that is worthy of commendation. At the first opening of the intercourse, the most undeviating honesty marked all their conduct, though this quality, in the course of two winters' communication, was considerably undermined. They were exposed, indeed, to most severe temptations, by seeing constantly scattered about the ships, little planks, pieces of old iron, and empty tin pots, which was to them as if the decks had been strewn with gold and jewels. It also came to their knowledge that, in some of their early exchanges, rich skins had been bartered for beads, and other trifles of no real value—a system against which they exclaimed as absolute robbery. From first to last, the virtue now mentioned was practised among themselves in a manner worthy of the golden age. Their dresses, sledges, and all their implements of hunting and fishing, were left exposed inside or outside of the huts, without any instance being known of their having been carried off. Property, without the aid of laws or tribunals, was in the most perfect security. The common right to the products of the chase marks also a singular union, without seeming to relax their diligence in search of food, though it may perhaps contribute to their very thoughtless consumption of it. The navigators admit that they were received with the most cordial hospitality into the little huts, where the best meat was set before them, and the women vied with each other in the attentions of cooking, and drying and mending their clothes. "The women working and singing, their husbands quietly mending their lines, the children playing before the door, and the pot boiling over the blaze of a cheerful lamp," gave a pleasing picture of savage life. Yet a continued intercourse showed that the Esquimaux inherited their full share of human frailty. Begging we shall pass over, though in many instances persevering and incessant, because it seems to have been called forth almost entirely by their connexion with our countrymen, and by too lavish presents at the first; while their little bursts of envy appear to have flowed from the same source. But the fair Esquimaux are charged with strong propensity to slander and detraction, which were as busy among them as they sat in circles round the door mending their lines, as in the most fashionable drawing-rooms. Their own conduct, meantime, is said to have afforded the most ample scope for censure, especially in regard to conjugal fidelity; and yet, when it is admitted that these faults were carefully concealed, and much outward decorum observed, and that the propensity to calumny often led the natives beyond the strict limits of truth, we doubt whether too implicit reliance may not have been placed on the scandalous chronicle of the frozen regions. The natives certainly do appear to display a peculiar apathy in regard to the sufferings and even the death of neighbours and relations. Widows, and the aged and infirm, if they have not children of their own, experience the greatest indifference. In times of plenty, indeed, they share in the general abundance of food; but, during scarcity, a very small quantity reaches them, and, receiving no attendance in their sickness, they often perish through pure want and neglect. The children are treated with extreme tenderness; though the practice of adoption, which prevails most extensively, and which establishes in full force, between the parties, the ties of father and child, is practised with regard to boys only, and seemingly with the view that they may contribute to support the old age of their fictitious parents.

The religious ideas of the Esquimaux, though they cannot be dignified with any better name than superstition, are not much more absurd than the popular creed of the ancient Greeks and Romans. Their principal deity is Aywillagoo, a female, immensely tall, with only the left eye, wearing a pigtail reaching to her knee, so thick that it can scarcely be grasped by both hands. Captain Lyon witnessed a mighty incantation, in which Zoolamak, the chief magician, summoned Aywillagoo to the upper world to utter her oracles. The party were assembled in a hut, where light after light was put out, till they were left in total darkness. Zoolamak then, after loud invocations, professed to descend to the world below to bring up the goddess. Soon there rose a loud chant of peculiar sound, imagined to be the voice of Aywillagoo. During half an hour, in reply to the loud screams and questions of her votaries, she uttered dubious and mystical responses; after which, the sound died away, and she was supposed to descend beneath the earth, when Zoolamak, with a shout, announced his own return to the upper world. The magician, however, being soon after on board a British ship, was treated with nine glasses of hot water (brandy), under the influence of which he began to act over again his enchantments, when it appeared, that by varying modes of applying the hand or jacket to the mouth, he produced those changeful sounds which had passed for the words of Aywillagoo. This divinity has for her father a giant with one arm. The Esquimaux pantheon comprises, moreover, Pamioli, a spirit frequently invoked, and a large bear, whose dwelling is in the middle of the ice, and who frequently holds converse with mankind. The natives believe also in a future world, the employments and pleasures of which, according to the usual creed of savage races, are all sensual. The soul descends beneath the earth through successive abodes, the first of which has somewhat of the nature of purgatory; but the good spirits, passing through it, find the other mansions successively improve, till they reach that of perfect bliss, far beneath, where the sun never sets, and where, by the side of large lakes, that never freeze, the deer roam in vast herds, and the seal and walrus abound in the waters.—*Murray's Polar Seas and Regions, in Edinburgh Cabinet Library.*

HISTORICAL SKETCH OF THE STOCKING MANUFACTURE.

"It is well known that the Romans and other ancient nations had no particular clothing for the legs. During the middle ages, however, hose or leggins, made of cloth, began to be used; and, at a later period, the art of knitting stockings was discovered. Unluckily, nothing certain is known as to the individual by whom, the place where, or the time when, this important invention was made. Howell, in his *History of the World*, says, that Henry the Eighth were none but cloth hose, except there came from Spain, by great chance, a pair of silk stockings; that Sir Thomas Gresham, the famous merchant, presented Edward the Sixth with a pair of long silk stockings from Spain, and that the present was much taken notice of; and he adds, that Queen Elizabeth was presented, in the third year of her reign, with a pair of black knit silk stockings, and that from that time she ceased to wear cloth hose. It would appear, from this circumstantial account, that the art of knitting stockings, or at least that the first specimens of knit stockings, had been introduced into England from Spain, about the middle of the sixteenth century; and such seems to have been the general opinion, till an allusion to the practice of knitting, in the pretended poems of Rowley, forged by Chatterton, caused the subject to be more strictly investigated. The result of this investigation showed clearly that the practice of knitting was well known in England, and had been referred to in acts of Parliament, a good many years previously to the period mentioned by Howell. But it had then, most probably, been applied only to the manufacture of woollen stockings, and the general use of cloth hose shows that even these had not been numerous. There is no evidence to show whether the art is native to England, or has been imported.

It is a singular fact that the stocking frame, which, even in its rudest form, is a very complex and ingenious machine, that could not be discovered accidentally, but must have been the result of deep combination and profound sagacity, should have been discovered so early as 1589, before, in fact, the business of knitting was generally introduced. The inventor of this admirable machine was Mr William Lee of Woodborough, in Nottinghamshire. He attempted to set up an establishment at Calverton, near Nottingham, for the manufacture of stockings, but met with no success. In this situation, he applied to the Queen (Elizabeth) for assistance; but, instead of meeting with that remuneration to which his genius and invention so well entitled him, he was discouraged and discountenanced! It need not, therefore, excite surprise that Lee accepted the invitation of Henry the Fourth of France, who, having heard of the invention, promised him a magnificent reward if he would carry it to France. Henry kept his word, and Lee introduced the stocking frame at Rouen with distinguished success; but after the assassination of the king, the concern got into difficulties, and Lee died in poverty at Paris. A knowledge of the machine was brought back from France to England by some of the workmen who had emigrated with Lee, and who established themselves

in Nottinghamshire, which still continues the principal seat of the manufacture.

During the first century after the invention of the stocking-frame, few improvements were made upon it, and two men were usually employed to work one frame. But in the course of last century the machine was very greatly improved. The late ingenious Mr Jedediah Strutt of Derby was the first individual who succeeded in adapting it to the manufacture of *ribbed* stockings. Estimating the population of Great Britain at 16,000,000, and the average annual expenditure of each individual upon stockings and knit gloves at 5s., the total value of the manufacture will be £4,000,000. Of this sum, the value of the silk and cotton stockings and gloves may amount to £2,500,000."

The foregoing statements have been extracted from the Dictionary of Commerce by J. R. McCulloch, who quotes from Beckmann's *History of Inventions*. We may now be permitted to say a word relative to the manufacture of stockings in Scotland. Although it appears that the stocking frame came into use in England about the beginning of the seventeenth century, and most likely soon banished the use of the knitting wires, the effect of this invention was very late in being seen in Scotland. Till far on in the eighteenth century, the use of knitted stockings was universal. Mittens, or woollen gloves for the hands, and boot-hose for drawing over the legs in riding, were also quite common, and all were wrought by the hand. The manufacture was carried on solely by women, the wives and daughters of farmers chiefly, and the produce was sold as the means of bringing in a small revenue. In Aberdeenshire, the females of mostly all ranks carried on the knitting of stockings to a considerable extent, not only for home, but for foreign consumption. The introduction of the stocking frame to Hawick in 1771, and the change of manners which took place about this period, soon ruined this lucrative traffic, but still the greater part of the stockings worn by people in the country on ordinary occasions are knitted at home, of white or coloured wool. The art is also still in use in Shetland, where knitting forms almost the only amusement to relieve the tedium of a long winter, and where the articles produced are exceedingly fine in the texture.

LONDON PORTER.

It has been generally believed that the superiority of London porter is caused by its being made of Thames water. This is a very erroneous opinion. The Thames water, from its impurity, has been long abandoned by the London porter brewers, who use either New River water or hard water, I believe, chiefly the latter. London is built on fine sand and gravel, and about two hundred feet below the foundation of the city there is a stratum of clay and a stratum of chalk, and here is found a most abundant supply of water, which is lifted by pumps. Hence, the superiority by no means lies in the water used, but in the immense quantity made, and in the art of the manufacturer. It is a very remarkable fact, that, except at Dublin, this beverage has never yet been equalled in point of strength and flavour. Good porter, of the most refreshing quality, is now sold all over the metropolitan districts. Imitations have been tried, with great exertion and outlay of capital, in different parts of the country, but they can all be detected by their *burnt taste*, and bear no comparison to the rich, full body of the genuine London porter. This generous liquor, as is well known, is always drunk out of pewter or silver pots, which impart a finer flavour to the mouth of the drinker than if glass or earthenware were used. The reason for this can be scientifically accounted for, by the electro-chemical action which is going on betwixt the acid of the porter and the metal; and, therefore, the popular taste is quite correct in adhering to pewter pots. The Scotch, who import London porter to a large extent, do not seem to be aware of this remarkable fact, as they always drink the liquor from glass tumblers. Between six and seven millions of barrels of porter or strong beer are made annually in England; in 1830, the quantity exported was 74,902 barrels.

EDINBURGH ALE.

While London bears the palm of superiority in the art of porter-brewing, Edinburgh challenges all the world to compete with it in the manufacture of ale. In the making of this luxurious beverage, it has, for a considerable period of years, had no rival, unless we allow, what is perhaps correct, that the brewers of Leith, Prestonpans, and Linlithgow, and some other small towns, are equally entitled to hold up the superiority of their liquors; nevertheless, the whole fall under the designation of Edinburgh ale. This ale differs entirely, in body, flavour, appearance, and character, from the English ales. It is as clear as amber, and of the same colour; soft and delicious in taste; so strong, that a few glasses produce a slight intoxication, or inclination to sleep; and has a thin creamy top. It is exceedingly difficult to keep, and is easily affected by atmospheric phenomena, although kept in casks in a close cellar, and generally turns hard or sourish after being kept more than a season. It is always used in Edinburgh in glass quart bottles—never in draught; and, when diluted with water, forms an agreeable table beer. It has been occasionally alleged, from the intoxicating qualities of Edinburgh ale, that it is mixed with *cocculus indicus*, or some other poisonous ingredient; but this is, without doubt, an idle fallacy, the liquor being simply the

strength of malt and hops. It is used only in moderate quantities, being quaffed from long tapering glasses made for the purpose, and cannot be indulged in so freely as porter, to which it bears no other resemblance than it is made from nearly the same materials, differently prepared. The quantity of strong beer or ale made in Scotland annually amounts to about 110,000 barrels, upwards of 3000 of which are exported; the chief export being to London. About 130,000 barrels of table beer are also annually manufactured, besides an immense quantity of small beer—a species of light, cheap, frothy liquid, in great domestic request in Scotland, and which, from its resemblance, in some respects, to ginger beer, might be manufactured in the English towns with every chance of success.

FORMATION OF SCOTTISH SOCIETY.

(Continued.)

In our last article on this subject it was correctly shown, however painfully to Scottish feeling, that the various families of the Cumyns, the Baliols, the Bruces, the Stewarts, and the Wallaces, were all descended from English settlers in Scotland. In continuing the catalogue of distinguished names who assisted in forming Scottish society, the next to be mentioned is that of *Douglas*. This once exceedingly powerful and haughty family draws its origin from no higher source than the blood of a Flemish emigrant, Theobaldo Flamatico, as he was named in the charters, appeared in this country about 1150, and, as a vassal of the Abbot of Kelso, received a grant of some lands on Douglas water, in Clydesdale; and his descendants, as was customary, took a surname from their estate. *Dhu-glas* signifies the dark blue stream. It has been of late warmly contested that the Douglasses had a much higher foreign extraction; but we have seen no document to prove that such was actually the case, while their Flemish origin seems incontestably fixed by the chartulary of Kelso. The family did not make any particular figure in history till the eventful epoch of the wars of Bruce, when it became conspicuous for its adherence to the interests of that monarch. It was raised to an earldom by David the Second in 1357, but before this period the chiefs of the family went occasionally by the name of the Lords of Douglas.

There are now a number of respectable families in Scotland with the name of *Menzies*. This name is a corruption of the ancient English surname of *Manners* or *Meyners*, having originally been such. The first of the race who settled in this part of the island was Anketil de Meyners, who witnessed a charter of William de Vetrepoint to the monks of Holyrood at the beginning of the thirteenth century. This person is understood to have been a younger son of the English family of Meyners, and he was probably the father of Robert de Meyners, who flourished under Alexander the Second, and was appointed chamberlain on the accession of Alexander the Third. Subsequently the family acquired lands in Perthshire, where their descendants are still found under the appellation of *Menzies*.

The *Hamillons* also draw their origin from Anglo-Norman settlers of the same early period. Roger and William, two younger sons (says George Chalmers) of Robert, the third Earl of Leicester, and the grandson of Robert, the first earl, who came over with the Conqueror, went to Scotland in the reign of William the Lion, to whom they were related by his mother, the Countess Ada. Roger became Chancellor and Bishop of St Andrews, and William married, and, acquiring a large estate, founded the family which afterwards rose to ducal honours. The surname, *De Hambleton*, was assumed by William, from the manor where he was born, in Buckinghamshire.

Families with the surname of Boswell deduce their origin from a branch of the English family of Bosville, who settled in Scotland under David the First, and soon spread into different quarters of the country. It is impossible to trace any connection betwixt this name and that of St Boswell's, a village in the south of Scotland, for it is ascertained that this place took its name from one Boisil, a monk of Melrose who lived many centuries before the Bosvilles arrived in the country. The family of *Charteris* of Amisfield, and other families of the same name, were likewise Anglo-Norman settlers of David's reign. The *Burnetts* are of the same Anglo-Norman lineage, being all descended from Robert Burnard, who settled in Teviotdale as early as 1128, and was the first of the name in North Britain. The *Edmunds* of Mid-Lothian, now extinct, and their place only remembered by the name of Edmondston, an estate near Edinburgh, were also from an Anglo-Norman stock of the same period. The *Ferrarses*, another extinct Mid-Lothian family, were a branch of the English race of Ferrars. The *De Burnvilles*, also extinct, but probably continued under the name of Burn or Burns, were also settlers under David the First. One of them held the lands of Brocsmouth in East Lothian under William the Lion. One of the most distinguished foreign settlers of William's reign was Helias, the son of Hutred, who obtained from Waldeve, the son of Gospatrick, the lands of Dundas in West Lothian. Helias, on his settling on these lands, assumed the appellation as his own surname, and hence the origin of the family of *Dundas*—a name associated with the history of the country for six centuries, and known both for good and evil up even till our own times. The *Mowbrays* likewise settled at this period, and also the *Gourlays* in the year 1174.

The first of the latter family was Inglegram de Gourlay, who obtained some lands in Fife, and became the progenitor of the Gourlays of Kincairg. Another family of the Gourlays settled in Lothian, as vassals of the Earls of Dunbar. The *Mortimers* appeared in the country at the same time, and one of them, receiving the lands of Moncrieff in Perthshire, assumed that title as his surname, and became the progenitor of the families named *Moncrieff*.—*To be continued.*

COUNTERPART ANECDOTES.

THE following remarks on the English language are from a recent work, entitled, "Mirabeau's Letters during his Residence in England." They are introduced here chiefly for the sake of the anecdote at the end, to which we are surprised to find that we can furnish an exact counterpart:—

"But what is particularly vexatious is, that, having learned English tolerably well with your eyes, it is very possible that your ear may not comprehend a syllable. Not only I do not know a language the orthography of which agrees less with its pronunciation, but I know of none the pronunciation of which is so difficult, so capricious, so uncertain. One would feel inclined to believe that the writing and the pronunciation of this language are separated by a lapse of many centuries. 'You write *bread*,' said Madame Denis, Voltaire's niece, to her English master—'you pronounce *bred*: why don't you simply say *du pain*?'"

A French teacher, lately resident at Edinburgh, but now practising his profession, in which he is very eminent, at Glasgow, one evening gave a *petit souper* to some of his friends in the Scottish metropolis. Among those present was a simple-hearted honest Scotch matron, whose claims to be of the party arose, we believe, from her having some children under Mr F——'s charge. During supper, she heard a great deal of French talked, which afflicted her with strong surprise. "It was sic a daft-like language," she thought, "whan ae heard it yattered away that gate. And, dear sake, Mr F——," she added, taking up a slice of a loaf, "just let me ask what ye ca' this, in that queer language o' yours?"

"Pain, madame," answered the polite Frenchman. "Peng!" she cried; "sic a like word! Dear me, Mr F——, wad it no be far wiser like, and mair to the purpose, just to ca' it *breede*?"

The good lady little thought how her wit was jumping with that of a more distinguished person.

DECLIVITY OF RIVERS.

A very slight declivity suffices to give the running motion to water. Three inches per mile, in a smooth straight channel, gives a velocity of about three miles an hour. The Ganges, which gathers the waters of the Himalaya mountains, the loftiest in the world, is, at eighteen hundred miles from its mouth, only eight hundred feet above the level of the sea—that is, about twice the height of St Paul's Church in London [or the height of Arthur's Seat, near Edinburgh], and to fall these eight hundred feet, in its long course, the water requires more than a month. The great river Magdalena, in South America, running for a thousand miles between two ridges of the Andes, falls only five hundred feet in all that distance. Above the commencement of the thousand miles, it is seen descending in rapids and cataracts from the mountains. The gigantic Rio de la Plata has so gentle a descent to the ocean, that in Paraguay, fifteen hundred miles from its mouth, large ships are seen, which have sailed against the current all the way, by the force of the wind alone: that is to say, which, on the beautifully inclined plane of the stream, have been gradually lifted by the soft wind, and even against the current, to an elevation greater than that of our loftiest spires. —*Arnott's Physics.*

THE LONG NAILS OF THE PACHA.

When Mahomet Ali, the illustrious restorer of civilization to Egypt, first sent out his army, modelled after the European fashion, to attack the Wahabees in the interior, every where they marched they were looked upon with pity, both by the natives and by the outposts of the enemy. Instead of being mounted on richly caparisoned horses, loaded with all the finery of the Osmanlees, and armed with a scymitar, the men marched on foot quietly in files, dressed in coarse red jackets, and all the arms they appeared to possess was a musket with a *long nail* at the end of it. On coming up and forming a position on a plain in front of the Wahabees, the latter considered that these poor wretches had delivered themselves up for slaughter; rushing down the hills, therefore, with the usual impetuosity of Turkish cavalry, and with the intention of surrounding the Egyptians, they were dreadfully staggered in their career by receiving a well-directed fire from the lines. Surprised and daunted by the shower of balls which fell among them, and emptied scores of saddles at every volley, they were obliged to retreat in quick time, pursued by the grenadiers and light companies, who hunted them through their fastnesses, at every step letting them feel the use of the *long nails* on the muskets, until they retired into an inner part of the country. When the news of this first engagement of his new troops reached Mahomet Ali, he bounded from his divan with joy; and ever since, the dread of the close rank and file, and, above all, the *bayonet*, has favoured every military movement of the Pacha.

Column for Clever Little Boys.

ARITHMETICAL AMUSEMENTS.

Cocker and Dilworth, Walkingham and Vyse, in their own sphere by BIDDER were outdone; They, or with pen or pencil problems solved,—He, with no aid, but with his memory! They, when of years mature, acquired their fame,—He, "lisp'd in numbers, for the numbers came."

Oh, how I do love to see a clever little boy; none of your dull dunderheads, who never stir from the bottom of their class, and who, when you ask them to do any little job, don't know what you mean, or require to be told twice before they move; none of these stupid fellows for me: show me a smart active boy of industrious and honest habits, a boy who is never at a loss for his lesson, and who will run or jump in a moment to execute what you want done without grumbling, or pretending there are difficulties in the way; nay, who will even know how to be of service to his father, or his elder brothers, or may be his uncle, without constant telling. Oh, how I do love to see such a smart and ingenious serviceable boy. These are the sort of boys who are to be great men when they grow up; these are the boys who are to take the lead in future society. I don't care for boys who cannot count; that is, those who have no knowledge of arithmetic. I have observed that it is of no use for boys to be clever if they do not properly understand the value of figures or numbers. They are liable to imposition on all hands, and may even be cheated by the woman who sells the berries at the corner. I would advise all boys to try what they can to be good counters. Some will arrive at much greater perfection in this art than others; still it is astonishing how expert any boy may become, simply by diligence and attention to his slate. I know there are thousands and thousands of boys, both in England and Scotland, who read the JOURNAL every Saturday when it comes out, and that many of them are quite expert at figures, besides being excellent scholars in other respects. I therefore wish to give these clever little chaps an afternoon's amusement with their pencil. For this purpose, I beg to lay before them the following observations on arithmetic and arithmetical games, selected from that valuable juvenile manual, "THE BOY'S OWN BOOK."

"The delightful and valuable science of arithmetic (says the author) first arrived at any degree of perfection in Europe, among the Greeks, who made use of the letters of the alphabet to express their numbers. A similar mode was followed by the Romans, who, besides characters for each rank of classes, introduced others for five, fifty, and five hundred, which are still used for chapters of books, and some other purposes. The common arithmetic, in which the ten Arabic figures, 1, 2, 3, 4, 5, 6, 7, 8, 9, 0, are used, was unknown to the Greeks and Romans, and came into Europe, by way of Spain, from the Arabians, who are said to have received it from the Indians. It is supposed to have taken its origin from the ten fingers of the hand, which were made use of in computation, before arithmetic was brought into an art.

The Indians are very expert at computing without pen or ink; and the natives of Peru, in South America, who do all by the arrangement of grains of maize, excel the European, with the aid of all his rules and implements for writing. But the dexterity of those people cannot for a moment be compared with the feats of mental arithmetic exhibited by George Bidder. This astonishing boy at a very early age, and without education, was capable of solving very intricate questions in arithmetic, without the use of pen, pencil, or writing implements of any sort, but entirely in his own mind, as correctly and quickly as the most expert person could in the common way. We have, personally, witnessed his ability in this respect, and among many other complicated questions which were put to him, we recollect the following:—Supposing the sun to be 95 millions of miles from the earth, and that it were possible for an insect, whose pace should be $7\frac{1}{2}$ inches per minute, to travel that space, how long would it take to reach the sun? This he mentally solved in a very short time.

Several other mental arithmeticians have appeared within these few years. Among the rest, Jedediah Buxton, an illiterate peasant, who was never taught to read or write, appears to have been eminent. Several of the questions answered by this man have been recorded; among others, we recollect the following:—How many times will a coach-wheel, whose circumference is six yards, turn in going 204 miles? In thirteen minutes Buxton answered—59,840 times. Then he was asked:—And, supposing sound travels at the rate of 1142 feet per second, how long will it be before the report of a cannon is heard 5 miles off? His answer was—23 seconds, 7 thirds, and 46 remain. On being required to multiply 456 by 378, he gave the product in a very short time; and, when requested to work the question audibly, so that his method might be known, he multiplied by 456 first by 5, which produced 2280; this he again multiplied by 20, and found the product 45,600, which was the multiplicand multiplied by 100; this product he again multiplied by 3, which produced 136,800, the product of the multiplicand by 300; it remained, therefore, to multiply this by 78, which he effected by multiplying 2280 (or the product of the multiplicand multiplied by 5), by 15, as 5 times 15 are 75. This product, being 34,200 he added to 136,800, which was the multiplicand multiplied by 300, and this produced 171,000 which was 375 times 456. To complete his operation, therefore, he multiplied 456 by 3, which produced 1368, and, having added this number to 171,000, he

found the product of 456 multiplied by 378, to be 172,368. By this it appears that he was so little acquainted with the common rules, as to multiply 456 first by 5, and the product by 20, to find what sum it would produce, multiplied by 100; whereas, had he added two ciphers to the figures, he would have obtained the product at once.

TO TELL ANY NUMBER THOUGHT OF.

Desire any person to think of a number, say a certain number of shillings; tell him to borrow that sum of some one in the company, and add the number borrowed to the amount thought of. It will here be proper to name the person who lends him the shillings, and to beg the one who makes the calculation to do it with great care, as he may readily fall into an error, especially the first time. Then say to the person:—"I do not lend you, but give you ten, add them to the former sum." Continue in this manner:—"Give the half to the poor, and retain in your memory the other half." Then add—"Return to the gentleman, or lady, what you borrowed, and remember that the sum lent you was exactly equal to the number thought of." Ask the person if he knows exactly what remains: he will answer "Yes." You must then say—"And I know, also, the number that remains; it is equal to what I am going to conceal in my hand." Put into one of your hands 5 pieces of money, and desire the person to tell how many you have got. He will answer 5; upon which, open your hand, and show him the 5 pieces. You may then say—"I well knew that your result was 5; but if you had thought of a very large number, for example, two or three millions, the result would have been much greater, but my hand would not have held a number of pieces equal to the remainder." The person then supposing that the result of the calculation must be different, according to the difference of the number thought of, will imagine that it is necessary to know the last number in order to guess the result: but this idea is false; for, in the case which we have here supposed, whatever be the number thought of, the remainder must always be 5. The reason of this is as follows:—The sum, the half of which is given to the poor, is nothing else than twice the number thought of, plus 10; and when the poor have received their part, there remains only the number thought of, plus 5; but the number thought of is cut off when the sum borrowed is returned, and, consequently, there remain only 5.

It may be hence seen, that the result may be easily known, since it will be the half of the number given in the third part of the operation; for example, whatever be the number thought of, the remainder will be 36, or 25, according as 72 or 50 have been given. If this trick be performed several times successively, the number given in the third part of the operation must be always different; for if the result were several times the same, the deception might be discovered. When the five first parts of the calculation for obtaining a result are finished, it will be best not to name it at first, but to continue the operation, to render it more complex, by saying, for example, "Double the remainder, deduct two, add three, take the fourth part," &c.; and the different steps of the calculation may be kept in mind, in order to know how much the first result has been increased or diminished. This irregular process never fails to confound those who attempt to follow it.

THE MONEY GAME.

A person having in one hand a piece of gold, and in the other a piece of silver, you may tell in which hand he has the gold and in which the silver, by the following method:—Some value, represented by any even number, such as 8, must be assigned to the gold, and a value represented by an odd number, such as 3, must be assigned to the silver; after which, desire the person to multiply the number in the right hand by any even number whatever, such as 2; and that in the left by an odd number, as 3; then bid him add together the two products, and if the whole sum be odd, the gold will be in the right hand, and the silver in the left; if the sum be even, the contrary will be the case.

To conceal the artifice better, it will be sufficient to ask whether the sum of the two products can be halved without a remainder; for in that case the total will be even, and in the contrary case odd.

It may be readily seen, that the pieces, instead of being in the two hands of the same person, may be supposed to be in the hands of two persons, one of whom has the even number, or piece of gold, and the other the odd number, or piece of silver. The same operations may then be performed, in regard to these two persons, as are performed in regard to the two hands of the same person, calling the one privately the right, and the other the left.

THE GAME OF THE KING.

This game is an application of one of the methods employed to tell several numbers thought of, and ought to be performed in a company not exceeding nine, in order that it may be less complex. Desire any one of the company to take a ring, and put it on any joint of whatever finger he may think proper. The question then is, to tell what person has the ring, and on what hand, what finger, and on what joint.

For this purpose, you must call the first person 1, the second 2, the third 3, and so on. You must also denote the ten fingers of the two hands, by the following numbers of the natural progression, 1, 2, 3, 4, 5, &c. beginning at the thumb of the right hand, and ending at that of the left, that by this order the num-

ber of the finger may, at the same time, indicate the hand. In the last place, the joints must be denoted by 1, 2, 3, beginning at the points of the fingers.

To render the solution of this problem more explicit, let us suppose that the fourth person in the company has the ring on the sixth finger, that is to say, on the little finger of the left hand, and on the second joint of that finger.

Desire some one to double the number expressing the person, which, in this case, will give 8; bid him add 5 to this double, and multiply the sum by 5, which will make 65; then tell him to add to this product the number denoting the finger, that is to say, 6, by which means you will have 71; and, in the last place, desire him to multiply the last number by 10, and to add to the product the number of the joint, 2; the last result will be 712; if from this number you deduct 250, the remainder will be 462; the first figure of which, on the left, will denote the person; the next, the finger, and, consequently, the hand; and the last, the joint.

It must here be observed, that when the last result contains a cipher, which would have happened in the present example, had the number of the finger been 10, you must privately subtract from the figure preceding the cipher, and assign the value of 10 to the cipher itself.

THE GAME OF THE BAG.

To let a person select several numbers out of a bag, and to tell him the number which shall exactly divide the sum of those he has chosen:—Provide a small bag, divided into two parts, into one of which put several tickets, numbered 6, 9, 15, 36, 63, 120, 213, 309, &c.; and in the other part put as many other tickets, marked No. 3 only. Draw a handful of tickets from the first part, and, after showing them to the company, put them into the bag again, and, having opened it a second time, desire any one to take out as many tickets as he thinks proper: when he has done that, you open privately the other part of the bag, and tell him to take out of it one ticket only. You may safely pronounce that the ticket shall contain the number by which the amount of the other numbers is divisible; for, as each of these numbers can be multiplied by 3, their sum total must, evidently, be divisible by that number. An ingenious mind may easily diversify this exercise, by marking the tickets in one part of the bag, with any numbers that are divisible by 9 only, the properties of both 9 and 3 being the same; and it should never be exhibited to the same company twice without being varied.

THE CERTAIN GAME.

Two persons agree to take, alternately, numbers less than a given number, for example, 11, and to add them together till one of them has reached a certain sum, such as 100. By what means can one of them infallibly attain to that number before the other?

The whole artifice in this consists in immediately making choice of the numbers 1, 12, 23, 34, and so on, or of a series which continually increases by 11, up to 100. Let us suppose that the first person, who knows the game, makes choice of 1; it is evident that his adversary, as he must count less than 11, can, at most, reach 11, by adding 10 to it. The first will then take 1, which will make 12; and whatever number the second may add, the first will certainly win, provided he continually add the number which forms the complement of that of his adversary, to 11; that is to say, if the latter take 8, he must take 3; if 9, he must take 2; and so on. By following this method, he will infallibly attain to 89; and it will then be impossible for the second to prevent him from getting first to 100; for whatever number the second takes, he can attain only to 99; after which the first may say—"and 1 makes 100." If the second take 1 after 89, it would make 90, and his adversary would finish by saying—"and 10 make 100." Between two persons who are equally acquainted with the game, he who begins must necessarily win.

THE DICE GUESSED UNSEEN.

A pair of dice being thrown, to find the number of points on each die without seeing them:—Tell the person who cast the dice to double the number of points upon one of them, and add 5 to it; then, to multiply the sum produced, by 5, and to add to the product the number of points upon the other die. This being done, desire him to tell you the amount, and, having thrown out 25, the remainder will be a number consisting of two figures, the first of which, to the left, is the number of points on the first die, and the second figure to the right, the number on the other. Thus:

Suppose the number of points of the first die which comes up, to be 2, and that of the other, 3: then, if to 4, the double of the points of the first, there be added 5, and the sum produced, 9, be multiplied by 5, the product will be 45; to which, if 3, the number of points on the other die, be added, 48 will be produced, from which, if 25 be subtracted, 23 will remain; the first figure of which is 2, the number of points on the first die, and the second figure 3, the number on the other.

THE SOVEREIGN AND THE SAGE.

A sovereign being desirous to confer a liberal reward on one of his courtiers who had performed some very important service, desired him to ask whatever he thought proper, assuring him it should be granted. The courtier, who was well acquainted with the science of numbers, only requested that the monarch would give him a quantity of wheat equal to that which would arise from one grain doubled sixty-three times successively. The value of the reward was im-

mense; for it will be found, by calculation, that the sixty-fourth term of the double progression, divided by 1 : 2 : 4 : 8 : 16 : 32 : &c., is 9223372036854775808. But the sum of all the terms of a double progression, beginning with 1, may be obtained by doubling the last term, and subtracting from it 1. The number of the grains of wheat, therefore, in the present case, will be 18446744073709551615. Now, if a pint contain 9216 grains of wheat, a gallon will contain 73728; and, as eight gallons make one bushel, if we divide the above result by eight times 73728, we shall have 31274997411295 for the number of the bushels of wheat equal to the above number of grains: a quantity greater than the whole surface of the earth could produce in several years, and which, in value, would exceed all the riches, perhaps, on the globe.

THE HORSE-DEALER'S BARGAIN.

A gentleman, taking a fancy to a horse which a horse-dealer wished to dispose of at as high a price as he could, the latter, to induce the gentleman to become a purchaser, offered to let him have the horse for the value of the twenty-fourth nail in his shoes, reckoning one farthing for the first nail, two for the second, four for the third, and so on to the twenty-fourth. The gentleman, thinking he should have a good bargain, accepted the offer; the price of the horse was, therefore, necessarily great.

By calculating as before, the twenty-fourth term of the progression, 1 : 2 : 4 : 8 : &c., will be found to be 8388608, equal to the number of farthings the purchaser gave for the horse; the price, therefore, amounted to L.8738, 2s. 8d.

THE DINNER PARTY.

A club of seven persons agreed to dine together every day successively, as long as they could sit down to table differently arranged. How many dinners would be necessary for that purpose? It may be easily found, by the rules already given, that the club must dine together 5040 times, before they would exhaust all the arrangements possible, which would require above thirteen years."

GARDENING.—AUGUST, SEPTEMBER.

The operations of the gardener being nearly alike in August and September, may be noticed in one place. Runners of all sorts of strawberries must now be taken off and bedded out, if this has not been done already. Cut down all the last year's canes of such raspberries as have ripened their fruit. This will cause the young canes to grow stronger, ripen better, and be productive of finer and much better fruit than if left, according to the usual custom, till the plants are pruned in the winter or spring. Budding must be performed at this period, beginning with cherries, apricots, or plums, and continuing with nectarines, pears, and apples. Continue to nail up all fruit trees close to the wall, in order that the young wood may be properly ripened. Toward the middle of September cut off close to the principal shoot all such lateral side shoots of the vine as were before shortened back in one joint, as the principal eyes now will not push out any new shoots; this will give the plants air and light, and naturally assist in ripening both their wood and fruit. Protect the grapes from wasps and the large blue flies, by putting the bunches in thin gauze bags. In some seasons, particularly in hot and dry summers, wasps and flies are so numerous, that they attack every description of fruit as it becomes ripe. They may be destroyed very readily by hanging up bottles on different parts of the wall, with vinegar and water mixed with honey, sugar, or treacle, emptying the bottles from time to time, and returning the liquor into them again. Ants are also great devourers of ripe fruit. When they are numerous, they may be effectually destroyed by one quart of water in which an ounce of pounded arsenic has been boiled half an hour, and mixed with sugar, so as to form a syrup. This must be placed in oyster shells at the foot of the trees or bottom of the wall, covering them so as to keep off the rain; this will require to be frequently removed, and kept in a liquid state.

KITCHEN GARDEN.—Sow cauliflower and early purple brocoli for frames, lettuces, Flanders and prickly spinach, short-topped and turnip radishes. Plant out *covee tranchuda* in frames, the same as cauliflower, to be kept through the winter. Make mushroom beds in the mushroom-house, or under sheds, for winter crops. Plant out brocoli and winter greens. Earth up celery, cardoons, and tie up endive blanch. Prick out cabbage plants. Hoe out winter spinach to three or four inches distance from plant to plant. Pull up onions as soon as their tops are nearly dead, or they will push out fresh roots after rain, which will greatly injure their bulbs, and prevent their keeping in a sound and firm state to their usual period in the following spring.—*Lindley's Gardener's Calendar.*

EDINBURGH: Published by WILLIAM and ROBERT CHAMBERS, Booksellers, No. 19, Waterloo Place; and sold by all Booksellers in Edinburgh and every other town in Scotland.

Subscribers in town may have the Paper left at their houses every Saturday morning, by giving their addresses at 19, Waterloo Place. Price of a quarter of twelve weeks, 1s. 6d.; of a half year of twenty-four weeks, 3s.; and of a year, 6s. 6d. In every case payable in advance.

In LONDON, an Edition is published, with the permission of the Proprietors, by WILLIAM ORR, Paternoster-row, for circulation throughout England and Wales.

In DUBLIN, another Edition is published, with the permission of the Proprietors, by WILLIAM CURRY, Jun. and Company, Upper Sackville Street, for circulation throughout Ireland.

Typography executed by W. and R. CHAMBERS; stereotyped by A. KIRKWOOD; and printed by BALLANTYNE and COMPANY, Paul's Walk.

CHAMBERS' EDINBURGH JOURNAL

CONDUCTED BY WILLIAM AND ROBERT CHAMBERS, EDITORS OF "CHAMBERS'S HISTORICAL NEWSPAPER," AND "INFORMATION FOR THE PEOPLE."

No. 32.

SATURDAY, SEPTEMBER 8, 1832.

PRICE THREE HALFPENCE.

TALENT AND CONDUCT.

THERE is an idea prevalent, that want of worldly prudence is one of the most obvious marks of talent; and therefore many persons who wish to be thought possessed of ability think it necessary to take down a peg in their morality. What a degrading notion is this—what a miserable affectation! Talent without conduct is like a gilded boat unprovided with rudder or compass. It may make a fine show as it leaves the harbour; but whenever it gets into the open sea, it is found unfit for use, and perhaps leads its crew to destruction. On the other hand, nothing can be more worthy of admiration than talent accompanied by upright conduct and pure manners. In the one case the good faculty is worse than useless; while the folly and vice by which it is attended only show the more contemptible from their connection with so illustrious a quality. In the other instance, the praise of ability at least experiences no drawback. The individual gets the usual credit for his personal worth, and the homage due to his ability besides. But the more general disposition of men is to accord only the more admiration to talent, in so far as it goes hand in hand with virtue.

In an age when intellect is so active, and so many persons are constantly seeking to advance themselves by means of literature from the lower walks of life, it is of great consequence that right ideas should be entertained respecting the personal behaviour of men of genius. To suppose that extended powers of mind are likely to produce, or to be accompanied by, a blindness to the ordinary moral responsibilities, is, in my opinion, an absurdity. The more likely event is, that the man of talent is just the more able to appreciate and walk by the best precepts of conduct. It is true, we have some splendid instances of at least the poetical order of intellects, which distinguished themselves by a line of private conduct in no respect estimable. But not only are these mere exceptions; but, in all such cases, the fault might be traced either to some radical defect of character, or to a want of acquaintance with the world. I am here only alluding to the splendid instances where it is impossible to suppose *affectation*. But, in the great majority of cases, *that* is the key to the mystery. The truth is, that most vicious habits arise at first from affectation. There is not, I am persuaded, much plain honest sin, resulting from real impulse. The most of it is committed in imitation of something which we think fine. One silly fellow thinks it looks fine to be seen smoking cigars. Accordingly he smokes cigars. There is no trace of a love of tobacco in the whole vice. He only wishes to be seen with a cigar in his mouth. Another silly fellow's imagination is dazzled by the glories of the table; he accordingly drinks—not at all because he likes drink—but because he thought some other people looked uncommonly fine fellows when they were drinking, and so he must drink too. A third swears because he liked the sound of an oath one day in the mouth of a friend. In the same manner, the most of the instances which are pointed out, of men of talent who have become degraded by their vices, are in reality only pretenders, or little better, setting themselves with great anxiety to ruin themselves into a character for cleverness. Men of that kind are only worthy of pity. They are foolishly losing the good name of honest citizens, in order to gain—nothing. The fact is, that degraded habits are totally inconsistent with the exercise of the higher mental faculties. Instead of the fancy being bur-

nished, as many people suppose, by the use of liquor, it is deadened. Intoxication enchains and blunts the intellectual powers; and a man might just as well attempt to improve his dancing by tying up his legs, as think of writing better by means of a libation to the jolly god. I grant that liquor loosens the tongue considerably, and in general seems to brighten the hours of conversation. But its effect is quite different when the toper comes to paper. He then finds that the steady accurate exertion of mind which is required for composition is out of the question; and after writing a few sentences, which he knows, even in his blind state, to be incoherent and useless, he quits the pen in despair.

The proper end and use of an extraordinary degree of intellectual power unquestionably is the benefit of those who are less gifted. All talent which is not exerted for some purpose of this kind is useless, or worse. Now I am disposed to affirm that no man is truly capable of improving his fellow-creatures to a great extent, or even of supplying them with fanciful effusions that are calculated to *please without injuring*, unless his own personal character be rather above than below the average. The whole thoughts and sympathies of a man bear the complexion of his habits; and whence are we to expect manly thoughts or worthy sentiments, but from the mind and heart that are manly and worthy? Besides, there is much in personal example. I have always observed that the clergyman whose private life is irreproachable gains far more attention to his precepts, and oftener sees them reduced to practice, than he who has the misfortune to be otherwise. If a reader, for instance, were aware that a historical volume put into his hands was composed by a man notorious in private life for speaking without a regard to truth, would not his mind be haunted by that idea all the time he was perusing it, so as to prevent him in a great measure from trusting, and consequently from deriving any advantage from the work. Again, if the reader were to read a brilliant effusion of feeling or fancy, and be then told that, fine as it looked, it was the composition of a man who in reality had no heart—a cold, haughty, vain person, who plumed himself not only upon his abilities, but upon far more trivial and common-place distinctions—who forgot all to whom he had ever been obliged, even his near relations, on being elevated a little above them in society (if such a person *can* be really elevated)—would he not throw it away with contempt, and turn for relief to the simple virtues of some ordinary character, where much was neither given nor required?

The general truth unquestionably is, that talent can only be profitably exercised—can only appear properly to exist—when it is accompanied by correct conduct; and, with very few exceptions, those who appear to unite it with the reverse are only empirics, or men who have grasped at the shadow instead of the substance.

THE VICTIM OF FACILITY. SECOND INSTANCE.

IT is a common, but very vulgar notion, that legal practitioners are, as a class, selfish and faithless, even on the outlook for their own advantage, and for an opportunity of serving it, however nefarious, if it can only be made consistent with law. This may be true in particular instances: there are rascals in every profession; but, if matters were rightly understood, for every uniaithful *man of business*, as a law-agent is generally termed in Scotland, there are ten clients that would be unjust if they could; and for one charge

against men of business that proceeds on just grounds, ten at least, or ten hundred, proceed either in gross ignorance, or wilful, and often most ungrateful, misrepresentation. Men of business are no doubt responsible persons, and should be correct; but it is too much to insist that they should live constantly amid fire and remain unchanged; constantly liable to be injured, or, if they are successful in guarding against that, misrepresented, and not at last feel callous to the opinion of the world, and, even in defiance of that opinion, to look to themselves and their families. To expect the contrary is to expect in them a constant philosophy, and even a constant Christian feeling and forbearance, far beyond what might be expected, certainly beyond what would be experienced, in those who live by preaching the doctrines of philosophy and Christianity.

And such virtue is actually *often* found among men of business, in its most distinct form, and yet practised as an ordinary duty. After the most arduous and successful exertions, they are often left, not only without payment, but with the bitterest reproaches. Money liberally expended, and at the sacrifice of more lucrative modes of applying it, or with personal inconvenience, is often ungratefully denied, till denial is no longer possible, or the returns of their severe labour are withheld in the express view of compelling them to accept, from necessity, less than they ought to receive in justice. What is even more galling to a man of good feelings, the perverse client, after being preserved by one, runs to be destroyed by another, satisfied if that other can only assist in perpetrating an injustice against the man who had merited nothing but respect and gratitude. Yet all this they often experience, and all this they are accustomed to receive, not as a conduct they are to punish, but to guard against if they can. They express little resentment, perhaps none; but resorting to that law for their protection, without the aid of which they and their families would be ruined, their success in their own cause is termed oppression, and that ruin imputed to them which has been rushed upon by their opponents.

My acquaintance R.—had entered into business in early life. He had no connections but such as his talents and industry might bring him; but these soon became conspicuous, and were followed by the usual success. He was constantly occupied, and very seldom seen, except on business occasions, and then he was cheerful, yet placid; and his facility of apprehension being great, as his openness was proverbial, every one left him impressed at once with a sense of his talents and his integrity. He never affected doubts where he had none, nor sought to create business where no real business was to be done. The consequence was, he deprived himself of many small gains, which a more prudent or self-seeking man might have secured. But he obtained a reputation, that perhaps fully indemnified him, for quickness and liberality; his disdain of these petty gains being considered to proceed from principle, though it was only from constitution. Such as he was, he was envied by many, and respected by all who had occasion to know him; and his arrival at an early and respectable competence seemed certain.

While matters were in this state, a man bearing a recommendatory letter called upon him for his advice. Laying aside the business by which he was occupied, he read the letter, heard the story of the individual, and received his papers, desiring he might see him again, at what appeared a time when he might be prepared to give his opinion. The opinion was favourable to the man's views. His case was gone into, stated, gained for him; and here, if the matter had terminated as it ought, all would have been well. But while the business was in dependence, symptoms of oppression had been manifested towards the litigant, that excited the sympathy of his adviser. He had a wife and family, whose welfare, as well as his own comfort, depended upon evading these oppressions, and his adviser assisted him. In this way he became committed in his client's affairs. Oppressions conquered, were followed by others, all equally easily accounted for, and in appearance equally easy to be repressed. The involvement became greater, till in the end a general trust-assignment

(as it is called) was proposed and accepted. The client was to conduct his business with the assistance and under the guardianship of his trustee; and the trustee was to be secured and indemnified by the actual though only interim possession of the property of the trust, and by receiving the proceeds of his business.

In this way things proceeded as is usual in the outset of most undertakings. This was arduous; but the trustee had energy, and had calculated upon its use, expecting a fair reward for his trouble, besides the consciousness of having not only rescued a man and his family from unjust oppression, but restored both to comfort and independence. For several months the prospect was unclouded; the business proved lucrative beyond expectation, and the owner industrious and faithful. Engagements were therefore readily entered into by the trustee, where they seemed necessary, or promised to be profitable; and had the character of the individual proved as much to be depended on as his talents and the returns of his business, all would have been well.

But the man who had been recommended, and of whose character he had asked nothing beyond what the introductory letter, coupled with the justice of the transaction that had led to it, supplied, was in reality only a smooth rascal. With great talents, he appeared never to have turned them to any account beyond entrapping individuals of respectable character in succession, to support him so far, and, when he could carry them no farther, putting in practice all the devices of a villain who had from the beginning been on the outlook for materials of final annoyance or destruction.

The first intimation of this would seem almost to have been conveyed on purpose, by an associate of the individual, to whom he had boasted, that as he had destroyed several others who had attempted to resist his will, so he would now destroy the man who had raised him from beggary to respectability, if he did not submit to such terms of closing their connection as he should dictate. Mr R—— saw at once that if such was the character of the individual, he had gone too far. He determined to conceal all knowledge or suspicion of the trap that had been laid for him, and by every art that prudence would suggest endeavoured to retreat. But the suspicions of a villain are not to be evaded. He sees in the most obvious act of prudence or necessity a design to counteract the villainies of which he himself is conscious; and a system of these prudent measures, however carefully veiled, must at once drive to the same conclusion, that whether his plans are detected or not, they will be defeated, and nothing is left to him but to throw off the mask.

It would be painful to follow a villain through the maze of his treacheries or acts of heartless ingratitude, with a view to rob at once of fortune and reputation the man who had merited only his prayers, and whose only error had been in not spurning him from his door a beggar as he had entered it. It is enough to say, that he did throw off the mask, denying debt or favour, in the face of a thousand evidences, and resorting to all the chicanery, calumny, and deliberate dishonesty, that the worst character could be guilty of, to carry his purpose out; that he more richly deserved a thousand times to die on a gibbet, than the wretch who, in robbing on the highway, though he may ruin the fortune of the individual, yet leaves his character untarnished; and to the most atrocious crime, short of murder or violation, added the equally detestable, and, morally considered, more damning crime of the blackest ingratitude.
